We are glad to meet with a *Sonata for the Pianoforte and Violoncello*, op. 3, by Charles E. Horsley, since the work, from its form, claims respect and attention. Perhaps there is hardly a severer test of ingenuity, science, and knowledge of effect, than the composition of a classical *duo* in which the piano is to bear a part. Careful writing, or a command over the resources of counterpoint, will always make a stringed quartett respectable, even though the idea be somewhat trite, while, in a trio, the composer commands superior resources of contrast. Accordingly, we find a far greater number of passable compositions on the larger than on the more limited scale. The classical duets for piano and violoncello, which have stood the test of time, may be counted in a paragraph: beginning with Beethoven's three Sonatas—the last in A major, being the king of its tribe. His two later duets are rarely, if ever, to be heard; as they belong to the debateable time of his authorship, and not only the style, but the execution, demands the highest possible intelligence. Yet it would be well worth while for some pair of instrumentalists to study the second of the works in question—the Sonata in D major; since its two first movements have that grandeur of outline never reached by any other composer, for the sake of which may be forgiven the crudity of certain passages, and of the final fugue. Next in esteem to Beethoven's duets, may be named the two first of the three by Onslow. These are among their author's best piano-forte compositions; being less patchy than others we could mention, and full of those elegant ideas distinctive of the works produced in Onslow's golden age. In both, the rondo is the least happy portion; the composer being for the most part tedious when his labour draws to a close. Then we have Mendelssohn's Duet, which is now established as a favourite, though, taken as a whole, it is hardly one of his happiest inspirations. But the exquisite song, or serenade, or *notturno*, if we may so fancifully christen the middle movement, will keep its ground, we imagine, as long as players on the two instruments exist. There is a grand Sonata, by Ries, dedicated to Sir Herbert Taylor (grand in right of its passionate and well-contrasted first *allegro*; the slow movement, and the rondo *de ballet* which follow, being essentially meaner in their proportions) which must not be forgotten. The works of this clever composer, as we have often lamented, have been too universally laid aside, by reason of their inequality: yet one out of every ten, or thereabouts, is well worth rescuing and defending by every one who loves variety in chamber music better than his own prejudices. We have kept Hummel's Duet in A major for the end of the list, that we may close it gloriously. This is, indeed, one of its author's master-works, to be numbered—together with his *solo* Sonata in F sharp minor, one or two of his Concertos, as many of his Trios and his Septuor—among the choicest things in the pianist's library. Perhaps Hummel favoured his own instrument, at the expense of his partner, a little disproportionately; but for contrast betwixt movement and movement, for grace of melody and richness of texture, the work has few peers. After this, we had better not advert to certain of the recent German novelties, which, from time to time, have presented themselves. When we have announced that a Duet by Ferdinand Hiller (published, strange to say, at Milan, from whence Sibyls might augur much) contains a graceful *allegro*, and a bewitching and busy *scherzo*, which will torment every

Digitized by Google

pianist who is not as *light-fingered* as a Barrington's self, we may, with a clear conscience, try the worth of our new English contribution to a store so curiously meagre.

Bearing fully in mind that we have been speaking of *chefs-d'œuvre*, Mr. Horsley's Sonata deserves credit as a meritorious composition. The first *allegro* is a little undecided in style, and betrays what the author's favourite studies have been; the *andante* is more original and more coherent—the theme being terse, expressive, and pleasing; the movement, however, is, perhaps, too long-drawn. The *rondo* is at once bold and melodious, with natural yet unhackneyed modulations. Nor is the composition, like much young writing, impracticably difficult to execute. In short, it contains promise for the future as well as pleasure for the present moment. The time ought not to be far distant, when profit as well as praise should result to the authors of works in every point of view so creditable.

The enterprising publishers of Dr. Mendelssohn's productions have added to their catalogue a reprint of one of his earliest compositions, the *Sonata* for pianoforte *solo* in E major. We wish it was more the taste of the time to study such works; since the result must be some insight into design as well as detail, such as it is impossible to gather from any mere study, *notturno*, or operatic *fantasia*, however fashionable or difficult. One of the composer's peculiarities—namely, to make the several movements of his works melt into, rather than *succeed* each other,—is here curiously evidenced. The smooth *arpeggio* passage in the first *allegretto* is reproduced with graceful effect in the rhapsodical *intermezzo* which introduces the *finale;* and is once again inwrought into the close of the composition. The first movement is an excellent specimen of the *legato* style; and the *molto allegro* grand and bold, with a touch of dashing audacity, reminding us of the symphony to the opening chorus in Weber's 'Euryanthe,' or the same composer's march in 'Oberon.'

MISCELLANEA

Mr. James Hakewill.—Died at his apartments in Adam-street West, Bryanstone-square, May 28, in his 65th year, James Hakewill, architect. This gentleman was principally known by publications on architectural antiquities and the fine arts. His first work was a novel, entitled 'Cœlebs suited; or, the Stanley Letters,' 1812. In 1813 he produced a large volume in imperial 4to. called 'The History of Windsor and its Neighbourhood,' with twenty-one engravings and fourteen vignettes from his own drawings, price five guineas. The views were from his own pencil. It was well received at the time, and many years after he was much gratified on receiving the thanks of Sir Jeffry Wyattville for the publication, coupled with the assurance that, in his alterations in that abode of royalty, he had endeavoured to carry out his suggestions. When the general peace opened the Continent to English travellers, he went to Italy, accompanied by his wife, whose taste and talents qualified her thoroughly to enjoy all the beauties of nature and art that were displayed before them, and there they passed the greater part of the years 1816 and 1817, which afforded the materials for a 'Picturesque Tour of Italy,' which was published, with sixty-three plates, in twelve parts quarto and folio, 1818–1820, illustrated by parallels of Dorton House, Hatfield, Longleat, and Wollaton, in England; and the Palazzo Della Cancellaria, at Rome. This is an interesting work, both in its literary matter and in illustrations. Among the latter are some engravings from fine drawings by Turner, one of which, a composition of Roman edifices, surpasses any picture by Pannini. This work was brought out with great care, and immediately obtained a high rank in the estimation of the public, which it is well qualified to retain, as, for accuracy of delineation, and excellence of engraving, it does not yield to any that sprung from that fruitful field. In 1825 he published, in folio, 'A Picturesque Tour in the Island of Jamaica, from drawings made in the years 1820 and 1821.' In 1828, 'Plans, Sections, and Elevations of the Abattoirs of Paris, with consideration for their adoption in London,' 4to. In 1835, 'An Attempt to determine the exact Character of Elizabethan Architecture,' 8vo. In the year 1840 he was engaged in furnishing drawings for a projected work on the Rhine, which it was intended should have been a counterpart to his 'Italy,' but which has never been published, the drawings remaining in the hands of the engraver.—*Gentleman's Mag.*

Electrotypes.—A paragraph in your paper of the 29th of July, copied from the *Gardeners' Chronicle*, states that some beautiful specimens of the application of the electrotype process to vegetation were exhibited by Messrs. Elkington, of Regent Street; and, further, that this opened a *new* view and most interesting field to the application of the electrotype process: I beg to inform you that Mr. Cox (of Islington), in *May* last, at the Royal Institution, in Albemarle Street, exhibited sundry specimens of electrotyped plants and flowers. This induced me to wait upon Mr. Cox, who showed me various other specimens of the most delicate texture, and informed me that he had been making them for some months previously. I beg to enclose my name and address, but subscribe myself ALPHA.

A Fire-proof Powder Magazine.—The *Times* mentions that an experiment took place on Wednesday at Paine's wharf, Westminster, for the purpose of testing the capabilities of a magazine to contain powder in ships of war, recently patented by Mr. J. A. Holdsworth, as being impervious to fire, though subjected on all sides to the greatest possible degree of heat. A model of a magazine, about nine feet square, was placed on the wharf within a few feet of the water's edge. This model is formed of a double set of thin iron plates, riveted together at about two inches and a half asunder, the hollow being filled with water and supplied from a vat placed somewhat above the level of the magazine and entering it through a pipe inserted in the lower part of the model. A channel of communication exists through every side as well as the top and bottom, and from the upper surface a second pipe conveys the stream of water back to the vat from which it is supplied. The door of the magazine is hung on hinges, made hollow, and guarded from leaking by stuffing boxes, so that the water flows into the door through one hinge and out through the other. The patentee having explained the principle of his invention, placed a quantity of combustible matter within the model, over which some gunpowder was laid on a sheet of paper. A registering thermometer having been placed inside, the door was closed and a stack of dried timber deposited on every side of the model, was set a-light. The fire was kept up more than half-an-hour, and the water rose to very nearly boiling heat, continually passing in a stream through the upper pipe into the reservoir containing cold water. On the door being opened, the combustible matters and powder were found to be perfectly uninjured, and the highest point to which the mercury had risen within the model was marked at 100 degrees of Fahrenheit. A somewhat similar principle has been applied to the stoker's room in the *Victoria and Albert* royal steam yacht, where the bulkheads have been constructed of two plates of sheet iron, instead of wood faced with iron, a stream of water constantly flowing between, by which means the temperature of the engine room is kept cool.

Thunder-storm.—On Tuesday and Wednesday last terrific thunder-storms, of which the only trace in London was a succession of brilliant sheet lightning, visited several parts of England. At Rochester hailstones fell which measured an inch and a half in length, and the roaring sound of the rain and hail is described as equal to the noise of the thunder itself. At Cheltenham and Stamford the storm was also very severe. At Worcester it continued for nearly six hours, and the roads were flooded up to the body of the carriages. It appears, however, to have burst with most violence over Cambridge, where hailstones are said to have fallen as large as pullets' eggs. The town was completely inundated, and Trinity Church, King's College Hall, and the north end of Trinity Hall have been much damaged. At nearly all these towns the lightning appears to have struck some high building, and done much damage.

Roman Antiquities.—An antique silver vase of great beauty, and covered with bas-reliefs, has been discovered at Tourdan, in the arrondissement of Vienne. It is semi-oval, and sixteen centimètres high, with allegorical representations of the seasons, &c. Several consular coins, and a bronze statue of Venus had been previously discovered in the same village.—At the village of Werden, in the neighbourhood of Cologne, on the high road to Aix-la-Chapelle, the grave of a Roman general has been discovered in good preservation. In it have been found several coins, and one of the reign of Vespasian, A.D. 70. There are also three marble statues, and two elaborately carved seats, likewise of marble.

In 8vo. price 5s. 6d.

A PRACTICAL INTRODUCTION to LATIN VERSE COMPOSITION.

Contents: 1. 'Ideas' for Hexameter and Elegiac Verses. 2. Alcaics. 3. Sapphics. 4. The other Horatian Metres. 5. Appendix of Poetical Phraseology, and Hints on Versification.

Just published, price 14s., the Sixth Volume of

THE HISTORY of the REIGN of GEORGE the THIRD. By JOHN ADOLPHUS, Esq. The whole to be completed in 8 vols.

London: John Lee, 440, Strand.

NORTH BRITISH INSURANCE COMPANY, 4, New Bank-buildings, and 10, Pall Mall East.

His Grace the Duke of Sutherland, *President*.
Sir Peter Laurie, Alderman, *Chairman of the London Board*.
Francis Warden, Esq. (Director H.E.I.C.) *Vice-Chairman*.
John Webster, M.D. 24, Brook-street, *Physician*.

LIFE DEPARTMENT.—This Institution is incorporated by Royal Charter, and is so constituted as to afford the benefits of Life Assurance in their fullest extent to Policy-holders, combined with perfect security in a fully subscribed Capital of One Million, besides an Accumulated Premium Fund of Three Hundred and Fifty-five Thousand, and an Annual Revenue, from Life Premiums alone, of Eighty-two Thousand Pounds.

The last Bonus declared averaged 37 per cent. on the premiums paid. The next appropriation of profits will be made in December, 1844; and persons who now insure will participate therein according to the number of annual premiums paid in the interval.

FIRE DEPARTMENT.—Insurances against Loss by Fire may be effected at the Company's Western Branch Office, 10, Pall Mall East, on Private Houses, Country Mansions, Furniture in the same, and Farm Steadings, at the lowest rates of premium corresponding to the risk.

Prospectuses, containing Tables of Rates, and a full List of the Directors, &c. who are all responsible *Partners*, may be obtained on application to Messrs. B. and M. Boyd, Resident Members of the Board, 4, New Bank Buildings; or to the Actuary, Mr. John King, 10, Pall Mall East.

JOHN KING, Actuary.

NATIONAL LOAN FUND LIFE ASSURANCE, ANNUITY, and DEFERRED ANNUITY SOCIETY, 26, Cornhill, London.—Capital, 500,000*l.*—Empowered by Parliament.

Directors—T. LAMIE MURRAY, Esq. *Chairman*.

John Elliotson, M.D. F.R.S.	George Lungley, Esq.
John Griffith Frith, Esq.	John Rawson, Esq.
H. Gordon, Esq.	Clement Tabor, Esq.

Joseph Thompson, Esq.

Auditors—Prof. Wheatstone, F.R.S.; Prof. Graves, A.M. F.R.S.
Actuary—W. S. B. Woolhouse, Esq. F.R.A.S.

The superior advantages to those Assured with this Society will be best understood by a comparison of its principles and a reference to the last Annual Bonus declared on Policies of five years' standing, viz.:

Entry	Policy No.	Age	Sum	Annual Premium.	Bonus added.	Cash Bonus.	Premium reduced.
			£	£ s. d.	£ s. d.	£ s. d.	£ s. d.
1837	39	59	1000	67 8 4	132 14 6	58 19 9	8 19 4
1838	114	56	3000	175 15 0	296 9 7	123 0 6	16 9 7

Policies now entered upon entitled to participation in next Annual Division. Two-thirds of all premiums paid can be borrowed by the assured without loss of Policy.

F. FERGUSON CAMROUX, Secretary.

WESTERN LIFE ASSURANCE SOCIETY, 49, Parliament-street, Westminster.—Capital 500,000*l.*

Directors.

Henry Edgeworth Bicknell, Esq.	John Arscott Lethbridge, Esq.
William Cabel, Esq.	Edmund Lucas, Esq.
Thos. Somers Cocks, jun. Esq.	George Kennet Pollock, Esq.
George Henry Drew, Esq.	James Lys Seager, Esq.
William Evans, Esq.	John Bazley White, Esq.
William Freeman, Esq.	Joseph Carter Wood, Esq.
Francis Fuller, Esq.	Henry Wrench, Esq.
James Hunt, Esq.	

Physician—William Richard Basham, M.D.
Surgeons—Alfred Leggatt, Esq.; George D. Pollock, Esq.
Bankers—Messrs. Cocks, Biddulph & Co.
Solicitors—Messrs. J. L. Bicknell and J. C. Lethbridge.

The leading features of this Society are—

The very moderate Rate of Premium when viewed as combined with *perfect security* to the assured.

The advantage to the Assurers (by Table 2) of becoming entitled to *three-fourths* of the *profits*.

The assurance of a *certain bonus*.

The facility for *securing debts*.

The allowance of *half* the Annual Premium to remain unpaid for *seven years*, and

The accommodation of *temporary loans* to the Assured on available security. Immediate and deferred Annuities are granted by this Society on terms advantageous to the Public.

A liberal Commission allowed to Professional Gentlemen and Agents introducing business to the Office.

EDWARD T. RICHARDSON, Secretary.

SCOTTISH (WIDOWS' FUND) LIFE ASSURANCE, founded A.D. 1815, upon the principle of Mutual Contribution. Constituted by Act of Parliament. THE WHOLE SURPLUS FUNDS which remain after making provision for the claims of the Society, BELONG TO THE ASSURED.

At 31st December, 1838, it was ascertained on investigation, that the Surplus Fund amounted to very nearly 280,000*l.*, and it was sufficient to enable the Directors, after setting aside upwards of 90,000*l.* as a Guarantee Fund, to declare and provide for the following additions:—

1. An addition at the rate of Two per Cent. per annum, for the period from 31st December, 1831, or 14 per Cent. on the *accumulated* amount of the original Sums assured, and the previously declared additions; or about 19 per Cent. on the Capital Sum assured by the early Policy holders.

And in order to provide for the case of those parties who may die before 31st December, 1845, when the next investigation and declaration of Surplus is made, there was provided further—

2. An addition at the rate of Two per Cent. per annum, on the *accumulated* amount of the original Assurance, and *previously* declared additions, for each Premium that may be paid after 31st December, 1838, provided the party die before 31st December, 1845, having been insured at least five years, this addition, supposing the case of a party insured in the early years of the Society's existence, to die after payment of the premium for the year 1845, would be for the 7 years from 31st December, 1838, to 31st December, 1845, upwards of 21 per Cent on the original Assurance.

Thus, if a party aged 20 had assured for 1000*l.* in the year 1818, and were to die after payment of the premium for 1845, being then aged 47, his representatives would get no less than

£1809 8*s.* 7*d.*

If he had assured in 1825, when 27, and died at 47, they would be then entitled to £1436 1*s.* 2*d.*

If he had assured in 1830, when 32, and died at 47, they would be entitled to £1338 11*s.* 9*d.*

The proportion of the Surplus Fund allocated to each Policy, may be applied towards REDUCTION OF THE FUTURE PREMIUMS, and if desired, the party may BORROW UPON THE SECURITY OF HIS POLICY, to the extent of nine-tenths of the *value* (not the amount.)

Capital accumulated and invested, upwards of ONE MILLION THREE HUNDRED THOUSAND POUNDS. Annual Revenue upwards of TWO HUNDRED THOUSAND POUNDS.

HEAD OFFICE, EDINBURGH, 5, St. Andrew-square.
JOHN MACKENZIE, Manager.

LONDON OFFICE, 7, Pall Mall.
HUGH M'KEAN, Agent.

FREEMASONS' and GENERAL LIFE ASSURANCE COMPANY, 11, Waterloo-place, Pall Mall, London.

Business transacted in all the branches and for all objects of LIFE ASSURANCE, ENDOWMENTS and ANNUITIES, and to secure CONTINGENT REVERSIONS, &c. Loans granted. Information and Prospectuses furnished by

JOSEPH BERRIDGE, Secretary.

PROMOTER LIFE ASSURANCE and ANNUITY COMPANY, 9, Chatham-place, Blackfriars, London. Established in 1826.

This Society is supported by an ample subscribed capital, and by a considerable accumulated premium fund.

Assurances are effected at a low rate of premium, without profits, or at an increased premium, with participation in the profits of the Office.

A Bonus in ready money, at the rate of 15 per cent. on the premiums received (equivalent to a reversionary bonus of about 30 per cent.) was declared in May last, on all beneficial policies on which three annual premiums had been paid in December, 1841.

A division of the profits takes place every five years, and the holders of beneficial policies can receive their bonuses in ready money, or have them applied in augmentation of their policies, or in reduction of their future premiums.

Assurers may contract to pay their Premiums either in one sum, in a given number of payments, in annual, half-yearly, or quarterly payments, *or on the ascending or descending scale*.

Officers in the Army and Navy on active service, persons afflicted with chronic and other diseases, and such as are going beyond the limits of Europe, are also assured at moderate rates.

Prospectuses and all necessary information may be obtained at the Office.

MICHAEL SAWARD, Secretary.

BRITANNIA LIFE ASSURANCE COMPANY, 1, Princes-street, Bank, London.

This Institution is empowered by *Special Act of Parliament*, (4 Vict. cap. 9), and is so constituted as to afford the benefits of Life Assurance in their fullest extent to Policy-Holders, and to present greater facilities and accommodation than are usually offered by other Companies. The decided superiority of its plan, and its claim to public preference and support, have been proved incontestibly, by its extraordinary and unprecedented success.

Assurances may either be effected by Parties on their own Lives, or by Parties interested therein on the Lives of others.

The effect of an Assurance on a person's own life is to create at once a property in reversion, which can by no other means be realized. Take, for instance, the case of a person at the age of thirty, who by the payment of 5*l.* 3*s.* 4*d.* to the Britannia Life Assurance Company, can become at once possessed of a bequeathable property, amounting to 1000*l.*, subject only to the condition of his continuing the same payment quarterly during the remainder of his life,—a condition which may be fulfilled by the mere saving of EIGHT SHILLINGS weekly in his expenditure. Thus, by the exertion of a very slight degree of economy —such, indeed, as can scarcely be felt as an inconvenience, he may at once realize a capital of 1000*l.*, which he can bequeath or dispose of in any way he may think proper.

Detailed Prospectuses, and every requisite information as to the mode of effecting Assurances, may be obtained at the Office.

PETER MORRISON, Resident Director.

A Board of Directors attend daily at 2 o'clock, for the dispatch of business.

PELICAN LIFE ASSURANCE OFFICES, 70, Lombard-street, and 57, Charing-cross.—Established 1797.

Directors.

Matthias Attwood, Esq. M.P.	Sir W. Heygate, Bart.
W. Stanley Clarke, Esq. F.R.S.	Kirkman D. Hodgson, Esq.
John Coope, Esq.	R. Henshaw Lawrence, Esq.
William Cotton, Esq. F.R.S.	J. Petty Muspratt, Esq.
Sir William Curtis, Bart.	George Shum Storey, Esq.
William Davis, Esq.	C. Hampden Turner, Esq.
J. A. Gordon, Esq. M.D. F.R.S.	Matthew Whiting, Esq.

The Plan of this Office will be found to comprise all the Solid Advantages of Life Assurance.

Persons have the option of insuring upon the Return or Non-Return Systems; and the Tables, which include Ascending and Descending Scales of Premium, have been framed to suit the convenience of all parties.

The Rates have recently been reduced agreeably to the most approved calculations; they are also verified by the experience of the Office during Forty Years, and are as low as consistent with safety; those adapted to the RETURN SYSTEM entitle its assured to an equitable participation in the surplus premium, according to the plan detailed in the Company's prospectus.

The Assured under both Systems will possess the guarantee of a large PAID-UP Capital, and the further security of a responsible body of Proprietors, without being exposed to the liabilities of partnership.

Policies are purchased on liberal terms when the object of an assurance is effected;—or, loans will be granted thereon to the extent of five-sixths of such purchase-money.

Prospectuses and every information obtained on application at the Offices as above, or to the Agents of the Company appointed in every City and principal Town in the Kingdom.

R. TUCKER, Secretary.

UNITED KINGDOM LIFE ASSURANCE COMPANY, 8, Waterloo-place, Pall Mall, London.

Division of Profits among the Assured.

Directors—Jas. Stuart, Esq. *Chairman*.
Hananel De Castro, Esq. *Deputy Chairman*.

Samuel Anderson, Esq.	Charles Graham, Esq.
Hamilton Blair Avarne, Esq.	F. Charles Maitland, Esq.
Edw. Boyd, Esq. *Resident*	William Railton, Esq.
E. Lennox Boyd, Esq. *Assist. Resident*	John Ritchie, Esq.
Charles Downes, Esq.	F. H. Thomson, Esq.

Secretary—Patrick Macintyre, Esq.

This Company, established by Act of Parliament, affords the most perfect security in an ample paid-up Capital, and in the great success which has attended it since its commencement in 1834. In 1841, the Company declared an addition to the Shareholders of one-half of their Stock, and also added 2*l.* per cent. per annum, from the date of the policies to those parties who had insured with profits. The premiums, nevertheless, are on the most moderate scale, and only a moiety need be paid for the first five years, where the Insurance is for life.

The amount of bonus added to policies since the commencement of the Company in March, 1834, to the 31st Dec. 1840, is as follows:

Sum Assured.	Time Assured.	Sum added to Policy.
£1000	6 Years 10 Months	£136 13 4
1000	4 Years	80 0 0
1000	3 Years	60 0 0
1000	1 Year	20 0 0

Every information will be afforded on application to the Resident Directors, Edward Boyd, Esq. and E. Lennox Boyd, Esq., of No. 8, Waterloo-place, Pall Mall, London.

EDWARD GILBERTSON, Secretary.

Prospectuses, and every other information, may be obtained by applying at the Offices, No. 24, Lombard-street, City.

PERFECTLY NEW AND UNIQUE PATENT BEDSTEADS.

H. PRATT respectfully solicits the particular attention of the Nobility and Gentry furnishing, and Officers joining their regiments, to the PATENTED TAPER METALLIC DOVETAIL JOINTED BEDSTEADS, which he has made arrangements with the Patentees to introduce to their notice. It is long since so necessary and useful an improvement has been invented, and one more especially deserving their notice. The facility with which they are fixed up and taken down in a few minutes, without the use of tools—the elegant and light appearance—the firmness of construction, and the utter impossibility of annoyance from insects,—all join to render them paramount to any other ever invented. The PATENT ELASTIC SPRING BEDS, &c. and complete Fittings, supplied in plain and decorative appointments. Now on view at H. Pratt's Trunk and Military Outfit Warehouse, 123, New Bond-street.

MOULD CANDLES to BURN WITHOUT SNUFFING.—KEMPTON'S PATENT.—These candles do not require snuffing; they burn longer and are cheaper than any other candle; the flame is steady and brilliant. No metallic or deleterious matter is used in the manufacture. Price 8*d.* per lb. Sold by G. E. Parish, agent for exportation, 21½, Bread-street, City, and by Slodden & Stocking, 42, High-street, Marylebone; W. Gethem, Broadley-terrace, Blandford-square; W. Evans, Italian warehouse, Greenwich; John Hawkins, grocer, High-street, Whitechapel; George Hawley, grocer, Pitfield-street, Hoxton; S. Game, Fish-street-hill; J. Pain, grocer, Bethnal-green-road; G. H. Hudson, 229, Blackfriars-road; C. H. Nicholas, 19, Bolingbroke-row, Walworth; and at the manufactory, Old Bargehouse, Christchurch, Surrey.

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1*s.* An improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian Bristles, which do not soften like common hair. Flesh-Brushes of improved graduated and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, Oxford-street, two doors from Holles-street.

CAUTION—Beware of the words "From Metcalfe's" adopted by some houses.

MESSRS. BARRY & SON, Stationers and Engravers, beg to inform the Nobility and Gentry that they are now enabled to PRINT ARMS, CRESTS, &c., for book plates, in their proper heraldic colours, and at very moderate prices. Crests engraved on visiting cards in the first-rate style, 6*s.*; without the crest, 2*s.* 6*d.*; and 100 cards, 2*s.* 6*d.*: also every description of elegant engraving. Specimens of the above may be selected from a large and fashionable assortment, at their warehouses, Egyptian Hall, Piccadilly, and 122, Bishopsgate-street Within, or sent on application any distance free of expense. Superfine letter papers, 27*s.*, 22*s.*, 20*s.*, 18*s.*, 17*s.*, 14*s.*, 12*s.* and 8*s.* per ream; Note ditto, 18*s.*, 16*s.*, 12*s.*, 8*s.*, 6*s.* and 4*s.* per ream. An additional charge is made for stamping either of the above with arms, crest, coronet, or initials. Their miscellaneous stock, which is very large and particularly adapted for presents, consists of dressing cases, writing desks, inkstands, envelope cases, albums, blotting-books, bibles and prayers, gold and silver pencil cases, penholders, toilet and smelling bottles, souvenirs, ladies' companions, sachets, card and glove cases, pocket-books, papeterie, and envelopes, suitable for invitations, complimentary notes, weddings, &c. Either of the above articles may be had plain, or of the most costly description, with every description of useful stationery. Postage stamps and envelopes at Government prices. Messrs. Barry & Son are also the West-end Agents for Mr. Robert Best Ede's Perfumery.

WATCHES by WEBSTER & SON, Chronometer Makers to the Lords of the Admiralty (Established 132 years), 3, BIRCHIN-LANE. The largest assortment of fine Second-hand Watches of any house in London, by the most eminent makers—many nearly equal to new, and at little above half their original cost, all of which W. & Son warrant. They consist of fine Repeaters, Duplex, Lever, and Horizontal Escapements, all of superior manufacture. New Watches of the most elegant patterns upon the principle of their Chronometers, to which the Government awarded the prizes three years in succession, with compensation balances to counteract the variations of temperature. Also a large assortment of Lever and elegant Horizontal Watches, for Ladies and Gentlemen, at considerably reduced prices. Old Watches taken in exchange. The most experienced workmen are employed on the premises in the repairing department.

Webster & Son, 3, Birchin-lane, Cornhill.

THE APERITIVE FOUNTAIN being distinguished by the favour of Royalty and honoured by the patronage of the nobility, the Medical profession, and all who have experienced its effects as a substitute for physic, W. PINE, (authorized by Dr. Scott, the inventor,) considers himself warranted in recommending it to every family, and more especially to those who from costiveness, indigestion, and other disorders of the stomach, liver, &c., are victims to the habitual use of purgatives. The apparatus is an elegant vase, so small that, filled with water, it may be carried in the pocket to the place for using it conveniently, where it instantly procures the desired relief. Nothing but water is required, and its operation is as effective as a dose of opening medicine. The fountain may be used by the most nervous lady without the aid of any second person. Also, Dr. Scott's SONIFERS, (for restoring hearing to deaf persons) graduated upon scientific principles to suit the deafness of each individual. Descriptions sent post free; and the Fountains and Sonifers forwarded to any part of the kingdom by W. PINE, Superintendent, 369, Strand, three doors from Exeter Hall.

NORTON'S CAMOMILE PILLS are confidently recommended as a simple, but certain remedy, to all who suffer from Indigestion, Sick Headach, Bilious and Liver Complaints; they act as a powerful tonic and gentle aperient, imparting strength to the stomach, and composure to the nervous system. Sold in bottles, at 1*s.* 1½*d.* or 2*s.* 9*d.* each, by A. Willoughby & Co., late B. G. Windus, 61, Bishopsgate Without; and nearly all Medicine Venders.

THOUGHTS on MORAL and SPIRITUAL CULTURE.
By R. C. WATERSTON.
"This volume is full of excellent hints on practical life and the cultivation of the character, copiously illustrated with anecdotes, drawn from various sources, and with analogies from all the provinces of nature and fancy. The book is interspersed with mottos and quotations of rare beauty and pith."—*Rev. E. S. Gannett's Monthly Miscellany.*
London: John Green, 121, Newgate-street.

In 2 vols. 8vo. Maps and Plates, price 24s.
ROME, as it was under PAGANISM, and as it became under the POPES.
"This is a very remarkable work; an erudite, conscientious, and eloquent dissertation. The author—be he Protestant or Catholic—has succeeded in producing, on the decline and fall of the Roman Empire, and the reproduction, under new forms of Roman influence by the Popes and the Church, an original and most valuable work."—*Tablet*, July 30.
"His capacious mind has grasped his subject; his comprehension is expansive—his conceptions warm, rich, and glowing—his research extensive. We recommend this work to the world."—*Metropolitan Magazine*, August.
London: J. Madden & Co. 8, Leadenhall-street. Dublin: J. Cumming.

This day is published, in 8vo. price 12s.
EXTRACTS from the MUNICIPAL RECORDS of the CITY of YORK, during the Reigns of Edward IV., Edward V., and Richard III., with Notes Illustrative and Explanatory; and an Appendix, containing some Account of the Celebration of the Corpus Christi Festival at York in the Fourteenth, Fifteenth, and Sixteenth Centuries.

Now ready, 8vo. 8s.
SELECTIONS from the DRAMAS of GOETHE and SCHILLER. Translated, with Introductory Remarks, by ANNA SWANWICK.
"The fair translator has gone to her beautiful task in the right spirit, adhering to the words of the original with fidelity, and evidently penetrating the mind of the poet." "The translations are very beautiful, and while they will serve to make the mere English reader acquainted with two of the most perfect works ever written—the 'Iphegenia,' and the 'Tasso'—they will form useful assistants to those who are commencing the study of the German language."—*Foreign Quarterly Review.*
Sold by John Murray, Albemarle-street.

Fifth Edition, now ready,
ORION, an EPIC POEM, in Three Books. By R. H. HORNE, Author of 'Cosmo de Medici,' 'Gregory VII.', &c. 8vo. pp. 137, price 2s. 6d.
To prevent any misconceptions as to the alteration of the price, the Publisher begs to state that the Author having directed him to print and publish three entire editions of 'Orion' at the price of One Farthing, allowed it to be raised to One Shilling; in the advertisements of which it was distinctly stated that the price would again be raised to Half-a-crown for the same work, and without any alteration in its appearance. Accordingly, the Fourth edition being exhausted, the Fifth is now announced, price 2s. 6d.; and in the same manner as before, it is hereby as distinctly stated again, that the price of the same work, without any illustrations, vignettes, fine paper, or other ornaments, will be raised to 5s. in a subsequent edition.
J. Miller, 404, Oxford-street.

Now ready,
AN APPEAL to the BRITISH NATION in BEHALF of COL. STODDART and CAPT. CONOLLY, now in CAPTIVITY at BOKHARA.

BRITISH AND FOREIGN STUDIO for ART and SCIENCE, to OPEN 2nd of OCTOBER NEXT. Its purpose being,—
1st. To offer a most liberal and complete Education, both theoretical and practical, for young Gentlemen intending to follow the important profession of Architect or Civil Engineer.
2nd. To afford any degree of similar Instruction to Gentlemen not choosing the above profession, but aiming at various other eminent situations in society, as Counsel in Committee, Art-Commissioners, Distinguished Travellers, or Connoisseurs, and men who desire a true developed taste and judgment in general.
3rd. To constitute an office where any design (in preference original) may be undertaken (within the province of both professions), of which the public may be in demand, and where drawings may be executed in the highest style of Art.
A choice Library will be at the service of the Members, where they may satisfy any curiosity in Art or Science.
The morals of the Pupils will also be strictly attended to.
Premium to be paid in proportion to the amount and duration of Instruction.
The Studio to be situated in the vicinity of Regent-street, but applications to be made at 6, Lincoln's Inn-fields.
CARL TOTTIE, Architect and Civil Engineer.
16th Aug. 1843.

DRAWING CLASSES for TRADESMEN, MECHANICS, and OTHERS. Terms 6d. for an hour's Lesson.—Mr. GANDEE, Professor of Perspective, Drawing, &c. respectfully informs his friends and the public that he has OPENED a DRAWING ACADEMY at No. 36, Bedford-street, Strand, near Charing-cross, where he intends to give LESSONS on the new and successful method of Drawing from Models. Classes, both Afternoon and Evening, will be opened in a few days.—Tickets and further particulars may be obtained as above. Schools and Private Families attended on moderate terms. The large room to be let for other Classes, &c.

MR. AUG. KRANTZ, of Berlin, respectfully informs his Customers and Friends that he will be prevented from attending (this year) the Meeting of the British Association at Cork, but requests the favour of their commands to be addressed to him as usual, to the care of Mr. Pamplin, 45, Frith-street, Soho-square.
A. K. also takes the present opportunity of mentioning that his new priced CATALOGUE of Mineral and Geological Specimens is now ready, and may be had, as above, by a pre-paid application, enclosing two penny stamps.
Berlin, Aug. 5, 1843.

Prince Albert, His Majesty the King of the French, His Majesty the King of Denmark, The Marquis of Northampton, The Grand Duke of Tuscany, and most of the Natural History Societies of England and the Continent; in Monthly Numbers, with text, and figures of the natural size, price 10s. each Number, coloured. No. 8 on the 1st September.

THE LINNÆAN LITHOGRAPHIC PRESS.—The art of chemical printing, either lithographic or zincographic, having greatly superseded the use of copperplate printing for Natural History Illustration, on account of its economy and peculiar softness for colouring, it has become necessary that this important department of the art should be practised exclusively by one who would conduct it with the zeal and discrimination of a naturalist. The Author of the 'Conchologia Iconica' begs respectfully to announce that he has now in operation the most complete lithographic apparatus ever imported into this country, and having used it with great economy and success for the printing of his own drawings, is now ready to execute the most simple or elaborate subjects on Botany, Zoology, Geology, or any of the Natural Sciences, at a cheaper rate than has been hitherto attained. Engravings transferred from copper to stone. Estimates given either for the entire illustration of a subject, including use of stones or zinc plates, drawing, printing, colouring, &c.; or for the printing only.
Lovell Reeve, Naturalist and Scientific Lithographer, 8, King William-street, Strand.

RECONNOITERING TELESCOPES.—These beautiful Instruments, measuring but 3½ inches when closed, possess sufficient power to show clearly Jupiter's moons, price 35s., securely packed and sent through the post for 1s. To be had only of the maker, JOHN DAVIS, Optician, Derby; or at the establishment of his brother, High-street, Shrewsbury.

OFFICE for PATENTS of INVENTIONS and REGISTRATION of DESIGNS, No. 14, Lincoln's Inn-fields, where all business relating to the Securing and Disposing of BRITISH and FOREIGN PATENTS, Preparation of Specifications, Drawings of Inventions, is expeditiously and economically effected.
Also REGISTRATIONS under the New Consolidated Copyright of Designs Act, 5 & 6 Vict. cap. 100.
A Prospectus, containing much useful information, may be obtained, and references to an Alphabetical List of Patents and Registrations made, on application to Mr. Alexander Prince, 14, Lincoln's Inn-fields.

PREMIUM of THIRTY GUINEAS.—TO ENGINEERS, MECHANICS, INVENTORS, &c. &c.—NOTICE IS HEREBY GIVEN, that the Committee of the Practical and Scientific Association for the Promotion of Improved Street Paving, Cleansing, Drainage, &c. &c., No. 20, Vere-street, Oxford-street, have resolved on offering a Premium of a Gold Medal of the value of Thirty Guineas, or the like award in money, for the best and most approved mode for effectually Cleansing the Public Streets, combining the following requisites—viz. Convenience, Efficiency, and Economy. Plans and descriptions are to be sent in on or before the 1st of March, 1844, in sealed covers, bearing a motto, and accompanied with a letter, enclosing the name and address of the competing party. A PRACTICAL Demonstration of the method proposed to be adopted will be required. The field of competition is equally open to Foreigners in any part of the World.
By order, J. N. G. GUTCH, Secretary.

Sales by Auction.

PHILOSOPHICAL APPARATUS, OBJECTS OF NATURAL HISTORY, &c.
Messrs. J. C. & S. STEVENS will SELL by AUCTION, at their Great Room, 38, King-street, Covent-garden, on THURSDAY, 24th of August, at 12 o'clock,

TO READING AND BOOK SOCIETIES, CLERGYMEN, AND FAMILIES THROUGHOUT ENGLAND, SCOTLAND, AND IRELAND.
New plan for obtaining all the New Publications and Standard Works for perusal without purchase.
Now ready, gratis, and post free,
HINTS for the FORMATION of READING SOCIETIES. The plan advocated in this little pamphlet will effect two important objects—that of adding to the supply of the current literature the choice of all the most valuable works in the various languages, and that of extending the choice of new books to the entire productions of the press. It is especially adapted to provincial readers, as by a small annual subscription the perusal of all the new works as they appear may be obtained:
Saunders & Otley, Publishers, Conduit-street.
Of whom may be had, gratis and post free,
A NEW LIST OF THE REDUNDANT COPIES OF NEW PUBLICATIONS in History, Biography, Memoirs, Travels, Novels, &c., withdrawn from Saunders & Otley's extensive Library, Conduit-street, Hanover-square.

14, Henrietta-street, Covent-garden.

LONDON: JOSEPH CUNDALL, 2, OLD BOND-STREET.

Second edition, price 4s. 6d.

THE PAPAL and HIERARCHICAL SYSTEMS COMPARED WITH THE RELIGION OF THE NEW TESTAMENT.

"A wonderful and horrible thing is committed in the land; the prophets prophesy falsely, and the priests bear rule by their means, and my people love to have it so; and what will ye do in the end thereof?"—*Gen.* v. 30-31.

"We have long wished to see some enlightened and gifted member of the society of Friends fairly attacking the Puseyite heresy; for we know that in this case an attack would be made, not on the details, but on the *principles*, of that insidious system. Our wish has now been realised, for this able work must be the production of either a *bona fide* member of that estimable body, or of a person holding their sentiments. It is able, argumentative, eloquent, and in most particulars *conclusive*. We cordially thank the author, whoever he may be, for so valuable an addition to our Christian literature, and hope that all denominations will benefit by his labours."—*Christian Examiner*, April, 1843.

"Peculiarly well-timed, and bearing throughout the impress of a truly Christian spirit."

"The author, whoever he may be, is an admirable writer. He seems not only to hold correct opinions, but possesses great facility in giving them forcible, lucid, and mild expressions; widely, too, as he may differ from others, his charity is unlimited for all—he is no sectarian in spirit."—*British Friend.*

"In contrasting the principal features which mark the views and practice of the Church of Rome with those which we believe to be inherent in pure Christianity, our author has produced an exceedingly able and eloquently written volume; which, whilst it unfolds, in glowing and vigorous language, the objectionable features of the hierarchical system, does not exhibit the least appearance of jealousy or of ill-will towards any denomination of Christians."—*British Friend of India Magazine*, June, 1843.

"At the present moment, when the Oxford controversy is assuming daily a more threatening aspect, such a work as this should be extensively read and recommended; and it will be found a valuable addition to every congregational library."—*Plymouth and Devonport Journal*, June 22, 1843.

Seventh Thousand of the Fourth Edition.

In 1 vol. price 3s. 6d., originally published in 2 vols. at 24s.

ESSAYS ON THE PRINCIPLES OF MORALITY, AND ON THE PRIVATE AND POLITICAL RIGHTS AND OBLIGATIONS OF MANKIND.

By JONATHAN DYMOND.

Price 1s.

ESSAY ON THE ACCORDANCY OF WAR WITH THE PRINCIPLES OF CHRISTIANITY.

By JONATHAN DYMOND.

"No one can hope to overthrow the reasoning of Dymond, without denying the truth of the book [the Bible] from which he deduces his arguments."

Second Edition, with Additions and Corrections, price 4s. 6d.

THE WATER CURE.

By E. S. ABDY, A.M.

Fellow of Jesus College, Cambridge, and Author of 'A Journal, &c. in the United States.'

Price 6d.

THE WATER CURE;

"Its Safety and Rationality."

By A. COURTNEY, Surgeon, R.N.

Eleventh Edition, enlarged, price 1s.

MERCY TO THE CHIEF OF SINNERS.

A Narrative.

By the Rev. W. BLOOD, A.M.

"We have read the above narrative with the greatest pleasure. Its style and object are of the same class with the well-known tract of the 'Dairyman's Daughter,' having the advantage of being more striking, and less diffuse; and thereby better calculated to win its way among those disinclined to read religious publications. While it rivets the attention, it pours into the mind a stream of sacred truth, drawn from the pure fountain of the Word of Life. While it illustrates, it corroborates by fact the testimony of the Holy Scriptures, and thus creates a thirst to possess and peruse that divinely-inspired volume."—*New York Observer.*

London: Charles Gilpin, 5, Bishopsgate-street Without.

FELIX SUMMERLY'S

RECREATION HAND-BOOK GUIDES,

Corrected for the Season of 1843.

"Recreation is a second creation, when weariness hath almost annihilated one's spirits. It is the breathing of the soul, which otherwise would be stifled with continual business.... As for those that will not take lawful pleasure, I am afraid they will take unlawful pleasure, and by lacing themselves too hard grow awry on one side."

FULLER'S HOLY AND PROFANE STATE.

Price 2s. 6d. in an Ornamental Cover of the 16th Century,

NATIONAL GALLERY,

WITH FIFTY REMINISCENCES OF THE MOST CELEBRATED PICTURES, DRAWN EXPRESSLY FROM THE ORIGINALS, BY MESSRS. JOHN JAMES AND WILLIAM LINNELL.

A few copies of this Edition, with each Engraving on a separate leaf, are printed in umber for colouring, price 10s. in a portfolio. To be had of the Publisher, and of Messrs. Paul & Dominic Colnaghi, Pall Mall East.

(Open daily, from Ten to Four, except Friday and Saturday.) Other Editions, price 6d., 3d., and 1d. Also,

Catalogue des Tableaux qui se trouvent dans la GALERIE NATIONALE. Prix 6d.

HAMPTON COURT PALACE.

(OPEN DAILY, EXCEPT FRIDAYS.)

Being a Guide to the Architecture, Tapestries, Paintings, Gardens and Grounds of Hampton Court: with numerous Embellishments on Wood, engraved by Ladies; and Plans of the Palace and Grounds from Official Surveys. The Illuminated Cover is taken from a design for a book-cover produced by Hans Holbein for Cardinal Wolsey. Second edition, price 1s. in cloth, and Holbein's cover in gold, with Maps and Plans; and 2s. 6d. not gilt, and with plan only.

"Decidedly the best popular guide to the picturesque beauties of Hampton Court of any extant."—*Spectator.*

FREE PICTURE GALLERIES;

Being a GUIDE to all the PICTURES in the NATIONAL GALLERY, the DULWICH GALLERY, the SOANE MUSEUM, the SOCIETY of ARTS, and the BRITISH MUSEUM. Price 1s. 6d.

"These Catalogues are more raisonnés and correct than the correspondent official ones; are more portable, and to their limits every way commodious, whilst they cost together much less than several of the latter cost separate."—*Athenæum.*

HOLIDAYS; a Guide to London Sights. 6d.

WESTMINSTER ABBEY.

(The Abbey opens at 9 A.M., and closes, in the Summer, at 6 P.M. The Tombs are shown until half-an-hour before, and about an hour after, Divine Service, which commences at 10 A.M. and 3 P.M. Entrance to Poets' Corner, free; to the Nave, alone, 2d.; with the Chapels, 6d.)

A Guide to the Architecture, Sculptures, Tombs, and Decorations, with 56 Embellishments on Wood, engraved by Ladies. 4 Etchings, a Specimen of Encaustic Tiles in the Chapter House, and an Illumination. Price 7s. Cheaper Editions, 3s., 1s. 6d.

"Its pages are not disfigured by the usual Guide-book sentimentality, rambling on without method, and mixing inaccurate if not false information with indiscriminate and nauseating praise, but it gives a well arranged and correct description, neither too popular nor too pedantic, of the Sacred Edifice."—*Ecclesiologist*, published by the Cambridge Camden Society.

"A volume got up in excellent taste, and written in a right spirit; critical so far as criticism could be allowed, but always suggestive, and testing opinions by reference to principles. As if to perfect the interest of the work, its fifty-six illustrative engravings have all been executed by women; and some amateurs, Lady Callcott and Lady Palgrave, amongst others, have gracefully contributed drawings, and thus associated their names with their sister artists."—*Athenæum.*

GUIDE A L'ABBAYE DE WESTMINSTER. Prix 1sh.

TEMPLE CHURCH.

With Eight Illustrations. Printed in three colours, in novel combinations of lithography and type, with Ornamental Cover of the pattern of the Encaustic Tiles. Second Edition. Price 1s.

LONDON, SATURDAY, AUGUST 19, 1843.

REVIEWS

The Discourses of Sir Joshua Reynolds. Illustrated by Explanatory Notes and Plates, by John Burnet, F.R.S. 4to. Carpenter.

When reviewing the last edition of Reynolds's literary works, we suggested the publication of yet another one. And this we did, because that edition, like all its fore-runners, was published on the bald plan of giving the text alone, as if an attempt to enlighten the reader by note or comment were equally profane in Fine Art and in religion. We added, "Let us not be misunderstood; we recommend no tampering with the text of Reynolds, unless correction of its manifest errors come under that head; no taking its form as a lay-figure whereupon to hang splendid rags of declamation; but we recommend—demand—from any one who sets up for a patent editor to supply its deficiencies" (*Athen.* No. 435). Whether our challenge called forth Mr. Burnet's new edition of the Discourses, we cannot well guess; because, though he has hung neither splendid rag nor robe of declamation upon the naked subject, he has omitted to furnish it out with many of those articles we specified as *desiderata*—while certain other articles which he has troubled himself to provide for it, we should have deprecated as cumbersome or unsuitable. It is true, his task was difficult, and dangerous to boot. Luckless Daniele di Volterra got the immortal nickname *Bracchetone* by apparelling in clumsy small-clothes the un-sheeted dead of Michael Angelo's 'Last Judgment.' It might have been wiser to let Reynolds's skeleton outlines stand before the public in all their bareness and meagreness, than to run the risk of acquiring another such unsavoury appellation. Still Mr. Burnet has done somewhat. Let him state his own claims:—"I am the first who has written notes upon Reynolds, and that in an interval of nearly fifty years. * * In trying to make his excellencies more apparent and useful, I have, at the same time, endeavoured to make what I conceived his errors more evident also, that they might be considered before being adopted. I have had many opportunities of hearing the opinions of the most eminent artists since his time, and have examined carefully the most eminent works of the various schools; I therefore feel a certain confidence in explaining these Discourses to the younger students; at the same time advising them, in the words of Lord Bacon, to 'read, not to contradict and confute, not to believe and take for granted, nor to find talk and discourse, but to weigh and consider.'"

How singular that half a century should elapse without one note being written on the artistic Manual best deserving and most requiring illustration among all similar treatises extant! Yet not singular, when we bethink ourselves that English art has retrograded, rather than advanced, through the said period. Whom have we had since equal as a portrait, landscape, dramatic, or epic painter, to Reynolds, Wilson, Gainsborough, Hogarth, and Barry? It were indeed a miracle, if, while the practice of art was day by day taking a lower and pettier character, its theoretical principles had become more exalted and enlarged—if Reynolds's volume, which advocated the solid and the grand alone—which anathematized the superficial, however attractive, and the insignificant, however tasteful, had been honoured with, not the notes of an F.R.S., but even with his notice. Does Art then begin to rear her awful head anew, that we find the Discourses at length obtain this compliment? or is it the epidemic spirit of criticism distinguishing our age (as we have elsewhere observed)—the mania for "illustrations," pictorial and scriptorial, of every sort of every possible subject—that has made Sir Joshua's text a pretence on which to vent itself? We must leave the decision *sub judice;* like Moses Primrose, we, in the plenitude of our simplicity, deem the comprehensive tenet, "whatsoever is, is," the safest admission also.

Mr. Burnet's model of an editor differs much from ours. "I feel confident that many more will be induced to follow my example, as the excellence of their groundwork [Sir Joshua's Lectures] will support the embellishments of many illustrators, who, though they may add little to the sterling merit of the performance, yet, like a fresh coat of varnish, may bring out his beauties into a stronger light." If Mr. Burnet seriously and consideratively proposes this as the proper office of an editor—*embellishing* Reynolds's groundwork, and bringing out his *beauties*—we can by no means coincide with him; and if he at all imagines himself to have set an "example" of any such *varnishing*, we cannot flatter him that he has even approached the goal of his sublime ambition. One very good reason we might give; *videlicet*, Reynolds has no "beauties" to bring out. Unless the word were caoutchouc, tenterhooks strained by windlasses could not stretch it to include Sir Joshua's real merits, which are quite of the plain, prosaic cast. Sound principles make up his staple excellence. Some of his professional maxims have the wide-minded wisdom and weightiness which qualify them for general proverbs. But however this may be, our notion is, that an editor's function involves somewhat higher ends than hanging flowery festoons upon the rough granite statue of Art which Reynolds blocked out, or applying cosmetics to improve its weather-beaten complexion. 'Tis just as difficult, let us reflect, to wash the sallow man white, as the blackamoor. And even though you bedizened his every member and feature till he resembled an Indian idol, all rings and bracelets and necklaces, were it not a worthier, besides a far more profitable work, to develope his latent powers than to make him a prettier fellow? This, we say again—to enlarge the ground-plan of Reynolds's work, to elevate the superstructure; in other terms, to broaden and heighten (for they can scarce be laid deeper) the principles of criticism it comprises, as Sir Joshua himself would do if he now, with all his heavenly intelligence about him, became his own editor—this is the grand object a commentator must have before him, unless instead of a beautiful temple to Art, he fixes his eye on a little pile of gold, at the end of the vista. Except something in that way be done, an appender of notes might as well premise, with Balthazar the musician,—

> Note this before my notes;
> There's not a note of mine that's worth the noting.

Artistic criticism has, since Reynolds's time, made large strides, onwards and upwards; though some of its strides may be of an opposite kind—backwards and downwards; there are such counter-marches of knowledge! We do not find the English grammar of Art has kept pace with the Continental. Mr. Burnet, indeed, tells us that the former has stood where it was fifty years ago; but he omits to tell us it stands even now, after his advancement of it, like a transplanted milestone, little removed from the old spot. Such is the progress of public intelligence on this route! Though we accord him all the credit justly claimable for having begun the beginning of an elucidative system long wanted, yet we do not think his few notes increase the sum of critical knowledge so materially as to take a high rank among the *Augmenta Scientiarum.* Reynolds's "globe of precepts" has been swelled by certain grains of learned dust, scattered over the outside, which bear a proportion to it like what the sands of earth bear to its solid sphere; if, indeed, we can call learned, upon Fine Art, the dust shaken from Dr. Johnson's peruke, or swept from the shelves of Dr. Goldsmith—our editor's favourite authorities. What volumes it speaks—folio volumes—elephant-folio volumes—for the state of "æsthetics" among our countrymen, that the chief oracles whom an English critical writer quotes upon this subject are those two irrefragable doctors, and easy-going Mr. Addison!—that the Sibylline leaves he consults are those of the 'Rambler,' 'Spectator,' and 'Looker-on!' What a broad butt does Britannia expose to the shafts of European ridicule, when she pronounces these her great luminaries and legislators, her last appeals in the philosophy of *connoissance!* He, forsooth, that stout-minded, narrow-minded, weak wise man, Samuel Johnson—he, forsooth, one of the Caryatides to support the British Temple of Art! Why, he is not fit—rather he is fit—to make part of its concrete, its filling-in stuff. Surely *latrator Anubis* has had his day and his "bow-wow way" long enough. Surely we might exclaim, with Garrick of another dogmatist,—

> Thou great infallible, forbear to roar,
> Thy bulls and errors are revered no more!

Why, he is not even a safe opinion on ethics, wherein the so-called "moralist" plays fast and loose, like a literary Swiss, lured by his own vanity to fight—now for, now against, the cause of Truth. Hudibras anticipates him—

> He could on either side dispute,
> Confute, change hands, and still confute!

Nay, on the subject of Poetic Literature we imagined his dicta passed at present as secular gospel with country gentlemen alone, like Burn's Justice as part of the Pandects! In the Heliconian fount he is a very *otter*, who fuddles the element, and kills the fish. We struck a balance, equitable, as it appeared to us, (*Athen.* No. 441) between his real merits and deficiencies, but whether so or not, we conceived there could hardly be a second opinion about his total incompetence to write anything upon the fine arts, unless certain verbose generalities and Garagantuan commonplaces; or to take any views about them beyond the most short, and dim, and oblique-sighted, when a whirlwind puff was wanted by his friends for awakening the people, or an occasion by himself to gain the great end of his existence—silencing a dinner-table! Not that we should object were the colossal lexicographer brought forward now and then as buttress or bolster to a weakly-stated opinion—

> He was a man of stature bigge,
> And bigge withal in minde—

big, without much breadth, like a Roman aqueduct; much less should we proscribe Addison, who was a tasteful dilettante, if no profound connoisseur. But that such names only should be cited augurs ill for the Annotator's acquaintanceship with veritable authorities, and with the progress which artistic criticism has made of latter years throughout Europe. Is it not still worse than a lecturer holding up as prime authorities on the art poetical—Dr. *Hugh Blair* and my lord *Kaimes?* Would any one, save an octogenarian critic from the Orkneys, quote long passages out of their lucubrations, as infallible decrees, when they are at best but examples suitable to an 'Elements of Elocution, for the use of Schools'? Verily, no editor save one who had lived the life of Selkirk in Juan Fernandez ever since Johnsonian times, with a library composed

Digitized by Google

of a torn Rasselas and an odd volume of the Tatler, could have kept his good old artistic creed more uncontaminated than Mr. Burnet has his, by the new lights of French and German criticism. But perhaps he enchants his readers with the subject by the charms of his style, and lures them on, like the warbling bird in the Arabian tale, over many a barren district? Fine-art critics should, we think, have this merit at least, unless they have some other one much better,—depth, erudition, originality—which may compensate for its absence. Not to "bring out the beauties" of our author's syntax, by quoting particular examples, we must declare the general character of his annotations didactic even to the brink of dulness; they want that terse diction and dense construction which give the Discourses themselves their impressive sterling air, and which appear still more indispensable where poetic and impassioned spirit are still more deficient. Nevertheless we grant the homeliest style far worthier than the embellishing or beautifying style recommended: leave that to the literary fringe and gold-lace manufacturers! There is indeed a kind of decoration that would do a good deal, though scarce enough, for Reynolds's work—decoration very different from what Editors of Annuals, and Bookbinders, and Steel-engravers, will understand by the word—but very much what *Greek architects* perhaps would translate it, viz., a kind of decoration not adopted for decoration's sake alone—a kind in which the decorative parts were also constructive, *i. e.* in which the ornamental additions were also useful—in which beauty did duty—in which may be observed the reigning principle at least, if not the iron rule, that every detail, like every mass, was proportionably material to the Temple. Should Mr. Burnet have decoration such as we suggest, in his eye, he has only given it an ominous name. Beyond doubt the Discourses need a commentator whose splendid glow and flow of eloquence, inspired by a sane enthusiasm, might attract the reader whom Sir Joshua's cold and costive language repels. Spirituality of manner, rich-mindedness to furnish varied illustration, imaginative and combinative power to apply it, fervour from which even frigid souls might catch fire, reasoning at once logical and poetical, now direct, now irregular, to insure convincement, if not in floods of light, in flashes—such are a few of the *desiderata et desideranda* for notes and commentaries upon these Lectures. We do not require a style of rhetoric that, as Bachelor Sampson Carrasco says, would "pull the soul up by the roots;" we deprecate King Cambyses' vein; but above all defend us from embellishers—your literary *Luca Fa-prestos*, who toss off volumes as they would pancakes—your fine writers, whose flowers of speech are more killing to the sense than flowers of arsenic to the vital principle—defend Reynolds's Lectures from such beautifiers as these; the most humdrum editor is far preferable.

Mr. Burnet, we repeat, has the merit of having seen, whether through our glasses or his own it matters little, that the English Grammar of Art, albeit well-grounded, was imperfect; moreover of having commenced an illustrative supplement thereto. He must not suppose we forget that fact in our strictures upon his performance; our earnestness for the cause of Art may render us severe and exacting, but makes us also reiterate his praises, even though the peal be incapable of much change. He will no doubt have originated the right editor, if he is none such himself. Let us, therefore, push our examen a few steps farther, and reckon on his magnanimous consent to be "cut up" when the interests of Art demand it. Why should we feel more scrupulous than cloud-compelling Jove, who took all the sacrificial contributions he could get from the offerer, yet thundered against him in return?—

> The oblation indeed he accepted, but promised him *woes without measure*,

because driven thereto by that inexorable dame, Necessity!

The first point for which we must call our annotator over the fiery coals of criticism, is that he does not dwell with sufficient emphasis nor at sufficient length on the subject of *draughtsmanship*—he does not dwell at all, he barely touches on it. We should have expected this, the cornerstone of high aspiring Art, or rather the foundation-rock of enduring support to its temple, albeit most English builders prefer a sandy basis—we should have expected this to find a very prominent, a principal place, in an enlarged and amended edition of the Discourses. We had, as guarantee that this expectation would be fulfilled, the name of a time-honoured professional editor. Verily we should have expected no such thing!—Neither did we expect it—and the professional name was, with us, a guarantee for the reverse of such an improvement—and the more time-honoured the editor the less we hoped from his veteran practice. Why? Why because it is impossible, improbable at least, that the beaten road of English Art will be deserted by the old roadsters, and that draughtsmanship will now be preached up as needful to perfection, by our R.A.'s and F.R.S.'s, when they have done very comfortably all their lives without it. In sober seriousness we have a due esteem for the talents of our Royal Academicians: no journalists paid so earnest and elaborate a tribute of criticism last year to the genius of a painter whose draughtsmanship evinced little craftsmanship enough—*Wilkie*: but we must acknowledge our opinion, that if British Art is to enter upon the loftiest walk—along which Design alone can lead it—those who never much studied design, who were bred up in the belief of its minor importance—can scarce prove even good direction-posts upon a route far above their ambition. As founders of the New Temple, the hypothetical School of Reformed British Art, we have slight hopes from the grandees, or the greybeards, be they Academicians or not, of the profession: little from their encouragement, still less from their instruction, nothing from their example. True, they may now and then, like Mr. Burnet, recommend "drawing," somewhat as a sage grave citizen, all unlearned himself, tells a schoolboy to "mind his *Latin*," or enjoins an apprentice "honesty *of course*," after numberless more efficient receipts how to make his fortune. Draughtsmanship may indeed be called the honesty of the art, not because it is oftener praised than practised,—not because its temporal policy is rather dubitable amongst a trading people,—but because there is no soundness at the core without it. Our hope, our faith, rests on the rising generation of painters, which we trust will approve itself, in the better sense of the equivoque, a rising one, and beware lest when it thinks to climb it should fall. There are steps down into the Bathos as well as up towards the Sublime. This perhaps we might pronounce certain, the present, or rather the preter-imperfect generation of painters, *must* fall unless it rises—it cannot keep the previous level. Neither can it, we opine, reach the old level which Reynolds and his contemporaries gained, by the old way—colour. Let it paint the new Parliament Houses with goldenest ochres, and reds richer than rubies ground in rosewater, and blues sweeter than Venus's eyes, the meretricious spirit of the age will never make such frescoes as can rival the sober gorgeousness of Sir Joshua's oil-pictures, at least, till we learn to draw far better. But will Presidents, Superintendents, R.A., and A.R.A. sit down again in their own Life and Model schoolrooms for this purpose? They could as easily put off their grey locks and become whiteheaded boys again! *If*, we suggest once more, (out upon that sceptical conjunction!) if British Art be destined to produce anything higher than the best portraits, the best cottage-scenes, the brightest pictorial bijoux, and prettiest little cabinet pieces in the world—bits of effect, bits of nature, bits (*tit-bits*) of colour—draughtsmanship affords the single means whereby such a consummation shall become attainable, and youthful England the sole hope of its attainment. Junior artists only are flexible enough of hand and of *mind*, for learning that means, and wishing to learn it; they only will yield to the impulse which Art now feels over all Europe.* Some exceptions do not subvert our general principle. The hope, however, above mentioned becomes, we confess, like Marc Antony's angel, "a fear" in presence of the Evil Genius that seems Great Britain's most remarkable genius now flourishing—materialism, under the grandiloquent misnomer, utilitarianism. At best, we are aware, Parnassus top is no table-land; it consists of certain peaks or points (perhaps the Epic and Dramatic, and a third the Lyric, somewhat lower), whereon very few mortals can obtain permanent footing. If any one English poet-painter, with draughtsmanship or without, can scale any one of these summits, he will top the extremity of our expectation also. Meantime, we have nothing better to recommend to those who would work an advantageous change in national art, than Durandarte's receipt—"Patience, and *shuffle the cards!*"

* Towards its progress in England much may be contributed under these particular circumstances, by those gentlemen who direct what are called *Preparative Drawing-Schools*, seeing that its stationariness, if not retrogradation, so far as dependent upon draughtsmanship, will find aiders and abettors enough among those other gentlemen who direct what is called the Principal Drawing-School at Trafalgar Square. We wish the first-mentioned teachers would understand their position, and observe how they could elevate it, along with the character of National Art. There exist, we believe, many such preparative schools about town, but the most heard of are Mr. Sarsfield's Taylor's "Living Model Academy," and a still more celebrated one, named "Sass's School of Art," from its establisher and late proprietor. This school has now come into the hands of Messrs. F. S. Cary and Redgrave, both artists, the latter well-known, the former best distinguished as the son of our English Dante. If taste be at all heritable, or pure critical feeling and judgment at all communicable, we may expect much from so near a relative of the poet and pre-eminent Translator as Mr. F. S. Cary, who is chief conductor of the school. Such qualities have, or ought to have, wider jurisdiction in every system of education than pupils, or their parents and guardians still more thoughtless, nay even than teachers themselves, imagine; especially in the Fine Arts, which, unless imbued with poetic principles, descend to the rank of arts altogether mechanical, and of the most frivolous, too, and superfluous among them. To enlighten and enlarge the learner's mind upon the true scope of Painting, the grand purposes it may fulfil, the exalted objects it may accomplish, directing, however, his efforts towards such purposes and objects as his powers *can* attain—to chasten his imagination (if he has any), to inculcate the need and show him the use, of poetical literature (if he has a poetical sense)—all this, besides much we cannot particularise here, is within the province of a teacher, is his highest, though his least irksome duty, as he may achieve it during almost imperceptible moments while the mere practical routine of his office proceeds, while he tells his pupil how to draw a feature or colour a robe. We seldom make large advances of encomium to any one, but hope in a short time Messrs. Cary and Redgrave will have a claim upon us, which we shall discharge with interest. Though Mr. Redgrave's range of art is not high, it evinces careful drawing, and a power over expression free from caricature, from caricature of *pathos* no less than of humour, from that hatefullest taint which contaminates English works of sentiment—sentimentality. Being still but an A.R.A., we reckon him and his coadjutor among Junior Artists, and therefore trust they are not men after the old fashion to undervalue draughtsmanship, as the great means of approaching great ends, nor to pronounce supercilious opinions against its ablest, however defective, cultivators at present—German and French professors. They would thus raise their pupils like themselves, above the narrow-minded nationality that disparages everything foreign, a prejudice no less condemnable than its opposite extreme, the renegado disposition to run down everything English.

The Bampton Lectures for 1842. By the Rev. J. Garbett, M.A., Professor of Poetry in the University of Oxford. Oxford, Slater; London, Hatchard.

Anglo-Catholicism not Apostolical. By W. L. Alexander, Esq. Edinburgh, Black & Co.

Professor Garbett has in these lectures taken the field against the Tractarians, and assailed their favourite tenets with more zeal than is usually exhibited in university pulpits on questions which divide the Church. At the same time he deprecates recourse to any tribunal which would have authority to decide the questions in issue between the Tractarians and their opponents, declaring that a convocation assembled to examine how far the directions of the Rubric are obligatory, and what amendments are desirable in the Church of England Prayer-book, would, in all human probability, lead to such a schism as that which has just divided the Scottish Kirk. If his view be correct, the Church is in just such a condition as the State would be if all legislative and judicial functions were suspended, and the administration left to be carried on by sheriffs, municipalities, and parish constables. The Professor thinks that under present circumstances it is desirable that the Church should continue in this state of provisional existence, and that its claims to self-government should be permitted to remain in abeyance, until a season arrives more convenient for examining how far these claims are consistent with the demands of the State, the privileges asserted by individuals, or the general feelings of the nation. It is very clear, that his own work must tend greatly to aggravate the difficulties of such an adjournment:—when it is stated by a divine of high reputation, from the university pulpit, that a system advocated by a large, influential, and increasing body of his brethren is "pre-eminently dangerous in these vital points, *justification by faith only, and the sole authority of Scripture;*"—that in these points the system is marked by "its manifest unscripturality and its complete divergence from the Church of England;"—and when, on the other hand, the Tractarians assert that the evangelical clergy teach modern heresies, at variance with the doctrines of the primitive Christian Church, it is evident that the necessity for an appellate jurisdiction must be felt every day more and more, and that if the clerical body refuses to pronounce a decision, the duty will be forced on the State or the Parliament.

The questions in issue are of too grave a nature to be profitably discussed in reviews or periodicals; and therefore, notwithstanding the multitude of volumes, tracts, and pamphlets sent to us upon the subject, we have studiously avoided entering into the Puseyite controversy, though we have not been incurious or uninterested spectators of its course and progress. We still adhere to our neutrality, because ours is not the tribunal for determining matters which affect the vitality of an establishment. We may, indeed, regard every author who sends a work on either side, as making some kind of appeal to our judgment, and, in justice to such, we are bound to assign our reasons for declining the jurisdiction. The questions in issue are two, one of which is to be decided by whatever body is the depository of the supreme government of the Church, and the other is to be determined only by the imperial government of the nation. The ecclesiastical question is, Does a large section of the clergy teach doctrines inconsistent with the principles on which the Anglican Church is based,—or is either Popery or Puritanism, against both of which that Church has protested, covertly insinuated instead of the true Anglican doctrine? If the Anglican Church has a real, social, and individual existence, it has a right to pronounce an authoritative decision on this matter, and with the question in this form no other men, or body of men, have a right to meddle. Like every civil society, the Church has an inherent right to declare what is, or is not, inconsistent with its own institution; the State would only have a right to interfere if the appellative or legislative body of the Church set up a standard different from that which it presented to the State when it was accepted as an establishment. Should the Church, however, acting as a body, decline this appellate jurisdiction, it would be a confession that it had not an individual, but merely a parliamentary, existence; and Parliament, being thus proclaimed the supreme gubernatorial power, would be bound to examine the allegations of "unscripturality and divergence," either directly by legislative interference, or mediately by erecting some new tribunal.

But while this question presses on the Church, another, of not less moment, is forced on the attention of the State; namely, whether the endowed clerical body fulfils the conditions for which it received from the State the boon of legal establishment. The aid of the law, in collecting its revenues, was not granted to assist its members in promulgating unscriptural doctrines, or tenets which diverge from the Church of England. We lay aside all question of the divine or human origin of ecclesiastical dues; we set the powers of the State, in the alliance between it and the Church, as low as either Hildebrand or Laud, and limit them merely to affording legal aid for collecting ecclesiastical revenues; but this does not weaken the pressing importance of the question,—ought aid to be given for the collection of funds which are to be devoted to the promulgation of error?

Into the truth or falsehood of this allegation, it is not our business to inquire: it is quite sufficient to state, that the allegation meets us in every direction; bishops have made it the subject of charges; heads of colleges have issued solemn warnings; grave professors have uttered denunciations from the pulpit; tracts and pamphlets without number have issued from the press; and no one has as yet determined how the question is to be decided. We do not believe that this state of things can continue; we are certain that it ought not: at the very moment that claims of submission to the teaching of the Church are most imperatively urged, we are informed, on the highest authority, that the Church is completely divided respecting what it ought or ought not to teach. One party is accused of forsaking Protestantism, and another of abandoning Catholicity; they bandy harsh accusations and bitter reproaches against each other, after which they tell the laity that it is their duty to submit to both. Matters cannot safely be permitted to remain in such a state; it is impossible, at present, to determine into what form the practical teaching of the Church may consolidate itself, when the present divisions have passed away; the elements of dissension, once spread abroad, must run their course, unless some power be interposed to prevent the threatened disruption.

Mr. Alexander's volume is purely controversial, but it is written in a calm, considerate spirit, and states the arguments of opponents with fairness and candour.

Lucretia—[*Lucrèce*, &c.] *a Tragedy in five Acts.* By M. Ponsard. Paris, 1843.

THE so-called romantic school of literature seemed, but a few years since, destined to make an entire conquest of France. Nearly all the younger poets, with Hugo in the van, professed its doctrines and laboured to enforce them by practice. Even the Théâtre Français, the Palladium of the classical drama, was at last compelled to admit the march of innovation; and is now painfully bearing the extremity of change in the infliction of 'Les Burgraves.' Of taste, however, signs of reaction have not been wanting; and the triumphs of Rachel in Hermione and Andromaque, were not solely due to the wonderful talent of the young actress. The tragedy of Corneille and Racine still counts a vast number of sincere admirers, stunned but not converted by the temporary success of productions which they condemn as absurd and barbarous. One half at least of the educated Frenchmen, above the age of thirty, belong, we believe, to this number; and are attached by sympathy or traditional respect to the older school. With all our devotion to the true genius of romantic poetry, we can see many reasons to account for this preference on the part of our neighbours. The performances of the French *romanticists*, taken as a class, have hitherto displayed more of wilful licence, than of the genial excursions of real poetical freedom. In their latter attempts, especially, little can be discovered but an impotent straining after novelty, and trite or feeble corruptions paraded in extravagant undress. At present, after a trial of barely fifteen years, their forces seem already exhausted; while in the drama, at least, little has yet been done to attest the presence of a genuine vocation on the part of these eager modern iconoclasts. They have given France no drama capable of replacing the old models; which, however unnatural and constrained, were at least perfect in their artificial kind, and are probably more consistent in reality with the character of the national genius than any other that French invention is likely to create. It is therefore with some reason that the admirers of the unities in rhyme denounced the new school as the diseased growth of a period of change; and have long been looking wistfully for a restoration of the monarchy of taste, which, according to their belief, dates its commencement in the age of Louis XIV.

To this disposition, we think, must be ascribed the enthusiasm which greeted the appearance of the 'Lucrèce' of M. Ponsard—(see *ante*, p. 392) a young and unknown author, who brought from the remote department of the Isère, and threw upon the neglected stage of the Odéon, this tragedy, coined upon the classical model, and, although in some respects deviating from its strictest forms, as sententious and as declamatory on the whole, and (if we must confess it,) as wearisome as any 'Agésilas' or 'Rhadamiste' of the *grand siècle*. Its success was sudden and universal; and however surprising it may appear to us, we feel bound to bestow some attention on a work, which all Paris ran to applaud; and which has been pronounced, by eminent French critics, worthy to belong to the school of 'Britannicus' and 'Mahomet.'

After diligently reading the play, and painfully witnessing its representation, we have been unable, by either process, to discover in it any vivid dramatic effect, the least skill in the developement of the catastrophe, or even such a prevailing interest in the part of Lucretia as the title seems to promise. The story which Livy has immortalized could not, indeed, be acted on any—much less, of course, on the French classical stage; and in this instance it is in reality little more than the framework of a picture; the chief points of which are the patriotism, concealed under assumed idiotcy, of Brutus, and the lascivious insolence of Sextus Tarquin, provoking, by Lucretia's wrong, the explosion which delivered Rome from her tyrants. To these the author has added, from his own invention, the jealousy of Tullia, the wife of Brutus, whom Tarquin has seduced and forsaken on becoming enamoured of Lucretia; and the

Digitized by Google

most effective part of the tragedy is furnished by the conflict between her despair and his contempt. The part of Lucretia is throughout insupportably tame; her appearance at the close of the story excites but a temporary interest, which is at once diverted to the fulfilment of Brutus's political design; while the punishment reserved for the author of her death is left to be conjectured by the spectator. The incidents are loosely connected, and the celebrated unities of time and place so little observed, that nothing need absolutely prevent the reader from supposing that Rome and Collatia were leagues apart; or that years had elapsed between the excursion from the camp before Ardea, and the consummation of the guilt of Sextus. As we cannot suppose these defects can have been overlooked by M. Ponsard's admirers, it must be concluded that he owes his success to the declamatory rather than to the dramatic features of his work: its merit, indeed, as far as we have heard it proclaimed, is exclusively referred to the long *tirades* with which the scenes are filled. In these we admit the presence of a certain masculine turn of thought and expression; and can admire in many places the eloquence and force of the verses; but they are unequal, and often descend to the level of absolute vulgarity, which however offends us less than the false and violent metaphors, exceeding the ordinary pretension of French bombast, that betray M. Ponsard's efforts to be sublime on great occasions. The work, on the whole, to our foreign eyes, discovers in every respect the youth of the author; and we cannot but think that it owes much of its good fortune to the tendencies which have already been described, rather than to its absolute poetical merit.

The first act, which passes at Collatia, describes the surprise of Lucretia, amidst her domestic toils, by the warriors from the camp at Ardea, and the sudden kindling of Sextus Tarquin's impure desire. Brutus, who attends Sextus, as a kind of make-sport, is detained, after the others have retired, and questioned by Lucretia, who has divined his real character and purpose, which he at last confesses.—The companions of Collatinus are feasted after they have witnessed and honoured the triumph of Lucretia's domestic virtues. In the second act, we are at Rome, listening to the soliloquy which further reveals the design of Brutus;—the following is a part of it:—

She judged aright: yes! clouds are gathering round;
Be but occasion given, the leader found,
Our nobles, yet not all by kings depressed,
Shall wake to claim their rights, and rise redressed:
The man am I!—be mine the praise alone
T'avenge my country's wrongs, my sire's! my own!
Chastise the past, enfranchise coming days,
And make my name of Brute a name of praise.
Then wait! not yet the hours have reached their bourne;
The people rage not yet,—they only yearn
In troubled calm, like the dread pause that broods
Before the anger of the whirling clouds.
'Tis from the kindling blast Heaven's threatenings leap,
Till then, dread thunders, on my anvil sleep!
Thou pure ancestral blood, my throat that strains,
Descend, indignant, through these idiot's veins!
And thou, my Rome! so oft invoked, so dear!
Thou Rome, for whom I plan a bright career,
And promise glory, be the chance but mine,
And power, thy kings ne'er dared but dream to win,
Rome! when required, to thy auspicious reign
Each drop of blood my sires bequeathed I'll drain;
Meanwhile I offer patience—still abased.—
Take this libation of the scorn I taste!

After this, Brutus, in a long political dialogue with his faithful agent Valerius, discusses the constitution to be given to the Republic, and explains the necessity of waiting for some flagrant provocation before appealing to the people. Sextus Tarquin then appears, with Tullia, from whom he barely pretends to conceal the design against Lucretia, and whom he leaves contemptuously with Brutus. For a moment the latter casts off the mask of idiotcy, and sternly reproaches his wife with her guilt and shame: she flies, covered with distress, and alarmed by the sudden change in the language of Brutus, which she regards as ominous and supernatural. Act 3, still at Rome, acquaints us with the project of Sextus Tarquin, which he confides to his creature Sulpicius. As he is about to depart for Collatia, Tullia suddenly makes her appearance. The dialogue which ensues, being perhaps the finest part of the drama, we shall attempt to translate, in spite of its length:—

Tullia. Sextus!
Sextus. You, Tullia! here?
Tull. Yes, Sextus! you
Must hear me claim one final interview;
I fain would learn my future; would be told
What place, henceforth, in your regard I hold:
If still I please you, or if nought remains
But humble patience and unpitied pains,—
In short, what mean you?
Sext. If you ask my thought,
I deem it wilful, Tullia, thus unsought
To come. Consider how so bold a course
May make your honour food for light discourse,
And wound your name.
Tull. O let it rest,—my name?
Need you regard, when I forget its shame?
Time was, your heart less cautious fears had shown,
And now you seek it, knowing well 'tis flown.
Reply! and leaving poor deceits, avow
What was my heart to yours—what is it now?
Speak! a vile action double-dyes his shame
Who dares the act, yet dares not face the blame.
If ne'er you loved, if all you vowed was jest,
Be man enough to own the crime, at least.
Be bravely false, stab in the victim's sight,
And not like coward thieves who skulk in night.
Say then!—
Sext. With all my heart! at your behest
I'll bare the inmost feelings of my breast.
I ne'er assumed the virtue harsh and stern
Our history worships in old Numa's urn;
The charm of empire, born to mount a throne,
I felt;—but loved not for itself alone.
Nor wealth I prize, nor covet power, in truth,
Unless to bind them to the car of Youth,
And, onward by these tameless coursers whirled,
Speed through the raptures that embrace my world.
I pluck each joy I meet, or where it breathes
In shade of ivy leaves, whose cooling wreaths,
Taming the rich Cæcubian's fragrance warm,
Arrest its spell, and Bacchus long disarm;
Or where, unzoned, light Venus from above
Sheds rapture in the lap of sportful Love.
I worship pleasure: while you charmed my soul,
It yielded freely to the sweet control;
But never dreamed,—or else my memory lies,—
That Love should join our lives in endless ties;—
I pictured Love, not veiled in tristful gloom,
But joyous, smiling still, and crowned with bloom,
Free from the nails of brass and heavy chains,
Whose hate remorseless Nemesis constrains;
And led by fancies, ever young and bright,
Proud of the past, and keen for new delight.
Even you, the bondage of your early state
Must teach, methought, all second bonds to hate;
And marriage-sick, your heart could never mean
To grow a vassal, as your hand had been.—
I thought so, Tullia; and conjecture grew
To proof, in every outward sign in you.
You never wore the dark and troubled air
That speaks a soul devoured by secret care;
You were not found retired from crowds apart,
To hide the tumult of a throbbing heart;
But glancing o'er your guests, with easy mien,
The ceaseless laughter of an eye serene;
Soul of each feast, with smiles that ever beamed
O'er the gay festivals, whose queen you seemed.
Ev'n yesterday, when jest and song went round,
And waked your echoes with their well-known sound,
Who would have thought——
Tull. And tell me, false one! why,
But at thy bidding? Darest thou say 'twas I
That bid the night our banquets oft prolong?
For whom the noise, the incense, and the song?
Say, were they sought for me? I loathed them all!
Thine was the work!—to thee I owe my fall,
For listening but too fondly! But for thee
I might have known the peace of moments free,
And felt what pleasures calm seclusion gives,
And what content in humble station lives.
O peace destroyed! O quiet lost to me!
Who stole them from my heart?—say, was't not he?
Yes, thou! My weakness leading towards thy aim,
Through soft indulgence, down to vice and shame;
Thy false advice prepared thy will its way,
While Lust at Duty's door in ambush lay;
And, fearing simpler joys might keep me chaste,
Thou sought'st my ruin from a pampered taste.
'Twas at thy wish, by noise and show outfaced,
That Labour, guard of Modesty, was chased.
And wouldst thou falsely say this blame was mine?
Go! I have read thy heart's concealed design,
The long-sought pretext, told in looks that were
Full of the insult that to-day I bear!
So, after risking all to please him,—aye,
Ev'n till my shame alarms an idiot's eye,
And makes the senseless blush, by him made vile,—
He dares to turn, and mock me with his smile!
And while intent I listen, coolly prove
He meant mere pastime when he sought my love.
Shame brand you, Sextus, and your brutal tongue!
Base is this insult, on a woman flung,
To whom from you, of all, respect was due
In payment for the name she lost by you!
One word—I cease to urge you, or entreat:
My pride revolts from crouching at the feet
Of your contempt. The accents you disdain
You hear no more;—but we shall meet again!
And when I die, before the shades I seek,
I'll snatch my anger, while my ashes reek,
From midst the pile, and bear it thence away,
As flies the tiger to devour his prey.
I'll cross the Styx, my vengeance fostering still,
To make all Hell accomplice of my will;
And when misfortune hovers o'er your head,
That day your paleness shall expect my shade!

The reader is entreated to believe that the passages marked in italics, which might be supposed stolen from some of the rants of Nat. Lee, are really M. Ponsard's, and are, at least, not exaggerated in the translation. The appearance of the Cumæan Sibyl, whose offers are scornfully rejected by Sextus, and who gives the last of her treasures to Brutus, hailing him "First Consul of Rome," closes the act, in a manner intended to be impressive, but which the critics and ourselves seem to agree in considering almost burlesque. It will be observed, that for these two acts we have not had even an instant's glimpse of Lucretia.

In the 4th, we return to Collatia at last, and find the heroine, as before, plying the distaff amidst her maidens. She is anxious for news from the camp; a weight preys upon her spirits; omens have alarmed her; and above all, she is still trembling at the recollection of a terrible dream, which she relates to her nurse. The most striking part may be rendered as follows:—

'Twas in a temple, 'midst so vast a crowd,
Methought that Rome had summoned all her sons
Within the walls; and all were there at once:
While, yielding to the flood that filled the space,
The hall still wider grew to give them place;
The priest Quirinal then, to please the shade
Of Romulus, his solemn offering made.
And now, the victim of the altar led,
The priest, with salt and meal, had strewn its head;
And having poured the wine of sacrifice
Where on the frontlet broad the horns arise,
He cried, "Quirinus! these libations take,
And this our Rome the first of nations make!"
He ceased: in awe suspended paused the crowd;
At once was heard a mighty voice, so loud,
That the dome shook: "Away with sheep and kine!
What worth has blood of beasts in fanes of mine?
'Tis human blood I ask:—the purest shed,—
A woman's blood,—and Rome the world shall lead!"
Thus spake the god; and straight, by means unknown,
The victim vanished from the altar stone;
And in its place, outstretched, I lay:—and lo!
While trembling there, I wait the axe's blow,
A column yawns; and from its centre springs
A serpent forth; then rolling on his rings,
Trails wallowing to my feet his tortuous way,
Lingering and long, as certain of his prey.
He climbs—he clips me with his clammy ties—
I feel my hair erect with terror rise,
And my flesh quiver in the loathsome clasp;
But, parched with fear, my throat can only gasp;
I try to move, in vain! for horror cold
Congeals my limbs; the monster, fold on fold,
Constrains me like a giant's arm; his head
Gapes o'er me, with its sword-like sting displayed,
My eyes devours with eyes that rage and glow,
And breathes the grave's rank odour on my brow;
His sting, as revelling in the promised bite,
Strays o'er my bosom, choosing where to smite!
And then—I saw no more.

This, if not dramatic, is at least a narrative passage of considerable power:—the close of the scene, too, is not without a certain poetical turn, which it would be difficult to find in any other part of the drama. While the nurse is reflecting on the dream, one of the slaves is ordered to attempt to soothe Lucretia's anxiety with some pleasing strain;—she begins:—

Sleep, the mute sovereign both of men and gods,
Pours gently from his urn the drowsy floods;
His languor soft, with penetrating charms,
The cares that prey on human heart disarms.

After a few more verses in the same tone she continues:—

Sweet is the sleep that toilsome hours bequeath;
But Night's first-born is brother, too, of Death!
And many a one, that closed in smiles his eyes,
Wakes only in the gloomy world of sighs:
Nor ever more the radiant day shall view,
Nor see the friends he might not bid adieu.
Nurse. Hush! luckless girl! thy song is full of fear—
Slave. Alas! I sought a strain without a tear;
But my tongue moves beneath some evil spell!
Lucretia. Appalling signs! what fate may these foretell?

Digitized by Google

At this moment Sextus Tarquin enters, and, pretending to bring news from Collatinus, induces Lucretia to dismiss her maidens; and when alone with her, breaks out into an ardent declaration of love. To win her more readily to his wishes, he tries to tempt her with the offer of a divorce from Collatinus, and the promise of raising her to the throne of Rome, which he proclaims the design of making more absolute and splendid than even under his father's tyranny. Lucretia, startled at first by his audacity, soon recovers herself; rejects his love, and declaring inviolable attachment to her husband, repels Tarquin's offers with contemptuous dignity. The seducer is abashed by the coldness of her scorn, and, pretending that his only intention was to make another trial of her virtue, congratulates her on its triumph. Lucretia, barely feigning to accept his excuse, leaves him, with the command to retire from the dwelling, where his presence is unwelcome, as soon as daylight returns. His courage falters; he recollects the Sibyl's menaces, and the apparition of Tullia, which crossed him on entering the house of Collatinus; but the taunts of his creature, Sulpicius, revive his audacity; and in a kind of reckless fury he rushes into the chamber of Lucretia. This should be the most effective crisis of the tragedy; but it is tamely written. Tarquin woos more like a pedant than a prince, and ends his address like a craven: the evasion in which he tries to hide his failure is both common-place and inconsistent with any idea of the character.

The fifth act is little more than a diluted version of Livy's narrative. The aged father of Lucretia, her husband, and Brutus, have been summoned by the victim: she appears in mourning, relates, in a few words, the outrage committed by Sextus, and after hearing them vow to avenge it, stabs herself; refusing, in spite of the consolations of her father and husband, to bear the disgrace, and live to be cited hereafter as an excuse for the frailties of wives. At this moment Brutus throws off his supposed idiotcy; an oath of vengeance is sworn over the corpse of Lucretia; the citizens, hastily summoned, rush in, and surround the body; while Brutus harangues them at some length, and having raised them to the highest point of indignation against the Tarquins, marches at their head to the deliverance of Rome. The management of this act is so feeble, that we do not venture to translate any part of it. Whether read or acted, it scarcely excites any emotion; and after Lucretia's death, the consternation and grief which it should excite are so frigidly expressed, that the oration of Brutus, which otherwise would seem intrusive at such a moment, is almost felt to be a relief.

The strength of the work, whatever it may be, lies in its set speeches. To those who care little for such exercises of rhetoric, but require from tragedy powerful emotions, and the natural language of passion, M. Ponsard's 'Lucretia' will afford little pleasure: our French neighbours look at the drama in a different light, and forgive much for the sake of vigorous declamation and glittering phrases. Of these, we are probably incompetent judges; and will suppose that what was so much admired at the Odéon must contain less tinsel and more sterling merit than foreign eyes can discover. M. Ponsard is said to be only twenty-four, and may yet do better things—in the meanwhile his triumph has been a brilliant one; and, however marvellous it may appear to English critics, they may willingly confess that it has been gained without intrigue, or interest, or the recommendation of a celebrated name:—and that the public, for whom a poet writes, are, after all, the only judges he is bound to please.

Notices of the Castle and Priory at Castleacre. By the Rev. J. H. Bloom, B.A. Pelham Richardson.

A local history is always welcome, because it has always some value—the more or less depending on circumstances. In compiling such a work, every country gentleman and every clergyman could profitably and pleasantly devote a little of his leisure to useful purposes; but unless he is something more than the name or office necessarily implies, he must confine himself to compilation, condensation, facts, and observation. Mr. Bloom appears to be of a different opinion, and does not think it necessary to be brief, merely because his subject is barren. He therefore favours the reader with an account of monachism, and particulars of the Cluniacs, compiled from the most familiar sources, and accessible to all in Fosbrooke, because Castleacre Priory was an establishment of Cluniac monks; of the De Albany family, of which a much better account may be found in Dallaway and half a dozen other writers; of the prevailing characteristics of Norman architecture, the origin of surnames, &c.—just the elementary talk met with in a hundred volumes. Still the work is readable and well illustrated, and may be acceptable in the neighbourhood. It is strange, however, how few facts it contains of interest to the public generally. The following is among the most curious:—

"Henry de Rie, a companion of the Conqueror, by his will, without date, bestowed upon the monks of Acre, his mill, situated at Worthing in Norfolk, *together with* Thurston the miller, his (Thurston's) *mother*, and *brothers*, and *all their substance!*"

Among the relics possessed by the neighbouring Priory of Westacre was a finger of St. Andrew, mounted in silver:—

"Upon some occasion the chapter rather profanely *pawned* this ingenious specimen for no less a sum than forty pounds sterling, (an amount at the lowest computation equivalent to 400*l.* of the present value,)—a pledge which they had not the good fortune to redeem up to the time of the surrender, when the king's commissioners absolutely refused to do so on the plea that it was not worth a fortieth part of the money!"

In 1837, in clearing away the soil from the south aisle, near the chapel, a stone sarcophagus was discovered:—

"The sarcophagus, of thick but friable stones, perfectly plain, and to all appearance of ancient date, had in all probability been removed from some other spot to its present destination. A shallow grave had been dug beneath the pavement of the aisle and its bottom coated with cement. Upon this the body of the deceased was simply laid, wrapped in a shroud of coarse sackcloth, which was found still retaining its folds and encircling the skeleton; while over all, the sarcophagus, void of any operculum or cover, was *inverted*. It is remarkable, that although the bones were found as described, wholly undisturbed in their humble shroud, and perfect in all other respects, the most careful search failed to discover any trace of the skull or of the feet!—in fact, it was ascertained upon inspection, that these members had been respectively amputated prior to the interment of the body,—the one from the vertebræ of the neck, the other just above the ankle joint. No motive of necessity could have prompted this expedient, for the sarcophagus was not only of ample length for a full-grown subject, but was furnished with the usual cup-like recess at its upper end for the reception of the head of the deceased. An experienced medical friend, to whom the bones were subsequently shown, pronounced them to all appearance to be those of a female, and what dark tale of wretchedness, misery, or crime, might they not shadow forth? The whole circumstance, the mutilated state of the body, the penitential character of its envelopment, the singular mode of its sepulture, the conspicuous position of the tomb,—all seem to point to some transaction of grief, or guilt, or tyranny, that may supply ample scope for the exercise of imagination."

Some strange and startling customs seem to prevail in the district, which carry us back in imagination to the days of Henry de Rie:—

"The population of Castleacre, according to the census of 1841, amounts to 1494 souls. The inhabitants are exclusively agricultural, and generally of a very humble caste; although abject poverty happily does not exist among them, still their means are exceedingly moderate, and the degree of intelligence prevalent, as usually happens, is proportionate to the extent of their resources. It has been the fashion to single out the parish of Castleacre as the most conspicuous in point of demoralisation and general depravity within the circuit of many miles, and until within the last few years there has been, we fear, but too strong ground for the conclusion; but then it is only justice to indicate the main source of this evil, and the still-existing obstacle to its effectual eradication. It is simply this: A custom has for many years prevailed in the place, and been encouraged by the occupiers in adjacent parishes, to farm out the work necessary to be done on their respective lands to one or two individuals, who shall provide hands to accomplish it in the best manner and on the most reasonable terms. These parties are termed *gang* masters, and a very significant term it is, for surely no gang of wretched slaves beneath the sweltering sun of the tropics, could materially fall beneath the generality of persons thus assembled together in intellectual debasement and moral depravity."

We are happy to learn from Mr. Bloom that a custom so obviously demoralizing is on the decline.

Puritan Discipline Tracts. Reprinted from the Black Letter Edition. Petheram.

The tract before us is the first of a proposed series of republications of the furious controversial pamphlets which appeared at the close of the sixteenth century, in the beginning of that intemperate war between the Dissenters and the Church which terminated in the temporary overthrow of both throne and altar. The tract is one of the many thunder-bolts of the notorious Martin Mar-Prelate, the theological Captain Rock of his times, and is entitled "An Epistle to the Terrible Priests of the Convocation House." It does not exceed in length a shilling pamphlet of Ridgway's, a brevity the more to be commended when it is considered that it was launched in reply to a quarto of 1500 pages, namely "Dr. John Bridges' Defence of the Government of the Church of England, for Ecclesiastical matters, against a treatise of Ecclesiastical Government, &c." Neale, in his History of the Puritans, observes of this tract, that it contains "a great many sad truths, but delivered in rude and unbecoming language, and with an angry spirit." In his introduction the editor thinks it prudent to—

"Disclaim any personal or politico-religious feelings in bringing once more before the world these curious productions of by-gone times. Personality and scurrility were used freely by the Martinists and their opponents; and however much it is to be wished that they had written with a gravity and decorum more suited to the object they had in view, I could only give that which I found, faithfully and unreservedly, and this I have done."

Such an apology was hardly called for, so indispensable is an acquaintance with the polemical literature of the age in question, to a perfect understanding of its character and history. Independently of this, the interest of these works as literary curiosities is considerable: no museum of literature can be complete without them; and moreover, in the light of materials towards the construction of an art of scolding or science of termagancy, equally applicable to political conflicts and religious squabbles, they hold a very high place indeed. There is a fine fish-wife strain of rhetoric in the very title-page of the first number of the series. "Oh read ouer D. Iohn Bridges, for it is a worthy worke;" then this

Digitized by Google

Bridges is described as "Presbyter, Priest or elder, doctor of *Diuillitie*, and Deane of Sarum;" and the epistle is stated to have been "compiled for the behoofe and overthrow of the Parsons, Fyckers, and Currats, that have lernt their Catechismes, and are past grace!" Before Martin has advanced six pages he waxes so hot, that he denounces the prelates as "pettie Antichrists, pettie popes, intollerable withstanders of reformation, enemies of the gospell, and most couetous wretched priests." But he is full of tender mercies for the Bishop of London:—"I will spare Iohn of London for this time, for it may be he is at boules, and it is pitie to trouble my good brother, lest he should sweare too bad." Martin delighted vastly in alliteration; hence in the next paragraph the heads of the Church are complimented with the following string of epithets—"proud, popish, presumptuous, profane, paultrie, pestilent and pernicious." He does not long refrain from Iohn of London, who is successively named "Don Iohn of London," "Dumb Iohn of London," "The Lord Dumb Iohn," our "Worshipful *Paltripolitane*," with twenty other variations of the same air; and in the same vein, the Primate is addressed as "His Gracelessnesse of Cant!" But John of London is charged with stealing thirty pounds' worth of cloth, and the facts of the larceny are stated circumstantially, the accuser mentioning the names of the persons alleged to have been robbed by the holy Bishop, and adding—"they dwell at the Old Swan in Thames Street; I warrant you Martin will be found no liar, he bringeth in nothing without testimonie." He then follows up this strange indictment by an anecdote of Mistris Lawson the Shrew, who could not well have been more shrewish than Martin himself, whether Dumb John of London stole the broad-cloth or not:—

"It was not therefore for nothing (Iohn of London I perceiue) that Mistris Lawson the shrew at Pauls gate, and enemie to all dumb dogs and tyrannicall Prelates in the land: bad you throw downe your selfe at hir Maiesties feet, acknowledging your selfe to be vnsauory salt, and to craue pardon of her highnes, because you had so long deceiued her and her people: You might well ynough craue pardon for your theft, for Martin wil stand to it, that the detayning of the mens cloth is plain theft."

Here is a fine piece of oratory after the manner of Xantippe:—

"Well nowe to mine eloquence, for I can doe it I tell you. Who made the porter of his gate a dumb minister? Dumbe Iohn of London. Who abuseth her Maiesties subiects, in vrging them to subscribe contrary to lawe? Iohn of London. Who abuseth the high commission, as much as any? Iohn London, (and D. Stanop to). Who bound an Essex minister, in 200.l. to weare the surplice on Easter day last? Iohn London. Who hath cut downe the Elmes at Fulham? Iohn London. Who is a carnall defender of the breache of the Sabboth in all the places of his abode? Iohn London. Who forbiddeth men to humble themselues in fasting and prayer before the Lorde, and then can say vnto the preachers, now you were best to tell the people, that we forbidd fastes? Iohn London. Who goeth to bowles vpon the Sabboth? Dumbe dunsticall Iohn of good London, hath done all this."

He make you weary of it dumbe John, except you leaue persecuting.

A squabble between the same unlucky prelate and a certain Mr. Madox is related at length, and affords a good illustration of the manners and wit of the times. We quote the conclusion of this facetious affray:—

"At the hearing of this speeche, the waspe got my brother by the nose, which mad him in his rage to affirme, that he woulde be L. of Fulham as long as he liued, in despight of all England. Naye softe there, quoth M. Madox, except her Maiestie I pray you, that is my meaning, ka dumb Iohn, and I tell thee Madox, that thou art but a Iacke to vse me so: master Madoxe replying, sayd that in deed his name was Iohn, and if euery Iohn were a Iacke, he was content to bee a Iacke (there he hit my L. ouer the thumbs). The B. growing in choller, sayd y^t master Madox his name did shewe what he was, for sayth he, thy name is mad Oxe, which declareth thee to be an vnruly and mad beast. M. Madox answered againe, that the B. name, if it were descanted vpon, did most significantly shew his qualities. For said he, you are called Elmar, but you may be better called marelme, for you haue marred all the Elmes in Fulham: hauing cut them all downe. This farre is my worthy story, as worthye to bee printed, as any part of Deane Iohns booke, I am sure."

There is small reason to think that the Church party at the period in question were much more temperate in speech than their assailants, notwithstanding they had keener weapons of controversy than the tongue, which was the Puritan's only tool. Martin records a scene in the Court of High Commission, in which the Church proved herself a fair match for the Conventicle in the gifts of Billingsgate:—

"The case thus stoode, Iohn Penrie the welsheman (I thinke his grace and my brother London, would be better acquain[ted] with him and they could tell howe) about the begining of Lent, 1587, offered a supplication and a booke to the Parliament, entreating that some order might be taken, for calling his countrie vnto the knowledge of God. For his bolde attempt, he was called before his grace with others of the high commission, as Thomas of Winchester, Iohn London, &c. After that his grace had eased his stomacke in calling him boy, knaue, varlet, slanderer, libeller, lewde boy, lewd slaunderer, &c. (this is true, for I haue seene the notes of their conference) at the length a poynt of his booke began to be examined, where nonresidents are thought intollerable. * * This point being a long time canuassed, at the length his worship of Winchester rose vp, and mildly after his manner, brast forth into these words. I assure you my Lords, it is an execrable heresie: An heresie (quoth Iohn Penry) I thanke God that euer I knewe that heresie: It is such an heresie, that I will by the grace of God, sooner leaue my life then I will leaue it. What sir, (quoth the Archb.) I tell thee it is an heresie, and thou shalt recant it as an heresie? Naye (quoth Penrie) neuer so long as I liue godwilling."

The John Penrie of this scene is supposed to have been Martin Mar-Prelate himself. He was called "the hot Welchman," and suffered martyrdom in the Puritan cause in 1593, a year of vigorous operations against heterodoxy. In the beginning of that year, Queen Elizabeth summoned a parliament and opened it with a speech in which, amongst other things, she enjoined the Speaker, Sir Edward Coke, "if he perceived any idle heads so negligent of their own safety as to attempt reforming the Church, or innovating in the Commonwealth, that he should refuse the bills exhibited for that purpose, till they were examined by such as were fitter to consider of these things and could better judge of them." This high tone only inflamed the Puritan spirit the more. A daring position was taken up by some members of parliament of that persuasion, and a series of violent enactments were accordingly proposed by the Government and acquiesced in by the Commons. The bishops were particularly furious, and determined to hunt down the Puritan pamphleteers. Their lordships were not so far advanced in political science as the great philosopher of their age, from whom they might have learned that "the punishment of wits enhances their authority, and a forbidden writing is thought to be a certain spark of truth that flies up in the face of those who seek to tread it out." However, under one of the intolerant laws referred to, Penry, or Ap Henry, was pounced upon by his mitred enemies, and assassinated by the hands of a sheriff, with scarcely the bloody forms of the law. That his conviction was illegal seems to be beyond a question, for he was indicted under an act to punish the utterance of seditious words and rumours, and found guilty upon the evidence of private unpublished papers, found in his possession when he was arrested. Neale records this barbarous proceeding as follows: "It never was known before this time, that a minister and scholar was condemned to death for private papers found in his study; but Penry must die, right or wrong. The Archbishop was the first man that signed the warrant for his execution. The warrant was sent immediately to the Sheriff, who the very same day erected a gallows at St. Thomas Waterings; and, while the prisoner was at dinner, sent his officers to bid him make ready, for he must die that afternoon. Accordingly he was carried in a cart to the place of execution. When he came hither, the Sheriff would not suffer him to speak to the people, nor make any profession of his faith towards God, or his loyalty to the Queen, but ordered him to be turned off in a hurry about five o'clock in the evening." If Penry was Martin Mar-Prelate, the bishops had ample vengeance for the foul language with which they were assailed in his tracts; but it was not the foul language of the Puritans, we may be sure, that most incensed the hierarchy of that day. Mixed with the coarsest vituperation will be found in the pamphlet before us some passages of the most earnest and vehement remonstrance. To argue, however, with the Church was not so much the writer's object as to inflame the people. Pamphleteering was the agitation of the day; and, powerfully aided as it was by the more inflammatory effects of persecution, it did its work to admiration.

Events of a Military Life. By Walter Henry. 3 vols. Pickering.

THIS work comes out under the "*imprimatur*" of the *Quarterly Review;* but with admiration somewhat less enthusiastic on the part of the *Athenæum.* The "style medical" is apt to be flippant and prosy; whether it be the production of a Travelling Physician, who recounts the secrets of his patients, or of a pilgrim among the English spas, who disdains not to adapt his paragraphs to the level of circulating library tattle, or of an army surgeon, who imagines that he joins some of the attractions of Adonis and Mars to the skill of Æsculapius. Thus the reader of Mr. Henry's good-humoured peninsular recollections will find something of the tone of O'Shaughnessy in the loving and complacent mention of the "leedies." The Indian "Events," too, include a vision of "the graceful form of S—— dressed in bridal white, and her fair countenance radiant with smiles;" in one hand a sealed letter, in the other a nosegay of orange flowers! In Canada (about which time the author took to himself a Mrs. Henry) he becomes more political; abuses Papineau, Wolfred Nelson, and Mr. Roebuck—and discusses the Aylmer, Gosford, Durham, and Sydenham administrations. We are willing to hand over colonial politics to be wound up by Sam Slick, and will not, therefore, vex the apprehensive public by any new speculations or extracts touching matters so thorny. The most welcome part of the book is that containing the reminiscences of St. Helena. Mr. Henry was there during the latter period of Napoleon's captivity—at the Emperor's death; and accompanied the followers of the deposed agitator to England. The side he takes may be easily divined; the chained Lion was, in his judgment—

—no such great things after all!

Sir Hudson Lowe has been persecuted with unmerited calumny; O'Meara was a mercenary intriguer, &c.: thus runs the argument. Having warned the reader of the colour of Mr. Henry's glass, he shall now look through it, for—

An Interior at Longwood.

"On the afternoon of the 1st of September, 1817, the officers of our regiment, with Sir George Bingham and Colonel Nicol at their head, repaired to Longwood. We called at Marshal Bertrand's, fifty or

Digitized by Google

sixty yards from the residence of Napoleon, to pick up the Marshal, who accompanied us to the billiard-room, where we found Count Montholon and General Gourgaud. After waiting five or six minutes, the folding doors of the ante-chamber were thrown open, we entered, formed a ring round the room, according to seniority, and in about a minute Napoleon walked into the circle. He was dressed in a plain dark green uniform coat without epaulettes, or anything equivalent, but with the star of the Legion of Honour on the breast, which had an eagle in the centre. The buttons were gold, with the device of a mounted dragoon in high relief. He had on white breeches and silk stockings, and oval gold buckles in his shoes; with a small opera hat under his arm. Napoleon's first appearance was far from imposing, the stature was short and thick, his head sunk into the shoulders, his face fat, with large folds under the chin; the limbs appeared to be stout and well proportioned, complexion olive, expression sinister, forbidding and rather scowling. The features instantly reminded us of the prints of him which we had seen. On the whole, his general look was more that of an obese Spanish or Portuguese friar, than the hero of modern times. Buonaparte walked round the room with an attempt, as it seemed, at the old dignity, and addressed a few words to most of the officers. Colonel Nicol was first introduced by Sir George Bingham, he and Marshal Bertrand acting as interpreters. The following conversation then took place, which, as well as the whole proceedings on this memorable occasion, I copy from minutes noted down immediately after the interview.

"*Napoleon.*—'Your Regiment has lately arrived from India; coming from that rich country you should wear gold, and not silver. How many years does it take to acclimatize a regiment of Europeans?' *Colonel Nicol.* 'Two or three years. A few die the first year, more the second, but the mortality is much reduced during the third.'—'Did your officers save much money in India?' 'No; the expense of living is too great.'—'How many servants did you keep there?' 'I had at one time between thirty and forty—I think thirty-nine.'—'Do you think a regiment is efficient after twenty years' service in India?' 'Yes: it is fed by recruits from home.'—'What kind of troops are the Sepoys?' 'Those in the British service are excellent troops.'—'How many battalions of Sepoys, of equal strength, would you engage with the 66th?' 'Do you mean battalions with British officers or without them?'—'Both the one and the other.' 'Sepoy regiments with British officers are good and steady soldiers. I should not like great disparity of force with them, though I might manage to defeat four or five battalions belonging to the Native Powers with the 66th, and I am pretty sure we could.'—'Very good. You are a fine fellow. (Un brave homme.)' 'How many officers have you in your mess?' 'Sixteen at Deadwood.'—'You sit very late at the mess, I hear—often till midnight.' 'O yes; when we have a few good fellows there, we sometimes don't stir till cock-crow.'—'But the officers get tipsy then, don't they?' (then in English—'Drunk—drunk—eh?') 'O no, no, they don't get drunk.'—'Your men, I perceive, walk about very much in the sun, and without their caps. That's wrong.' 'It is, and we do all we can to prevent it.'—'Have you not a Catholic officer in the regiment?' 'Yes,' (with a nod at Lieutenant M'Carthy, who stood nearly opposite, at the other side of the circle).—'He has been to Rio Janeiro lately, I hear.' 'Yes, and is just returned.'—'He went there to get absolution, for his peccadillos, I suppose?' (Repeated, 'Absolution, n'est ce pas?') (Answered by a laugh from Colonel Nicol, and a blush on the honest, and naturally rubicund, physiognomy of the officer in question.) Napoleon then turned to Lieutenant-Colonel Lascelles—'What countryman are you?' 'An Englishman.—'From what part of England?' 'From Yorkshire.'—'Were you born in the city of York?' 'No.' He then passed to the next senior officer, Lieut.-Colonel Dodgin, C.B., who had several clasps and medals on his breast. He was, besides, a remarkably fine, military-looking man, much resembling the late Duke of York; and twice on one day, when walking with the Author in London, a gentleman saluted him by mistake for that prince. Napoleon looked at him with some complacency, and took hold with his fingers of the most glittering of the batch of distinctions, which happened to be the Vittoria medal; but as soon as he read that 'word of fear,' he dropped it instantly, and rather abruptly. It was no mere fancy of mine, but a matter of plain fact, observed and spoken of at the time by us all, that his gesture was exactly that of a person letting fall something unexpectedly and disagreeably hot. He then addressed the Colonel:—'You have decorations, I see. Where did you serve?' 'In Egypt and the Peninsula.'—'Were you at Salamanca or Thoulouse?' 'No.'—'Was your regiment at Talavera?' 'Yes.'—'Were you ever wounded?' 'Yes—twice.'—'Was your name sent home as an officer who had distinguished himself?' (Here Colonel Dodgin hesitated, when Captain Baird answered for him) 'Yes—three times.' Buonaparte next addressed Captain Baird:—'You are a Captain of Grenadiers!' 'Yes.'—'How many years have you been in the service?' 'Nearly twenty.'—'And still only a Captain?' 'Even so.' Next Captain Jordan passed the ordeal. He was married to a handsome St. Helena lady, whom he had met in Bengal, whose father's house was not more than a mile from Longwood. The following short dialogue passed:—'You are married?' 'Yes.'—'Your wife is pretty, I hear? How many children have you?' 'Two.' Next was Captain Dunne:—'You have been in India?' 'Yes.'—'How long have you served?' 'Fourteen years.' Napoleon then glanced at the next officer, Captain E——, a man of most uncouth and forbidding exterior and physiognomy; but not being pleased with his appearance, he passed him by, and proceeded to address Captain L'Estrange, a most worthy little fellow, but of very dark complexion:—'Have you served in India?' 'Yes.'—'How long have you served?' 'Fourteen years—two in India.' (There seemed to be some mistake made here by the interpreters, in confounding the entire services of this officer with the time passed in India.)—'How is it your complexion is so dark? Were you sick in India?' 'No.'—'Do you drink?' (and then translating the French—'Drink? Drink?) (Answered by a smile.)—'Which do you think the best town—Calcutta or James's Town! (Repeated in English by the querist) 'Veech do you tink de best town?' 'Calcutta.' Next in the circle stood Captain Duncan:—'How long have you served?' 'Upwards of twenty years.'—'You have been in India?' 'Yes.'—'Were you ever in action?' 'Yes.'—'And ever wounded?' 'No.'—'Then you are a lucky fellow.' Buonaparte then addressed Mr. Heir, the Surgeon:—'You are the Surgeon of the Regiment?' 'Yes.' Do you hold any other commission?' (This question was answered by Sir George Bingham) 'This gentleman is the Surgeon Major' (not unhappily considering that my excellent amigo, Heir, was then, and I hope still is, about six feet and a half high); and then there was some confusion, and the interpreters were a little at fault; confounding Surgeon Major and Sergeant Major; Sir George not being perfect in French, and Marshal Bertrand very defective in his English. At length Napoleon said:—'Lord Wellington promoted several of his Surgeon Majors, I have heard?' Sir George Bingham again remarked, 'Pardon, Sire (but this Imperial recognition, which had never been sanctioned by the British Government, was evidently a lapsus of the moment), pardon, it was the Sergeant Majors; several of whom got commissions during the Peninsular war.' To Mr. Heir:—'You had a great many sick in India?' 'Yes, it is not a healthy climate.'—'Many liver complaints?' 'Yes.'—'Do you prescribe calomel largely?' 'Yes.' Next in order was Lieutenant Moffat:—'What countryman are you?' 'An Irishman.'—'Are you a Catholic or a Protestant?' (With marked and somewhat indignant emphasis) 'A Protestant.' Buonaparte now moved somewhat quicker than before round the circle, passing by some of the officers without speaking to them, after individual introduction, and addressing merely a word, as to length of service, to one or two others. When he arrived at the point where I stood, Marshal Bertrand made me a bow of recognition; on which the great man stopped, and the Marshal formally introduced me as the English Physician who had recently attended his eldest son, Napoleon's little namesake and favourite. He then looked at me with a slight expression of complacency, and said:—'You have served in India?' 'Yes.'—'You had much professional duty there?' 'A good deal, certainly.'—'Were diseases of the liver very common in India?' 'Yes, they occur there more frequently than in colder climates.'—'Your soldiers drink an enormous quantity of brandy in India?' 'They are much too fond of spirits; arrack is cheap there, and the climate makes them thirsty.'—'Do you bleed and give large doses of calomel there, as the English doctors do here?' 'I believe the practice is similar.'—'Are you, too, a devotee of the lancet? Ah, God defend me from it!' ('Ah, Dieu m'en garde!') 'In my opinion it is our most potent weapon.'—'To kill or cure, eh M. le Docteur?' 'It is our duty to cure.' Then Ensign Wardell:—'You are a young man. How long have you served?' 'Seven years.'—'You entered the service very young, then!' 'Yes, but I served in the Navy.'—'You were a midshipman?' 'Yes.' One or two more were asked one question as to length of service, and the round was completed. Napoleon then addressed Colonel Nicol a second time:—'So, the Sepoys are good troops?' 'Yes, they are excellent soldiers, respectful, sober, and obedient.'—'But yet you would fight five or six of their battalions with your own regiment?' 'Not Sepoys with British officers. I should not like to engage two such battalions.' A few sentences were then exchanged between Buonaparte, Marshal Bertrand, and Sir George Bingham; and we all bowed and retired."

Some readers may find military details more to their taste than the above conversation; others revel in a retrospect of salmon-fishing; both parties may be safely referred to the army-surgeon's book. To ourselves, it has been forestalled by earlier and less laboured productions.

OUR LIBRARY TABLE.

The Busy Body, 3 vols.—Weak, well-intentioned small talk, but neither unpleasant nor unwholesome. Aunt Gatty, indeed, the Busy Body, is a character, which is more than can be said for most of her contemporaries. She is a sweet-tempered, single gentlewoman; as puzzle-headed as Mrs. Nickleby, though never reaching the sublime of that eminent woman's reminiscence, that "the name began with B and ended with G, and perhaps was Waters." With an affectionate desire to do right, her mischievous performances are nevertheless illimitable, owing to the mistiness of her conceptions, or her taking in its most literal sense every word of *persiflage* bandied about between three gay young gentlemen and two gay young ladies. She also falls a victim to her knitting and nursing propensities, in a thousand ridiculous ways we shall not attempt to describe. Yet, though possessing every quality of a bore, and provoking us as often as the book has pages, by her disposition to explain, advise, confess, and encourage, we do more than like—we love her to the last, and are glad that the authoress has spared her the humiliation of a husband to "wind up the charm" of her adventures, as, for a while, seemed possible. The personages who hover round her are more commonplace: one a weak copy of Richardson's brilliant Lady G——, with a lover to match;—another pair made up of thorough-going sentimentalists, whom it required some ingenuity to keep asunder till the middle of volume the third, where they join hands. A third gentleman is secretly married to a mysterious wife, who is the only wicked personage in the book. The dark-browed Leonora has been obviously anything but a favourite with the good-tempered authoress, and she is removed with as little emotion as was shown (so runs the legend) by the Mandarin, when his beloved Lee-Chee was, by a sun-stroke, reduced to a heap of ashes: "*Sweep away your mistress*," said the dignitary to his servant, "*and bring us clean pipes.*" In short, those who have a taste only for strong emotions need not seek the acquaintance of 'The Busy Body.'

Reminiscences of Syria, by Lieut.-Col. G. Napier. 2 vols.—As the author disclaims all pretension to literary merit, we shall not comment on his very military style—neither are we disposed to be severe on the pardonable vanity which has led him, in almost every other page, to introduce the name of his father, 'the gallant old Commodore.' Commodore Napier did what few could have done; he gained more than one victory at the head of Turkish troops, and his energy contributed greatly to put an end to war in the East: but then he has told us so himself at least half a dozen times, and as nobody disputes

Digitized by Google

the facts, it is hardly fair to inflict them on us again. The son served in Syria on the staff of Sir C. Smith, and of course scampered over the country in all directions, and his hurried observations are here recorded in two volumes. The idlers who are just now enjoying the quiet of the country may find them amusing enough to beguile away a few hours on a rainy day—but they are too slight of texture and too superficial in character to justify criticism.

An Appeal in behalf of Colonel Stoddart and Capt. Conolly, by Captain Groves.—Our readers will remember that some time since we announced the reported murder of Messrs. Stoddart and Conolly by the authorities of Bokhara. Captain Groves, a friend of Col. Stoddart, states in this pamphlet that, disbelieving the account of their death (and we must admit that the evidence is inconclusive), he offered to go to Bokhara at his own cost and expense, and if possible determine the question, provided the Government would allow him to travel in the character of an authorized British agent. This, however, was declined, but Lord Aberdeen offered all the aid in the power of the Foreign Office if he were content to travel as a private gentlemen. Capt. Groves now appeals to the public in favour of the well known missionary, Mr. Wolff, who has volunteered to go to Bokhara and ascertain the fate of our unfortunate countrymen, if merely his travelling expenses, amounting to 500*l.*, be paid, without demanding any compensation for his trouble. Capt. Groves, throughout his pamphlet, accuses the Government boldly and broadly of indifference to the fate of our countrymen—officers employed by themselves, and on a mission to Bokhara.

Life in the Ranks, by Sergeant-Major Taylor.—The remarks which we made on the Sergt.-Major's recent work on Affghanistan (No. 823) would apply equally well to the one before us. It has little personal interest, and Life in the Ranks has been described often and better before. At the same time, we must add, that it is modestly and earnestly written.

Strafford, a Tragedy, by John Sterling.—The number of recent plays founded on the English history of the seventeenth century is worthy of remark. Miss Mitford, Sir E. L. Bulwer, and Victor Hugo have each essayed the character of Cromwell—Mr. Serle has attempted to throw a gleam of interest over the career of Cromwell's unambitious son—Mr. Browning tried his skill on Strafford—and the dramas and dramaticles setting forth the exploits of the merry monarch are beyond all reckoning, and not worth specific record, though we must indulge ourselves by naming Mr. Jerrold's charming 'Nell Gwynne.' Could graceful thoughts and philosophical dreams, with a strange blending of reserve and enthusiasm of manner, make the dramatist, Mr. Sterling would stand a fair chance among his competitors—but construction, character, life, and animation are wanting. He is as rhetorical as Mr. Taylor, without Mr. Taylor's consistency of character and attention to climax; as vague sometimes as Shelley the Poet, (not Shelley the Dramatist, the 'Cenci' being remarkable for nerve and directness of expression,) without Shelley's exquisite power over colour, and music, and fantasy. His notions of stage-effect go no further than artifices at once puerile and melo-dramatic, which he himself would be foremost to denounce were they executed in his presence, while his visions of Strafford, Charles, Henrietta, Lucy Countess of Carlisle his heroine, and Pym, the dark shadow of the Royalists, are "sicklied over" by an interposing medium, which gives them a pale and unreal monotony. We read, but we do not see: we listen, but without believing. The enamelled and feeble family likeness of Chinese portraiture pervades the whole party, save and except when the Countess breaks out into a fit of scolding, violent enough, in a drama of such strange quietism, to startle the sympathetic dreamer. We are sorry we cannot make a more favourable report of the work of one who has given us pleasure in other exercises of thought and fancy.

Wellington, a Poem, in three Parts, with Historical Notes, by Henry Holt.—Clio was somewhat outrageously called upon by our ambitious author, to help him to sing the glories of the Hero of Waterloo. The elderly gentlewoman, however, frightened (and no wonder) at Mr. Holt's obstreperous proceedings, would not "come when she was called," leaving the rhymester to work his own wicked will on his subject. But though neither Clio nor the Duke, we suspect, will attend to Mr. Holt, we were bound by virtue of our office to give him a hearing—and a weary waste of time it has been.

Ninth Report of the Commissioners of National Education in Ireland for the year 1842.—We are glad to learn from the Report that the number of national schools in Ireland has increased, since 1841, from 2,337 to 2,721, and the number of children taught from 281,849 to 329,792; and that the Commissioners still hold on in a steady course, on the same principles on which they started. These principles are defended in this Report at some length, against the aspersions of the Church Education Society, and the arguments adduced are forcible, and in our opinion conclusive.

A Bibliographical Essay on the Scriptores Rerum Germanicarum, by A. Asher.—This essay contains a list of the various collections of the historians of Germany; another in which they are classed under the various epochs which they have described, and a third arranged in alphabetical order. To the bibliographical and historical student this essay will be acceptable; while the philologist may learn from it the treasures garnered for his use in the shape of essays on the remains of the languages of the different German tribes.

Narrative of H. J. Marks, written by himself.—Our attention has been especially called to this work, which we should otherwise have allowed to pass without comment. It is a narrative of the "trials and persecutions" as they are called, undergone by a converted Jew, published as a means to raise money for his relief. We have no reason to question the sincerity of Mr. Marks, but as he appears, like many other converts, to have turned his conversion to profitable use, and to have lived on it for some years, his conduct is justly open to suspicion; and there runs throughout his Narrative that established phraseology which reads very like cant, and makes it exceedingly distasteful to persons of honest minds and healthy appetites.

Hints and Reflections, by Minor Hugo.—A work in illustration of the co-operative system of Fourier. The writer avails himself of the opportunity to expose some of the many rottennesses of existing society, which he does in an inoffensive and good-humoured spirit.

Practical Remarks on Gout, Rheumatic Fever, and Chronic Rheumatism of the Joints, by R. B. Todd, M.D.—The substance of these pages was delivered at the College of Physicians by the author in his capacity of the Croonian lecturer for the year; the work is therefore anything but popular. We may, however, recommend it to our medical readers as containing some new and curious views of the diseases in question, although the reasoning in some instances is less cogent than we could have desired. Dr. Todd's remarks on the indiscriminate use of Colchicum, and the limits within which it is applicable, may tend to arrest some portion of the empirical and routine exhibition of that powerful drug.

Lectures on the Eruptive Fevers, by G. Gregory, M.D.—A concise and lucid exposition of the leading facts and reasonings connected with the subject, and therefore a sufficient text book for students. It is further meritorious as making few demands on the passive obedience of the reader, but rather stating the author's opinions merely as opinions, open for future consideration. Were this otherwise, we might have been disposed to question some of Dr. Gregory's views of Erysipelas and its causes. We now however dismiss them at once, with a *valeant quantum valere possint.*

The Latin Governess, by J. W. Freese, B.A.—Designed to help those mothers who undertake to teach their children Latin grammar without knowing it themselves. As we cannot recommend ladies to undertake any such task, we need give no opinion on the assistance proffered.

Black's Picturesque Tourist and Road-book of England and Wales.—A carefully executed work, prettily illustrated, with useful maps, and well adapted to serve as an outline, to be filled up by local guide-books to the places, worthy of attentive examination; and this perhaps was all that could be expected from a Road-book for England and Wales comprised in one volume.

The Endless Story, in Rhyme.—An imitation of the well-known German 'Story without an End,' designed to convey ethical spoon-meat to the youngest classes of inquirers after truth.

A Voice from the Vintage, by the author of 'The Women of England.'—A defence of the total abstinence system, with no more of novelty or soundness of argument than usually pervades like apologies.

Excursions along the Banks of the Rhine, by Victor Hugo.—We noticed this work long since on its first publication (No. 745), and have therefore only to announce the appearance of this translation.

The Inventor's Manual, by J. T. Danson and G. D. Dempsey,—contains a great deal of information regarding the law of Patents, "What may become the subject of a Patent," "Who may obtain a Patent," &c.—and an advertisement of the Office for Patents conducted by the Authors.

Account of the Museum of Economic Geology, by T. Sopwith.—Intended rather as a general guide to the visitor of this museum, than a catalogue of the contents, and seems well adapted for its purpose.

A Treatise on the Greek Verb, by L. Junius.—One of the many theories on this *vexata quæstio*, which come into and go out of fashion periodically. Junius appeals to scholars to decide his claims, and we must leave them to pronounce judgment; for our readers, we suspect, would not willingly consent to our intermeddling in such discussions.

Sketches of Modern Philosophy, especially among the Germans, by J. Murdock, D.D.—A useful and impartial manual, treating this difficult subject in a rational and easy style. The author avows that he comes forward as a mere historian.

List of New Books.—Hand-Book to the Channel Islands, &c., by Francis Coghlan, 18mo. 2*s.* 6*d.* cl.—Black's Picturesque Road-Book of England and Wales, 12mo. 10*s.* 6*d.* cl.—Ruins and Old Trees associated with Remarkable Events in English History, by Mary Roberts, with illustrations, post 8vo. 9*s.* cl.—Treatise on the Management and Cultivation of Forest Trees, by John Smith, 12mo. 5*s.* cl.—The Child's Guide through the Bible, by W. E. Fletcher, B.A., 12mo. 4*s.* cl.—Personal Declension and Revival of Religion in the Soul, by the Rev. O. Winslow, 2nd edit. fc. 8vo. 5*s.* cl.—The Golden Treasury, being a Guide to Youth in their Social, Moral, and Religious Duties, by W. Pinnock, 12mo. 7*s.* 6*d.* cl.—What is the Church of Christ? fc. 8vo. 3*s.* 6*d.* cl.—Library of Anglo-Catholic Theology, 'Beveridge's (Bishop) Works,' Vol. II., 8vo. 12*s.* cl., 'Cousin's (Bishop) Works,' Vol. I., 8vo. 12*s.* cl.—Novum Testamentum Græcum, editio Hellenistica, 2 vols. 8vo. 2*l.* 2*s.* cl.—A Week at Killarney, by Mr. and Mrs. Hall, small 4to. 12*s.* cl.—Guy's Astronomy, new edit. enlarged, 12mo. 5*s.* sheep.—Guy's Expositor, new edit. 12mo. 1*s.* 6*d.* sheep.—The Antiquities of Freemasonry, by Rev. Little, 8vo. 8*s.* 6*d.* cl.—The Philosopher's Stone, and other Poems, by Manby Hopkins, 8vo. 5*s.* cl.—Francis the First, and other Poems, by J. T. Mott, fc. 8vo. 5*s.* cl.—Henry's Events of a Military Life, 2nd edit. 2 vols. royal 12mo. 12*s.* cl.—Hunting Reminiscences, by Nimrod, illustrated by Wildrake, Henderson, and Alken, royal 8vo. 16*s.* cl.—The Stage Coach, or the Road of Life, by J. Mills, Esq., 3 vols. post 8vo. 31*s.* 6*d.* cl.—The Gem of the Peak, by W. Adam, 3rd edit. 12mo. 6*s.* cl.—Martin's Vagaries, a Sequel to 'Tale of a Tub,' plates, 12mo. 1*s.* 6*d.* swd.—The Lyre and Sword, containing Martial Songs, &c., 32mo. 3*s.* 6*d.* cl.—Cowper's Homer's Odyssey, with Commentary, 2 vols. post 8vo. 15*s.* cl.—Proportion, or the Geometric Principle of Beauty Analysed, by D. R. Hay, 4to. 25*s.* cl.

DAYS' EXCURSIONS OUT OF LONDON.

Panshanger.

THERE are two things at Panshanger which make a visit to the place a bright spot in the reminiscences of a life,—one of the most beautiful works of the great Florentine friar, Bartolomeo di S. Marco—perhaps, it may be said without risk of contradiction, *the* most beautiful in this country—and an oak tree, which for majestic size and symmetrical proportions almost defies rivalry. In the midst of all the thousand works of art which rise above the horizon year after year, and descend without leaving trace of recollection behind them, Fra Bartolomeo's 'Holy Family' stamps an ineffaceable image, which at once takes its place among the treasures of the mind. The oak, too, stands no less remarkable among all memoranda of foliage. But though the tree and the picture are especially singled out for remark, there is much else most pleasant in a journey to Panshanger—a railway ride along a level laid by Nature's own engineering, a well wooded and well watered country, varieties of hill and dale, transit through towns and villages of genuine rusticity, successful examples of luxuriant landscape gardening at Panshanger, and

Digitized by Google

last, though not least, a most comfortable repast at the White Horse at Hertingfordbury.

You will leave the terminus of the North-Eastern Railway, at Shoreditch, not later than half-past nine, A.M., by a train which deposits you at Broxbourne. It is a ride by one of the cheapest, most expeditious, and best managed of railways; first, through the beehive colony of the Spitalfields weavers, over roofs of tiny houses, thickly huddled together as mustard seed, singular among all the habitations of London for their diminutiveness, desolation, dirt, and orderly little gardens,—all, alas! now hushed into silent inactivity, with not a shuttle moving, and suggesting all sorts of melancholy reflections; next, along the green marshes of Isaak Walton's Lea River, without a single cutting to hide the prospects on either side, which on the east, for nearly the whole distance, are bounded by the wooded heights of Epping Forest.

Arriving at Broxbourne station, we shall not stay on the present occasion to examine the church, with its monuments and ancient remains, subjects of architectural interest, or the mill or ale-house celebrated by old Isaak, but at once take carriage to Hertford. We may have a cheap ride for a shilling by the stage coach, which, however, lengthens the journey, by making a circuit through Ware. Private vehicles may also be hired at this station, and a party will judiciously prefer one to the stage, partly because the arrangement shortens the distance, by avoiding Ware, and partly because it spares the walk of three miles between Hertford and Panshanger, and considerably lessens the delay in reaching the principal object of the excursion. The cost between a party of four would not be very alarming. A prudent conductor of the excursion—and such a despot it is always wise to elect for these occasions—will send a notice to the station, and order a carriage the day before the visit.

Hoddesdon and Ware, through which the stage coach passes, have both a rustic air of respectable antiquity. At the entrance to the former there are several old houses of Elizabethan forms and proportions; one, called Champion House, being a residence belonging to the Dymockes, who inherit the right of enacting the pantomime of Champion at coronations, when it is the sovereign's whim to proclaim haughty defiance to rivals' claims. At Ware the coach stops for a few minutes at the inn which formerly possessed the great bed, which made Ware celebrated among the Hertfordshire towns; but we were told that the bed is no longer existent. The coach road between Ware and Hertford runs nearly parallel with the course of the Lea River, the banks of which, for some distance out of Ware, are gaily planted with flowers and shrubs. It would not be unprofitable to have a day's meditation on the history of England, suggested by the materials which might be explored in the ancient town of Hertford. Here, as in other towns purely agricultural, the changes are so slow and gradual, that evidences of the works of many centuries may be traced by those who will give themselves the trouble of investigation. Historical remains at Hertford carry us back to the time of the Danes, who ascended the River Lea as high as the town itself, and erected a fortress there; and the history of succeeding ages may be read in remains of its castle, its old water-mills, churches, streets, &c. At the present time we cannot stay to ponder on the town, and can do no more than advise the companions of our present day's excursion, being in search of works of art, not to pass unnoticed the Old Town Mill, with its waters first still, pent up, black, deeply shadowed, then roaring, struggling for exit, white, scattered into rainbow spray, recalling Hobbema and his magical skill in realizing such scenes. At the western end of the town the road branches northward and southward. The mill stands on the north, which is the road to Panshanger. After a few paces, the road again is divided, and here the tourist will take the south road, following the same until he arrives at the lodge of Panshanger grounds.

He will not pass the gates of the lodge without resolving whether he intends to dine before he returns to town; and if he settles into an affirmative, then let him, with proper foresight, pass on to the village of Hertingfordbury, which is but a five minutes' walk, and, at the White Horse, order his dinner to be ready upon his return from the picture gallery. We can assure him that he will be well taken care of; and every one may judge for himself of the charges by the account of the accommodation. A roasted fowl, stuffed like a turkey—as all roasted fowls, in our judgment, ought to be—ham, broad beans, and other vegetables, with suitable accompaniments of melted butter, a salad dressed with cream, a black currant pudding, which every artist must enjoy, were it only for its intensely rich colour, custard, and home-brewed ale, cost four shillings and sixpence per head—a charge not unreasonable, considering the cleanly style and excellent quality of the supplies. The inn is of a rustic character, but extremely well ordered.

Having thus insured due refreshment after the excitement of the Panshanger pictures, we retrace our steps to the lodge. The road is by a wood side for about three quarters of a mile, on high ground, overlooking pastures, through which the little river Maran meanders, and the views backwards on the village, with its church shooting above the trees, are most pleasant, and suggestive of national associations. About an equal distance of road across the park leads us to the house—not the house as built by Lord Chancellor Cowper, but a modernized structure of the Wyatt class, which may be described in a sentence, as a stuccoed jumble of gothic parts,—pointed windows with modern light sash-frames—square-headed windows, battlements, pinnacles, crockets, &c.—an assemblage of parts from buildings of different ages and different purposes, brought together without much reference to use or beauty. Of course everything is very trim and orderly, and in the bright sunshine on the terraced walks, surrounded by gently undulating lawns, the defects of the architecture pass comparatively unobserved.

From the entrance hall the visitor is at once conducted into the ante-chamber of the picture gallery, the two being open to each other through Ionic pillars. The ante-chamber is dark and gloomy, the picture gallery a blaze of brightness and rich colouring, enhanced greatly by the contrast. Direct before you, as the door opens, hangs the Fra Bartolomeo, seen under a flood of light in its greatest glory. The first impression of this scene is one not easily forgotten, for its singularly bright splendour. Again and again, as you wander about the gallery, you are drawn into the ante-chamber to recall the first impression you received on entrance. The effect of the other paintings—the most interesting in the gallery—which are hung on either side of the Fra Bartolomeo, is scarcely less striking at this point of view. Before we speak of this focus of attraction in detail, we will glance at the pictures which adorn the other sides of the gallery—first, however, saying a few words in praise of the gallery itself. It is an oblong spacious room, lighted by three lanterns, having besides a noble bay window, which overlooks a most picturesque luxuriance of lawn, foliage, water, and distant hill. The walls are hung with scarlet, and though we might have preferred a more crimson hue, for the sake of some of the pictures, the majority do not suffer from the brightness of the scarlet, and the general effect is one of great brilliancy. The apartment is tastefully furnished—not for show merely, but substantial comfort—and abundantly supplied with ottomans, couches, easy chairs, &c., for enjoying a leisured examination of its artistic treasures. When the family are absent you are permitted to remain with the pictures as long as you please;—a great comfort, trebly enhancing the profit and pleasure of a visit; besides, in their absence, you are freed from any sense of intrusion; therefore, previously to making a pilgrimage, it is well worth instituting an inquiry by letter to the housekeeper respecting the actual residence of the family.

This collection, mostly of good pictures, was made chiefly by the grandfather of the present Earl, when he was ambassador at Florence, and excepting the two Raffaelles, its choicest works are by Florentine masters. It may be more satisfactory to enumerate the less interesting portions of the collection first. Rembrandt has a large vigorous broadly treated portrait of Marshal Turenne, on a grey prancing horse, both of the size of life. The painting is nearly ten feet square, and is thought to be the only equestrian portrait ever painted by him. The chiaroscuro of this picture is bright and very fine. There are four landscapes by Salvator Rosa—all painted with his mannered though spirited execution; but only one remarkable for any great similitude to nature. It is a sea-coast, with mountains, and a bright, clear, blue sea. Above it is a poetical landscape, by Wilson—a sunrise, with a castle on a rocky height;—but it has unfortunately become so dark as to lose much of its value. Nicholas Poussin has here a portrait of the statuary Quesnoy, called 'Il Fiamingo;' as a portrait a rare work for him, and very well drawn. In the dining-room is one of Vandyke's finest and largest paintings—the family group of John Count of Nassau, consisting of the Count, the Countess, and their four children. The painting is known by Baron's engraving of it. When the rooms are not in occupation, it is worth while asking for entrance to the library, in order to see Teniers's interior of an oil mill, with its dexterous touches of silvery light illumining the gloom; also Vansomer's dignified portrait of Lord Bacon of Verulam, and an equally fine portrait of a senator of Antwerp, ascribed to Willeborts, a Flemish painter of several altar-pieces at Antwerp, who lived in the middle of the seventeenth century, and not unworthy to rank with Rubens and Vandyke. Both these substantial portraits, it must be confessed, make Lawrence's portrait of the late Earl Cowper appear very chalky and flimsy. There is a sketch of the Romans and the Sabine women, by Vandyke, interesting only for its free and off-hand execution. Carlo Dolce is represented by a Nativity, rather suggestive of Correggio, whom he sometimes imitated—a bright, clear, and delicate picture, which provokes neither much criticism nor much interest. He has also a 'Holy Family'—figures the size of life; and a half-length animated portrait of his wife. In the library is one of the many copies of Correggio's 'Virgin and Child,' with the rabbit. A fine head of 'Christ crowned with Thorns,' by Correggio, in a glass case, has apparently formed part of a larger painting; and a 'Virgin and Child,' which hangs on the opposite side of the gallery, has been assigned to him—we should say on doubtful grounds. The 'Cupid,' assigned to Annibale Carracci, is thought by Dr. Waagen—who, in his 'Arts and Artists in England,' has noticed the most remarkable of the pictures here—to be a decided work by Domenichino. A dark and powerful picture, with figures of life size, representing the 'Return of the Prodigal Son,' owns Guercino as the painter. A good picture of three young children in costume of the sixteenth century, evidently portraits, is called a Titian, but it hangs too high for examination. Michael Angelo is libelled by a 'Dead Christ supported by Angels'—a third rate, clumsy, cool-looking picture, much injured and doctored by the picture dealers.

It will have been obvious to the reader that the preceding enumeration does not offer much that is very tempting. He may, if he please, forget them all: and, indeed, he will find, after seeing the works that are in this gallery of the Florentine Tailor's Son, of the Florentine Monk, and the "divine" Raffaelle, that his memory will not be overburthened with the recollection of them. We have, therefore, felt little inclination to dwell much upon them; and have rather reserved our space for a few works worth all the rest of the collection. But we must not omit to call attention to a capital Florentine portrait, unnamed, in the ante-gallery, not unworthy the best period of Pordenone. Andrea del Sarto has three noble portraits, together with a series of three pictures, apparently relating to the history of Joseph. These latter paintings are held in much esteem by many artists, in which we confess we do not fully participate. Without denying them some merit as compositions, and a certain freshness of positive colouring, they appear to us deficient in telling their story (Waagen confesses he could not understand two of them), without much defined expression, loose in their drawing and treatment, and somewhat mannered. Our want of appreciation of these must be excused by our admiration of Andrea's portraits, one of which is himself—"one of the finest portraits of his later period." He stands behind a table, and looks up from a letter which is before him. The face has a fine, noble, yet rather melancholy cast. By the side of this portrait is another, by the same master, of a lady clothed in a crimson dress. She, too, is behind a table. Books, one of which is a Petrarch, are lying upon it. Neither in point of beauty nor expression,

Digitized by Google

is this portrait very attractive; but it is interesting to the artist for the excellent secondary qualities of its execution. The third of Andrea's portraits is a three-quarters length of a young man in a caped coat, with his right hand hanging from his bosom, and his left resting in his girdles. There is very little positive colouring in this picture, and its powerful simplicity might teach even some of our best portrait painters a useful lesson in their department of art. In its mechanical execution, Andrea's practice, like that of most of the great painters of his time, seems the very reverse of modern practice. The highest lights, for the most part, seem to be realized by a thin glaze on the original ground. Adjoining this noble conception is one of the loveliest of Raffaelle's works, a Madonna and Child. The Virgin holds the Child seated on her lap, with his left hand taking hold of the upper part of his mother's vest. The Virgin has a modest unconscious look of the purest loveliness. The infant, though extremely beautiful, has, perhaps, too much the look of childish humour, a sort of mischievous joy. The whole picture excites far more a sense of refined beauty, than of devotion. Perfect as it is, it seems painted with no higher aim than that of realizing extreme maternal and infantine beauty. It is dated 1508, and affords an interesting specimen of the transition period of Raffaelle, when he was abandoning the strictly devotional aim of his early pictures to realize the beauty and refinement of nature for their own sakes alone. This exquisite picture is in excellent preservation, and a most useful study for its style of treatment, clear, brilliant, and powerful, but very thinly painted. Waagen says, that this picture strongly resembles, in its principal qualities—of grace, beauty and spirited handling—the Madonna from the house of Colonna, in the Museum at Berlin. There is likewise in this collection a second Madonna and Child by Raffaelle, which, in the absence of the picture already noticed, would be a great treasure, but it loses its interest somewhat in company with the other painting. In this picture, the Virgin is seated on a bench, holding the Child, who is fondly seizing his mother's neck. The Virgin, with a sort of dream-like quiet unconsciousness, looks towards the spectator. The general colouring and character of many of the parts, particularly the upper part of the Virgin's face, brings to mind Perugino, Raffaelle's master. Waagen instances this work as "probably the oldest specimen of the lighter pictures, in which glaze colours are used, a style which Raphael had adopted from Fra Bartolomeo." And now we come, in due turn, to the magnet of the collection, the Fra Bartolomeo itself: not perhaps attaining to that pictorial perfection which we find in the first-named Raffaelle, but certainly, to our mind, superior for devotional sentiment, and more precious on account of the extreme rarity of its painter's works, not only in our country but in all Europe, except in his native city, Florence. It is a Holy Family, seated near the shadow of the fans of a palm tree. The Virgin, with the Child on her lap, is seated in the centre: on her right is Joseph, and on the left an infant St. John with the cross. Some slight architectural indications are in the extreme distance, whilst nearer there are rocks and foliage charmingly introduced. It is a finely arranged composition, very brilliant and full-toned in colour, with strong and powerful shadows. Highly finished in treatment and carefully drawn, but the expression of the heads and figures generally does not partake of any very strongly marked character. The Virgin is beautiful and modest: Joseph rather thoughtful and grave: the Child unconsciously infantine and simple, and all are in a state of repose. The picture at once, and instantly, impresses you as the work of a strong man, putting forth his power in all parts—as well the most important as the most subordinate—as a work not painted for art itself, or to display any of its elements, but with a higher and venerated aim. You go from one part of the gallery to another, and anon find yourself drawn towards the Bartolomeo. Some few parts have been rather injured by cleaning, yet, on the whole, it is in a fine and perfect state. It is about five feet high and four wide. A word before leaving the picture on the life of its author, whose name was Baccio, the friend of Savonarola, student under Leonardo da Vinci, Raffaelle's master in colouring and his pupil in perspective. In the outset of his career he was the disciple of Cosimo Roselli; and residing near the gate of St. Peter, at Florence, obtained the name of Baccio della Porta. The execution of Savonarola is said to have induced him to become a Dominican monk, and to abandon his art for a time; but he resumed it, fortunately for art and our visit to Panshanger, and became known as Fra Bartolomeo di S. Marco, or Il Frate. He died before he reached his forty-ninth year, in 1517.

It is not a discordant thing, with the tone of mind to which a study of this beautiful work leads us, to proceed to enjoy the grassy slopes and terraced walks of the hills, woods, lake, and its flocks of swans immediately close to the mansion, and above all, the most majestic of oaks. At the first approach, the fine and well-balanced proportions of the noble tree, like those in a well made man, rather diminish its real size, but beneath the shadow of its huge branches it is an unparalleled specimen of size, strength, beauty, and health.

Whilst the cloth is laying for dinner at the inn at Hertingfordbury, the tourist will find it well worth while to take a look for ten minutes at the church and the very picturesque stacks of houses, with their awkward gables, dilapidated palings, and ruined pumps in the immediate neighbourhood. A familiar life painter might find a rich store of models here.

OUR WEEKLY GOSSIP.

Our few words, last week, respecting the proceedings of the French government have obtained for us some particulars respecting our own Lycian expedition. Mr. Fellows, it appears, is now on his way to Malta, whence the expedition will start in October. It will consist of 100 persons,—engineers, carpenters, masons, &c., besides an architect and artist,—(under Mr. Fellows's control, who acts gratuitously). A government steamer, the *Medea*, whose officers, having been employed before, have volunteered again, is placed at his command. They will arrive during the healthy season, and not, as was the case when the Syrian marbles were fetched away, exactly at the time when the climate became intolerable, and even the natives had deserted the banks of the Xanthus, a mistake which occurred in spite of Mr. Fellows's express warnings, that they should be *out* of the country before the month of June. Lord Aberdeen and Sir Stratford Canning have meanwhile diplomatically made all the arrangements to facilitate proceedings. The firman given to Mr. Fellows before is still in force; the local pachas are prepared to render every assistance; timber is felled in readiness to pack up all that may be acquired; and it is probable that everything worth having—on the Xanthus, at least—besides what may be discovered elsewhere, will be added to the stores in the British Museum.

The Emperor of Russia, in testimony of the services which Mr. Murchison has rendered by his geological researches in Russia, has, in addition to the decoration of St. Anne received in 1841, presented him with a vase of Hyaline quartz (Avanturine) upon a pedestal of porphyry, both extracted from the Altaic mountains, and wrought at Kolyvan, with the following inscription galvanized upon the base:—

"Gratia Imperatoris totius Rossiæ
Roderico Murchison,
Geologiæ Rossiæ Exploratori. (1843.)"

Also a plateau of watered damask steel, wrought at Stataust, in the Ural mountains, with gold ornaments in relief, representing the chief mining operations of those countries, and bearing a Russian inscription, of which the following is a translation:—

"To the geologist Murchison, in testimony of its peculiar esteem, the administration of the mines of Russia."

The following conversation, which took place in the House of Commons a few evenings ago, in Committee of Supply, we think worth extracting from the more dry financial matter, amid which it is very likely to have been overlooked by many of our readers. So far as it goes, it is, in a measure, satisfactory—a step in the right direction, though it only goes a small part of the way which has to be travelled, when the nation shall learn to give their due light and prominence to the best of her titles to greatness. The principle, however, which it recognizes, lets in the whole case; and we have great satisfaction in reporting the remarks of the Minister, in spite of their limitation. On the vote of 1,500*l.* being proposed, to defray the cost of monuments to the memory of the late Sir Sidney Smith, Lord Exmouth, and Admiral de Saumarez—

Mr. Hawes expressed a hope that the Government would avail themselves of the Royal Commission of Fine Arts for the purpose of ascertaining the best mode of erecting memorials to men distinguished in literature and science. He did not see why the military and naval professions should engross all the national monuments.

Sir R. Peel thought it very desirable that in the case of very eminent scientific men public monuments should be erected to their memory. He saw no reason why the country should pay that tribute only to distinguished naval and military men; on the contrary, it would be a great incentive to exertion in science if monuments were erected to the most eminent of her sons. He had given a good deal of consideration to this subject since it had been mentioned last year by the hon. member for Lambeth. The first difficulty which struck him was as to the place where such monuments should be erected. There was very great objection to placing them in ecclesiastical edifices, for unless the public had free access to them, no great public object would be attained. If they did not erect them in any edifice—if they erected them out of doors, it was almost necessary that they should be of bronze; then the expense would be enormous. He always hoped that there might be some portion of that great building which was now being erected for the Houses of Parliament that might be appropriated to the statues of eminent men, not merely of men of political character, but of persons distinguished in literature and science; and if he were assured that there could be any part of that edifice so appropriated, he should not have the slightest difficulty in referring the matter to the Commission which had been alluded to, and which had discharged its duty with the greatest credit to itself. But it was a Commission appointed to consider the properest method of decorating the Houses of Parliament; and if its duties were extended beyond the sphere assigned to it, the Commission might be made a general roving commission for the encouragement of the fine arts in this country. This was a matter requiring consideration, and he was not prepared at once to say that he was disposed to recommend that the Commission should undertake other duties than those which were originally contemplated for it. The site for the statues was the chief difficulty.

We expatiated a little last week upon some works by the incomparable *Hogarth*, lately discovered, and have now to direct the popular eye towards another production of his, far more important, yet not much better known amongst his "admiring countrymen." In a certain city, called Bristol, and a certain church there, called St. Mary Redcliff, behind the altar stands a certain picture, whose fame extends we believe, as far as the chancel rails, and is echoed from mouth to mouth of the pew-opener and verger every time they are dusting it—the clergyman passes it with mute admiration, the clerk turns up his eyes at it with a rapt vacancy: reader, it happens to be nothing less than Hogarth's work of highest pretensions for subject, size, and artistical treatment! Being so remarkable a performance, the churchwardens are naturally anxious to get rid of it, and to see their favourite whitewash replace it, as they are bent on the beautification of the edifice. Doubtless the parishioners, likewise, think it five hundred pities such a noble picture should remain in so obscure a position, and therefore offer it to the public, we hear, for five hundred pounds. We do ourselves deem it unsuitable to a Gothic church, and very proper, because a monument of national genius, to a National Gallery; but here comes the rub—could the gallery (so called) accommodate it? Our readers will, perhaps, recollect the apprehensions we once hinted, that were any of Paul Veronese's grandiose master-pieces—or Rubens's—Tintoretto's—Titian's—by any chance offered the nation, even as a present, it must be refused! from want of appropriate dimensions in the large garrets at Trafalgar Square, built expressly for a national pinacotheca! Whichever garret received Hogarth's altar-piece would look about as well-proportioned to it as a hencoop to a cassowary, and would have to doff its skylight, and remain a *hypæthral* garret, through all the inclemencies of our hyperborean climate, with the picture's head, like the Parthenon Minerva's, peering above the roof of its receptacle! Yet we say again, this altar-piece ought to be made national property; every acquirable work by a painter so thoroughly, racily English—his roughest, most reckless, and precipitate productions included, ought to be purchased for the National Collection, as requisite for the illustration of National Art. Whether such acquisitions are possible at present is another question: we only suggest the principle that we think should come into practice when occasion offers her forelock, and the Committee of Taste have power to seize it. We extract from our notes, taken in front of Hogarth's altar-piece, some few years ago, its characteristics: "An Ascension, with Sealing the Tomb, and Visiting the Tomb, as wings; figures heroic size;

Digitized by Google

full of expression; design easy, if not very pure; drapery bad enough; chiaroscuro feeble; High-priest commanding to seal, imperative and impressive; Angel on other wing may be pronounced fine; ordonnance un-architectural, yet by no means ignoble—elsewhere, might look grand; on the whole, picture much betters expectation." We feel little desire to cry up Hogarth as a history-painter, but malice, prejudice, and that Blatant Beast, ignorance, with its million mouths, have cried him down beneath his due level: Horace Walpole's delineation of the 'Sophonisba' is itself the veritable caricature!

The Exhibition of Art-Union prizes this year, is a shade more satisfactory than the last. Mr. C. Landseer's 'Monks of Melrose' is the 400*l.* prize; and the beautiful 'Jephtha's Daughter' of Mr. O'Neil, has found a discriminating possessor in a 300*l.* prize-holder. Among the other historical pieces may be mentioned Mr. Le Jeune's 'Griselda,' and Mr. F. R. Pickersgill's 'Florimel.' The landscapes of Mr. Allen and Mr. Tennant, the cattle pieces of Mr. Sidney Cooper, and the fantasy pictures of Mr. Woolmer, appear to have been in request. The selection of water-colour drawings is sadly below par. But we have said enough of the general bearing and tendency of these Associations, to absolve us from the necessity of remark or question on the present occasion.

The German papers announce that the King of Bavaria has determined on the decoration of the Cathedral of Spire. A beautiful font and a fine organ have already been placed in it, as also a monument to the Emperor Rudolph, of Habsburg, by Schwanthaler. The frescoes have been entrusted to the painter Johann Schraudolph. The nave is to be decorated with frescoes from the life of the Virgin Mary, and the choirs with incidents from the history of St. Stephen and St. Bernard. A bronze statue of an Amazon has recently been finished by Prof. Kisz, and placed in front of the eastern flight of steps of the museum at Berlin. Rauch is commissioned to execute a group of Hercules and the Nemean Lion for the western flight.

The Temperance Societies of Liverpool are about to erect a monument to the great apostle of their cause, Father Mathew.—One to another great philanthropist, the Abbé de l'Epée, is to be inaugurated at Versailles on the 25th of the present month.—A monument is also about to be erected in the Church of the Frari, at Venice, to the memory of Titian. The sculptor is Zandomeneghi.—The Society for erecting statues of celebrated Tuscans has recently exhibited at Florence the productions of this year, which consist of a statue of Boccaccio, by Fantacchiotti, and of Orgagna, by Bazzanti. Last year the statues were Dante, Michael Angelo, Leonardo da Vinci, and Lorenzo il Magnifico. The number of niches to be filled by the Society is twenty-eight.—The bronze statue of Rubens was last week placed upon its pedestal in the Place Verte, at Antwerp. The figure itself is 14 feet high, and weighs 20,000 lb. The whole monument rises to 30 feet. The inauguration was celebrated with music from the bands of the regiments quartered in the garrison, and the amateur societies of the city. At night the Place Verte was illuminated.

A Society has been formed in Germany in honour of Tiedge, the poet, which has for its objects—the assigning of a prize of 100 ducats every five years to "the poem which shall most further the highest interests of humanity"; and the assistance of poor poets, painters, sculptors, and musicians. An Album is to be published in aid of the funds, to which the best German poets of the day are to be contributors.

On the 8th of June last, being the anniversary of the death of the antiquarian, Winckelmann, the Archæological Museum of Trieste was formally opened to the public. A mass, for the soul of the deceased, was sung in the Cathedral of St. Justus, and Dr. Kandler delivered an oration on his life and works.

The Paris papers announce the death, in that capital, at the age of 88 years, of the Marquis de Fortia d'Urban, a member of the Academy, author or editor of a great variety of works, and one of the most conspicuous amongst those men of fortune who employ their wealth in the interest of letters. His library, of forty thousand volumes, was, it is said, accessible to all studious men.

A new work has recently appeared at Berlin, by Goethe's well known child correspondent, Bettina. It bears the singular title, 'Dieses Buch gehört dem König'—'This Book belongs to the King.' It appears to consist of anecdotes and reminiscences, said to be related by Goethe's mother, but which, probably, are more or less imaginary; and of a plea for the poor of a district, which the lady has lately visited.

Letters from Cork give us some particulars of the preparations for the Meeting of the British Association, and the names of such members as had already arrived, but they contain nothing of interest. An outline of the arrangements we heretofore published, and next week we shall report proceedings.

Closing of the present Exhibition.

BRITISH INSTITUTION, PALL MALL.

The Gallery is OPEN DAILY, from Ten in the Morning until Six in the Evening, with one Room containing the Works of Sir Joshua Reynolds, the next those of Ancient Masters, and the third with those of Deceased British Artists, and will be CLOSED on Saturday, the 26th inst.—Admission, 1*s.*; Catalogue, 1*s.*

WILLIAM BARNARD, Keeper.

DIORAMA, REGENT'S PARK.

NOW OPEN, with a NEW EXHIBITION, representing the CATHEDRAL of NOTRE DAME at Paris, with effects of Sunset and Moonlight, painted by M. REMOUX, and the BASILICA of ST. PAUL, near Rome, before and after its destruction by Fire, painted by M. BOUTON. Open from Ten till Six.—N.B. A GRAND MACHINE ORGAN has been constructed expressly for this Exhibition, by Messrs. Gray and Davison, of the New-road, and will perform the Gloria, from Haydn's Service, No. 1, during the midnight effect of the Cathedral of Notre Dame.

ROYAL POLYTECHNIC INSTITUTION.

CARTOONS of RAPHAEL.—The Series of ORIGINAL CRAYON DRAWINGS (by Holloway) which were executed for the well-known ENGRAVINGS of these CARTOONS, are now exhibiting, with other additions to the numerous works, both in Art and Science, in this Institution. The LECTURES of Dr. RYAN, Professor BACHHOFFNER, and Mr. GODDARD, are at Twelve, Two, a Quarter to Three, and Five, daily, and at Eight o'Clock in the Evenings. In these Lectures AGRICULTURAL CHEMISTRY and every recent Scientific Discovery is explained in a most popular manner. The COLOSSAL ELECTRICAL MACHINE, NEW MICROSCOPE (by Cary), DISSOLVING VIEWS, DIVER and DIVING BELL, &c. &c. ROBINSON'S DRYING MACHINE in operation daily.—Open Mornings and Evenings, except Saturday Evening. Admission, One Shilling. Schools, Half-price.

MUSIC AND THE DRAMA

HER MAJESTY'S THEATRE.—The season, now closed, has been one of the most gninful, the least enterprising and the least expensive in our experience: the management, as it is understood, having covered its losses of last year, with a handsome surplus. As our last assertion may startle our readers, we would remind them that Fornasari was engaged on easier terms than Tamburini, Mario than Rubini, Brambilla than Viardot Garcia: how much the management has gained, spring after spring, by the gradual introduction of stalls—the shortening of the subscription nights, and the steady advance of prices, it is needless to calculate. That the season has been so popular, may be ascribed to the good nature of the public, to its contrast with the season of 1842, and to the attractiveness of the ballet. Notwithstanding the zeal and artistic finish of Persiani, and the brilliancy and archness of Grisi, neither of the new operas has been a *court card*—while the hackneyed ones, revived for Fornasari, could only be preferred to former performances by that Curiosity which would rather have any new artist than the best old favourite. But it is fruitless to rail, to hope, or to counsel: so long as the amusement provided is satisfactory to the audience—and so long as Grisi and Persiani sing as they have sung this year, and Brambilla works her pleasant marvels without a voice, and Lablache continues his series of musical personations, the Italian Opera will always continue a pleasant—yet more, a profitable resort to all who are curious in vocal music. The pantomime of Mdlle. Fanny Elssler, too, is worthy of consideration and analysis, even by those who have not graduated in *pas* and *battemens*, and who consider a *ballet* but a tawdry display of ingenuity misapplied. Would that some new composer, or some new artist of power and originality would appear on the horizon before we again take pen in hand to write of the song and spectacle of our best-frequented theatre!

PRINCESS'S THEATRE.—The performance of Mr. Balfe's 'Geraldine,' a translation of 'Le Puits d'Amour,' produced in April at Paris with good success, claimed more than ordinary attention. The opera, though not of home manufacture, is the work of a countryman; and the drama calls for powers on the part of those employed in it, which until of late it would have been idle to expect. Since, indeed, M. Scribe made a brilliant hit with his opera of "*the cloak and sword*" school—'Le Domino Noir'—he seems to have increased the complication of his intrigue in each successive *libretto*. The one in question (for which M. Leuven is in part answerable) reminds us of nothing so much as one of those carved ivory balls, of Celestial origin, so puzzling to the young: trick within trick—mystery within mystery—equivoque behind equivoque—till the complication becomes distracting rather than effective. Let us not omit, however, to point out the admirable mastery with which M. Scribe throws incident and suspense into the forms demanded by the musician; the concerted pieces of 'Geraldine' are a study for every dramatist addicted to opera. After what has been said, the reader will not expect us to give in full the story of 'Geraldine;' enough if we merely point out one or two of its leading features. A beautiful maiden (Madame E. Garcia), cousin to a city Sheriff (Mr. P. Bedford), loves *Lord Salisbury* (Mr. Barker), favourite to *King Edward the Third* (Mr. Allen), believing her lover to be a man of low degree. He, commanded by his sovereign, in conformity with royal example, to reform and marry, sends *Geraldine* tidings of his death, by *Tresilian* (Mrs. Grattan), a rakish court page: whereupon the forlorn damsel leaps into "the Lover's Well," a fountain of very bad repute in London, with a hundred strange legends belonging to it; none, however, so strange as the truth;—the well being merely a sort of *vampire trap*, communicating with a subterraneous pleasure house of the King's, (!) by which he tries the courage of his comrades previous to admitting them to his secret joviality. Briefly, then, *Geraldine* falls into the merry monarch's arms, and, believing herself dead, the brotherhood humour her delusion to a point which menaces peril,—when *Salisbury* avails himself of a counterplot, to let loose the Sheriff upon them,—thus delivering the maiden, and consigning the monarch to one of his own gaols. How, in the third act, the King escapes, and turns the tables upon the courtier, by availing himself of a deception practised by Salisbury upon *Princess Philippine* (Miss Turpin), for the purpose of engaging her protection for *Geraldine;* and how, finally, the tables are *re*-turned, "every man having his mare again, and all going well,"—are matters too intricate to be here unravelled. We have to commend Mr. Balfe's music to this wonderful story very highly,—bearing always in mind the French audience, artists, and text, for which it was written. Portions of it are very piquant—instance the duet 'Think a sailor so faithful,' the rondo 'Roving abroad in the night,' the concerted scene in the well, and the ballad 'O thou rarest work of Nature,' in the second act, and the quintett in the third act. *Salisbury's* romance, in the first act, is a graceful melody, a *quasi* French attempt at the English style, as is also the *cabaletta* in the first *finale*. The latter, however, is misplaced, being a cheerful tune for what is meant to be a tragical situation. The overture is poor and patchy; but the general treatment of the orchestra is ingenious, as is also the combination of the chorus with the *solo* voices. There is more care in finish than is usual with the composer, save and except his 'Keolanthe,' which we still prefer, as a whole, to any other of his operas. We must insist, however, that 'Geraldine' has not here the chance which 'Keolanthe' had. The performance was very bad; only two of the *corps* (Miss Turpin and Mr. Allen) having possession of the words of their parts. Mr. Bedford raised a laugh, it is true, by the flowers of Adelphi humour, with which he besprinkled his speeches, but to us nothing could be more offensive; and he can no longer sing. Then, Mr. Barker's melo-dramatic irony and pathos—things "to dream of, not to tell,"—made poor amends for his want of memory. In an opera like this, neatness in rejoinder, and exactitude in stage business, are required to make the story intelligible. Madame Garcia, as a foreigner, may be excused for occasionally faltering in a task so heavy as the delivery of such a quantity of spoken English dialogue. She was always ready—sometimes brilliant in the music; but it was written for the bird-like voice of Madame Thillon, and an inevitable heaviness of effect arose from its being entrusted to one whose *forte* is passion, and whose voice, however urged, *must* remain tough and reluctant. The best singing of the evening was from Mr. Allen, who took Chollet's part. In a small theatre, this gentleman is our best tenor; however, the least forcing of his voice makes it painful and unpleasing. We are glad to see, too, that his schooling under the Drury Lane

Digitized by Google

management has had its influence; he walks the stage with ease and self-possession, and delivers his text like one who understands it. We wish more of the fraternity would follow his good example.

MISCELLANEA

Paris Academy of Sciences.—July 31.—A paper was read by M. Marchal, on the process of embalmment, called *le procédé Gannal*, and which consists in the injection of a liquid into the arteries of the corpse by the carotid artery. M. Marchal enters into a history of embalmment by the old processes of immersion or incision, showing the superiority of the former, and mentioning, as one instance of that superiority, that the body of Louis XIV., which was embalmed, with aromatic powders, by incision into all the cavities, was found in a state of liquid putrefaction; whereas, the body of Louis XV., which was simply covered with salt, remained in a perfect state of preservation. M. Marchal, however, appears to consider the process of embalming by injection to be the best of the three; he disputes the right of M. Gannal to the exclusive privilege of the process by patent; and as a proof that the process of embalmment by injection was known and published two years before M. Gannal took out his patent, he quotes the following passage from a paper in the *Gazette des Hôpitaux*, of July, 1835, on the use of arsenic for the preservation of bodies. "The whole operation," says this paper, "consists in the injection into the left carotid artery, by means of a syringe, of a solution of arsenic," &c. The utmost protection that M. Gannal can fairly claim (says M. Marchal) is for the peculiar compound which he employs as an injection; he has no right to a patent for the simple principle of embalming by injection, and any man who uses a different solution from that employed by M. Gannal has a right in law to embalm by injection. M. Marchal might have gone much farther back than 1835, to show that the preservation of bodies by the injection of an anti-putrescent liquid into the arteries was known and practised. It is now more than half a century since this mode of preservation was recommended, and, to a certain extent, acted upon in England, for the preservation of animals killed for sea-stock, instead of the usual process of salting. The plan either did not answer, or, like many other novelties, was abandoned from prejudice and deep-rooted habit in old systems. —A paper was received and read from M. Mandl, entitled, 'Microscopic Investigations as to the nature of the tartar and mucous coverings of the tongue and teeth.' If we are to believe M. Mandl's microscope, the human mouth is a perfect cemetery, where millions of infusoriæ find their catacombs. Leuwenhöck had already told us that the human mouth was peopled with infusory animals, and that the mucous secretion on its surface served as their ocean; but it remained for M. Mandl to discover that the tartar which covers the teeth is formed of the mountains of the dead of the inhabitants of this ocean. M. Mandl knows not to what cause to attribute the origin of these microscopic animals, but has ascertained, he says, that they are most numerous in persons who live on spare diet, and that they are instantly killed by ardent spirits.—*Aug.* 7.—Paperswere read from M. Moreau de Jonnés on the causes of insanity in France.—by M. Leroy, of Copenhagen, on the component parts of atmospheric air in different places in Europe.—M. Clement presented an instrument which he calls a manometric thermometer, for measuring the temperature and tension of steam in boilers of high and low pressure, and particularly to prevent accidents by explosion. This instrument is formed of two strips, one of which is silver, and the other of platina, rolled up in a spiral form. These strips are soldered together, and one of the extremities is fixed, while the other is attached to a copper vertical rod. Owing to the difference in the dilation of platina and silver, when the temperature of the instrument varies, its upper extremity imparts a movement of rotation to the copper rod, which is communicated by means of a rack-wheel to two hands, which indicate the variation of temperature.—M. Caffin d'Orsigny communicated a note on the fattening of cattle, in which he states that every ration of food should be equal to 5 per cent. of the weight of flesh of the animal, that the residuum of oleaginous grains is one of the best aliments for fattening, and that in the fattening of calves with milk, the quantity of fat produced is in proportion to the quantity of butter contained in the milk.—A paper was received from the commander of the *Vigie*, with an account of the effects of electricity in a recent voyage. He states that his mainmast was three times struck with the electric fluid very severely, but that no damage was occasioned to the vessel, in consequence of its being provided with paratonnerres. A sailor was sent up to see what effect the electric fluid had on the paratonnerre, and as soon as he reached it, he experienced such shocks as nearly caused him to fall down, and he felt the same every time he placed his hand on the base of the paratonnerre. It had become a magnet. The same effect had been produced on every piece of iron in the vessel. The compasses too had their needles disarranged, and would no longer serve to guide the ship. Eight or ten days after, the *Vigie* met another vessel, and obtained one of her compasses, but the magnetic action communicated itself to this one, and the instrument became useless.

Windsor Castle.—I wish to call your attention to the startling fact, that the *Terrace Walk*, on the north side of Windsor Castle, *the only Terrace Walk open to the public*, and one of the finest in Europe, is now made a cart road to the kitchen, for the conveyance of provisions, parcels, &c., and that an architectural abortion is being erected there, to enclose said carts, &c. while unloading! Can such things pass without especial wonder, and without rousing the just indignation of the public?—Yours, &c. AN ARTIST.

Patents in France.—An action has been brought in France by the representatives of Mr. Elkington, the proprietor of a patent for the new process of gilding by immersion in a bath of gold and alkali, against MM. Simon, Redier, and others, for piracy; and a cross action was brought by those parties, with a view of having it declared that Mr. Elkington's patent was null and void, on the ground of the process being public property. The case having come before the Cour Royale, on an appeal of one of the parties from a judgment of the Tribunal of Commerce, a series of experiments was ordered, and on Saturday last the Court, after a full and detailed report of the operators, and ocular demonstration of the process, gave judgment in favour of the representatives of Mr. Elkington, by declaring that, although the gold and alkaline bath, as used by that gentleman, had long been known as a chemical discovery, he was the first person who had applied it to the gilding of medals, and therefore his patent was good. MM. Simon, Redier, and Co. were therefore declared to have no right to use the same process, and condemned to all the costs of the suit, which are said to amount to 40,000fr.

Progress of Lotteries.—A notice, of which the following is a copy, was recently posted in the window of the Cherry Tree public-house, at Bromley, Middlesex:—"A coffin to be raffle on to morow evening, Aug. 8, 1843." The raffle came off on the evening appointed, and the winner took home the coffin, which had been made for another person, and turned out a misfit, for the double purpose of making a cupboard of it during his lifetime and a repository for his remains after death.—*Daily Papers.*

Chapel of Sablonville.—The plan is that of a Greek cross, the upper end occupied by the altar, dedicated to the Virgin. In one of the sides of the cross is the chapel dedicated to St. Ferdinand, and in the other a statue of the Duke of Orleans, in the dress of a general officer, and in the position in which he happened to be at the moment of his death. Above the head of this figure is placed an angel, kneeling as if in prayer, sculptured by the Princess Mary. The reclining figure is by M. Triquetti, after a design from the pencil of M. Ary Scheffer. On the principal front of the sarcophagus is represented France in the form of a genius in an attitude of grief, bewailing the loss which she has sustained. The French flag lies at her feet. On the walls of the chapel are the Prince's cipher. There are ten windows in the building, all adorned with stained glass, representing fourteen saints, seven at each side of the grand altar. The three circular arches of the roof are ornamented with statues of the three Apostolic virtues; Faith being placed over the entrance, Charity at the side of the Chapel of St. Ferdinand, and Hope in the part of the cross occupied by the figure of the dying prince. The chapel, in the Byzantine style, is surmounted by a stone cross. The compositions of the windows are by M. Ingrés. In front of the chapel a residence has been prepared for the officiating ecclesiastic.

To CORRESPONDENTS.—J. H.—A Subscriber—J. G.—received.

BRITANNIA LIFE ASSURANCE COMPANY, 1, Princes-street, Bank, London.

This Institution is empowered by *Special Act of Parliament*, (4 Vict. cap. 9), and is so constituted as to afford the benefits of Life Assurance in their fullest extent to Policy-Holders, and to present greater facilities and accommodation than are usually offered by other Companies. The decided superiority of its plan, and its claim to public preference and support, have been proved incontestibly, by its extraordinary and unprecedented success.

Assurances may either be effected by Parties on their own Lives, or by Parties interested therein on the Lives of others.

The effect of an Assurance on a person's own life is to create at once a property in reversion, which can by no other means be realized. Take, for instance, the case of a person at the age of thirty, who by the payment of 5*l.* 2*s.* 4*d.* to the Britannia Life Assurance Company, can become at once possessed of a bequeathable property, amounting to 1000*l.*, subject only to the condition of his continuing the same payment quarterly during the remainder of his life,—a condition which may be fulfilled by the mere saving of EIGHT SHILLINGS weekly in his expenditure. Thus, by the exertion of a very slight degree of economy —such, indeed, as can scarcely be felt as an inconvenience, he may at once realize a capital of 1000*l.*, which he can bequeath or dispose of in any way he may think proper.

Detailed Prospectuses, and every requisite information as to the mode of effecting Assurances, may be obtained at the Office.

PETER MORRISON, Resident Director.

A Board of Directors attend daily at 2 o'clock, for the dispatch of business.

ARGUS LIFE ASSURANCE COMPANY,
39, Throgmorton-street, Bank.

Empowered by special Act of Parliament, 5 & 6 Will. IV. c. 76.

Thomas Farncomb, Esq. Alderman, *Chairman*.
William Leaf, Esq. *Deputy-Chairman*.

William Banbury, Esq.	Rupert Ingleby, Esq.
Edward Bates, Esq.	Thomas Kelly, Esq. Ald.
Thomas Camplin, Esq.	Jeremiah Pilcher, Esq. Sheriff
James Clift, Esq.	of London and Middlesex
Rt. Hon. J. Humphery, M.P.	Lewis Pocock, Esq.
Lord Mayor of London	

Physician—Dr. Jeaffreson, 2, Finsbury-square.
Surgeon—W. Coulson, Esq. 2, Frederick's-place, Old Jewry.
Consulting Actuary—Professor Hall, of King's College.

Advantages of the Argus Life Assurance Company.
Low Rates of Premiums.

In addition to the subscribed Capital of 300,000*l.* the assured have the security of the Company's Income of nearly 60,000*l.* per annum, yearly increasing, and an accumulating Assurance Fund invested in Government and other available Securities, of considerably larger amount than the estimated liabilities of the Company.

The Rates of Premium are reduced to the lowest scale compatible with the safety of the Assured and the stability of the Company, thereby, in effect, giving to every policy-holder an immediate and certain bonus without risk, in lieu of the deferred and frequently delusive prospect of a periodical division of profits.

Annual Premium to Assure £100.

Age.	For One Year.	For Seven Years.	Whole Term.
20	£0 17 8	£0 19 1	£1 11 10
30	1 1 8	1 2 7	2 0 7
40	1 5 0	1 6 9	2 14 10
50	1 14 1	1 19 10	4 0 11
60	3 2 4	3 17 0	6 0 10

One-third of whole-term Premiums may remain unpaid at 5 per cent. comp. int. as a debt upon the Policy for life, or may be paid off at any time without notice.

In Assurances for advances of money, as security for debts, or as a provision for a family, when the least present outlay is desirable, the varied and comprehensive Tables of the Argus Office will be found to be particularly favourable to the assured.

A Board of Directors, with the Medical Officers, attend daily, at a quarter before 2 o'clock.

EDWARD BATES, Resident Director.

A Liberal Commission to Solicitors and Agents.

FREEMASONS' and GENERAL LIFE ASSURANCE COMPANY, 11, Waterloo-place, Pall Mall, London.

Business transacted in all the branches and for all objects of LIFE ASSURANCE, ENDOWMENTS and ANNUITIES, and to secure CONTINGENT REVERSIONS, &c. Loans granted. Information and Prospectuses furnished by

JOSEPH BERRIDGE, Secretary.

NATIONAL LOAN FUND LIFE ASSURANCE, ANNUITY, and DEFERRED ANNUITY SOCIETY, 26, Cornhill, London.—Capital, 500,000*l.*—Empowered by Parliament.

Directors—T. LAMIE MURRAY, Esq. *Chairman*.

John Elliotson, M.D. F.R.S.	George Lungley, Esq.
John Griffith Frith, Esq.	John Rawson, Esq.
H. Gordon, Esq.	Clement Tabor, Esq.

Joseph Thompson, Esq.

Auditors—Prof. Wheatstone, F.R.S.; Prof. Graves, A.M. F.R.S.

Actuary—W. S. B. Woolhouse, Esq. F.R.A.S.

The superior advantages to those Assured with this Society will be best understood by a comparison of its principles and a reference to the last Annual Bonus declared on Policies of five years' standing, viz.:

Entry	Policy No.	Age	Sum	Annual Premium.	Bonus added.	Cash Bonus.	Premium reduced.
			£	£ s. d.	£ s. d.	£ s. d.	£ s. d.
1837	39	59	1000	67 8 4	132 14 6	58 19 9	8 19 4
1838	114	56	3000	175 15 0	296 9 7	123 0 6	16 9 7

Policies now entered upon entitled to participation in next Annual Division. Two-thirds of all premiums paid can be borrowed by the assured without loss of Policy.

F. FERGUSON CAMROUX, Secretary.

ANNUITIES.—In the **AUSTRALASIAN COLONIAL AND GENERAL LIFE ASSURANCE AND ANNUITY COMPANY**, Annuitants *participate in the profits of the Company*, and receive a rate of ANNUITY much more favourable than can be granted by any Company making its investments wholly in England. The Company is enabled securely to grant these favourable terms from the advantage it possesses of investing a portion of its funds at a high rate of interest.

Directors.

Edward Barnard, Esq. F.R.S.	C. E. Mangles, Esq.
Henry Buckle, Esq.	J. B. Montefiore, Esq.
John Henry Capper, Esq.	Richard Onslow, Esq.
Gideon Colquhoun, Esq.	William Walker, Esq.

Bankers—The Union Bank of London.

Colonial Bankers—The Bank of Australasia, (incorporated by Royal Charter, 1835,) No. 2, Moorgate-street.

Solicitors—Messrs. Swain, Stevens & Co.

Physician—Dr. Fraser, 62, Guildford-street.

Prospectuses, with Tables, Forms of Proposal for the purchase of an Annuity or for making an Assurance, and every information, may be obtained by application at the Office of the Company, No. 126, Bishopsgate-street, City.

EDWARD RYLEY, Sec.

WESTERN LIFE ASSURANCE SOCIETY, 49, Parliament-street, Westminster.—Capital 500,000*l.*

Directors.

Henry Edgeworth Bicknell, Esq.	John Arscott Lethbridge, Esq.
William Cabel, Esq.	Edmund Lucas, Esq.
Thos. Somers Cocks, jun. Esq.	George Kennet Pollock, Esq.
George Henry Drew, Esq.	James Lys Seager, Esq.
William Evans, Esq.	John Bazley White, Esq.
William Freeman, Esq.	Joseph Carter Wood, Esq.
Francis Fuller, Esq.	Henry Wrench, Esq.
James Hunt, Esq.	

Physician—William Richard Basham, M.D.

Surgeons—Alfred Leggatt, Esq.; George D. Pollock, Esq.

Bankers—Messrs. Cocks, Biddulph & Co.

Solicitors—Messrs. J. L. Bicknell and J. C. Lethbridge.

The leading features of this Society are—

The very moderate Rate of Premium when viewed as combined with *perfect security* to the assured.

The advantage to the Assurers (by Table 2) of becoming entitled to *three-fourths* of the *profits*.

The assurance of a *certain bonus*.

The facility for *securing debts*.

The allowance of *half* the Annual Premium to remain unpaid for *seven years*, and

The accommodation of *temporary loans* to the Assured on available security. Immediate and deferred Annuities are granted by this Society on terms advantageous to the Public.

A liberal Commission allowed to Professional Gentlemen and Agents introducing business to the Office.

EDWARD T. RICHARDSON, Secretary.

VICTORIA LIFE ASSURANCE COMPANY.

Trustees.

Sir Jas. Duke, Ald. M.P. *Chairman*	Benj. Hawes, Esq. *Dep. Chairman*
Benj. Barnard, Esq.	Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus:—

Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.

Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.

Assurances may be effected *with* or *without* profits—on an ascending or descending scale, or for short periods.

Advances made to Assurers on real or undoubted personal security, for terms not exceeding three years, repayable by instalments.

Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary. WILLIAM RATRAY, Actuary and Secretary.

SUN LIFE ASSURANCE SOCIETY, LONDON.

Managers.

Charles Pole, Esq. *Chairman.*

William Burnie, Esq. *Deputy Chairman.*

Charles Boulton, Esq.	H. Francis Shaw Lefevre, Esq.

Edward Harman, Esq.	Henry Stuart, Esq. M.P.
Joseph Hoare, Esq.	Claude George Thornton, Esq.
Felix Ladbroke, Esq.	George Smith Thornton, Esq.

JOSHUA MILNE, *Actuary.*

LOW RATES.—PARTICIPATION IN PROFITS.

THE MANAGERS OF THE SUN LIFE OFFICE beg leave to inform the public that their Rates, on Young Lives, are much lower than those of many other Offices, and that the Assured are entitled to a participation in the Profits of this Society.—Persons having Life Interests, such as Clergymen, Medical Men, and others deriving Incomes from their Professions or Trades, also those holding Estates on Lives, will see the advantage of effecting Insurances in the Sun Life Office.

Tables of Rates may be had at the Sun Life Office, in Cornhill, at the Sun Fire Office in Craig's-court, and at No. 65, Welbeck-street, Cavendish-square, London; also of any of the Agents for the Sun Fire Office.

ECONOMIC LIFE ASSURANCE SOCIETY, No. 34, Bridge-street, Blackfriars, London: established 1823. Empowered by Act of Parliament, 3 William IV.

Lower Rates of Premium than those of any other office that entitle the assured to participate in the profits.

The bonus declared in 1834 amounted upon an average to 16*l.* per cent. on the premiums then paid; and in 1839 a second bonus was awarded, amounting on the average to 31*l.* per cent. on the premiums paid during the preceding five years.

Prospectuses and other particulars may be obtained at the Office, between the hours of ten and four, or will be forwarded to persons resident in the country, on application.

CAMPBELL JAMES DOWNER, Sec.

SCOTTISH (WIDOWS' FUND) ASSURANCE SOCIETY. Constituted by Act of Parliament. Established A.D. 1815, on the principle of Mutual Contribution. Accumulated Fund invested, upwards of ONE MILLION THREE HUNDRED THOUSAND POUNDS. Annual Revenue upwards of TWO HUNDRED THOUSAND POUNDS. Amount of Capital Sums insured since the commencement of the Society, nearly SIX MILLIONS STERLING.

President—The Right Hon. the Earl of Rosebery, K.T.

Vice-Presidents.

The Marquis of Tweeddale, K.T.	The Hon. Lord Moncreiff
Sir Thomas Dick Lauder, Bart.	His Grace the Duke of Buccleuch, K.G.

Trustees.

Alexander Colvin, Esq.	Joshua Walker, Esq.
Edward Lee, Esq.	

Major Willock, K.L.S.

CAPITAL 500,000*l.*

The objects of Life Assurance may be accomplished at this Office on terms as low as is consistent with security.

Examples of Life Assurance for 100*l.*

Age.	30	40	50	60
	£. s. d.	£. s. d.	£. s. d.	£. s. d.
Annual Premium..	2 4 7	3 0 3	4 4 9	6 2 5

Endowments for future and existing children, and Annuities of all kinds are granted by this Society.

The usual commission allowed to Solicitors and others, and 5*l.* per cent. extra on the first premium.

JOHN CAZENOVE, Secretary.

STONE-COLOURED CEMENT.

FELIX AUSTIN, of the New Road, Regent's Park, begs to inform Architects, Builders, Plasterers, &c. that during the process of manufacturing a very superior composition which has greatly improved his well-known Artificial Stone Ornaments, he has succeeded in making an excellent STONE-COLOURED CEMENT, adapted to building, more especially for facing brick walls and repairing decayed stone work, which he can supply at 2*s.* 6*d.* per bushel, at his Manufactory, near the Thames Tunnel, Rotherhithe.

GROWTH OF PLANTS.

HUMPHREYS'S INODOROUS SOLUBLE COMPOUND, to PROMOTE the GROWTH of PLANTS.—Dissolved in water, this valuable preparation may be used with great advantage either in the drawing-room or in the conservatory. A single bottle is equal in fertilizing force to some hundred weight of rich compost; and by its use, not only common plants are improved by increased brilliancy of flower and deeper verdure, but valuable exotics are so strengthened, as to resist the usual alternations of temperature, and may be preserved without a greenhouse.—Sold in bottles, 1*s.* 9*d.* each, with full instructions for use, by the leading Chemists, Druggists, &c. in Town and Country. Wholesale Agents, DAVY, MACKMURDO & Co. 100, Upper Thames-street, London.

WATCHES by WEBSTER & SON, Chronometer Makers to the Lords of the Admiralty (Established 132 years), 3, BIRCHIN-LANE. The largest assortment of fine Second-hand Watches of any house in London, by the most eminent makers—many nearly equal to new, and at little above half their original cost, all of which W. & Son warrant. They consist of fine Repeaters, Duplex, Lever, and Horizontal Escapements, all of superior manufacture. New Watches of the most elegant patterns upon the principle of their Chronometers, to which the Government awarded the prizes three years in succession, with compensation balances to counteract the variations of temperature. Also a large assortment of Lever and elegant Horizontal Watches, for Ladies and Gentlemen, at considerably reduced prices. Old Watches taken in exchange. The most experienced workmen are employed on the premises in the repairing department.

Webster & Son, 3, Birchin-lane, Cornhill.

BUTTER MADE IN TEN MINUTES, by the NEWLY-INVENTED CHURN, registered according to Act of Parliament.

ATTWOOD, WIMBLE & WARNER, Manufacturers, LEWES, Sussex.

This CHURN being made entirely of Block Tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which insures the butter coming in ten or twelve minutes. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use.

Sizes,	No. 1,	2,	and 3.
Churn from	7 to 8 lbs.	13 to 15 lbs.	26 to 28 lbs.
Price, carriage paid to London,	25*s.*	35*s.*	42*s.*

Metal Pans for Churns to stand in, 4*s.* 6*d.*, 6*s.*, and 7*s.* Larger sizes made to order. N.B. Thermometers and Butter Prints supplied. May be obtained through any respectable ironmonger in Town or Country, and from the Manufacturer, Lewes.

To be seen in London, at Wright's Range Warehouse, No. 3, Arthur-street, near the Monument; W. Baily & Son, Furnishing Ironmongers, 71, Gracechurch-street; Livermore & Son, Ironmongers, No. 30, Oxford-street; Benham, 19, Wigmore-street, Cavendish-square. Export Agents, Barnes & Co., 109, Fenchurch-street.

OLD GILDING, LACKER, and BRONZE, however dirty, faded, or tarnished, rendered equal to new by UPTON'S PARISIAN DETERGENTS. The effect is sudden, astonishing, and lasting; trouble merely sponging the surface, and the expense only a few pence for the largest gilt frame, and the merest trifle for lackered articles. Fly spots are at once removed; no necessity, therefore, to cover from the fly. Gold detergent, 2*s.* 6*d.* per bottle; lacker and bronze, 1*s.* 6*d.*; lamp, 1*s.* 4*d.* All are innoxious and inoffensive. Sold by Upton & Co., Lamp-manufacturers, 33, George-street, Hanover-square, and 65, Basinghall-street, City. Established nearly 40 years. A trial allowed free of all charge. Trade supplied.

ELECTRO-PLATED and GILT ARTICLES.—ELKINGTON & CO., Patentees, beg to announce that, to meet the increasing demand for this manufacture, they have opened an Establishment at No. 22, REGENT-STREET, (CORNER of JERMYN-STREET,) where every variety of articles for the Side-board, Dinner, Dessert, and Breakfast Tables may be inspected.

They have also a similar assortment at their City Establishment, No. 45, MOORGATE-STREET, where they have a MANUFACTORY for PLATING and GILDING, RE-PLATING and RE-GILDING ARTICLES of every description, and of ALL METALS.

With reference to articles of their manufacture, the Patentees beg to state that they differ from all goods hitherto offered as "Plated Goods" or "Substitutes for Silver," being made in the same manner as SOLID SILVER, from which they cannot be known, and being also composed of a hard white metal, strongly coated with silver by the Electro process.

Silver Articles of every kind or pattern exactly copied.

Every article made by the Patentees bears their stamp (E. & Co. beneath a Crown.)

MOULD CANDLES to BURN WITHOUT SNUFFING.—KEMPTON'S PATENT.—These candles do not require snuffing; they burn longer and are cheaper than any other candle; the flame is steady and brilliant. No metallic or deleterious matter is used in the manufacture. Price 8*d.* per lb. Sold by G. E. Parish, agent for exportation, 21½, Bread-street, City, and by Slodden & Stocking, 42, High-street, Marylebone; W. Gethem, Broadley-terrace, Blandford-square; W. Evans, Italian warehouse, Greenwich; John Hawkins, grocer, High-street, Whitechapel; George Hawley, grocer, Pitfield-street, Hoxton; S. Game, Fish-street-hill; J. Pain, grocer, Bethnal-green-road; G. H. Hudson, 229, Blackfriars-road; C. H. Nicholas, 19, Bolingbroke-row, Walworth; and at the manufactory, Old Bargehouse, Christchurch, Surrey.

PERFECTLY NEW AND UNIQUE PATENT BEDSTEADS.

H. PRATT respectfully solicits the particular attention of the Nobility and Gentry furnishing, and Officers joining their regiments, to the PATENTED TAPER METALLIC DOVETAIL JOINTED BEDSTEADS, which he has made arrangements with the Patentees to introduce to their notice. It is long since so necessary and useful an improvement has been invented, and one more especially deserving their notice. The facility with which they are fixed up and taken down in a few minutes, without the use of tools—the elegant and light appearance—the firmness of construction, and the utter impossibility of annoyance from insects,—all join to render them paramount to any other ever invented. The PATENT ELASTIC SPRING BEDS, &c. and complete Fittings, supplied in plain and decorative appointments. Now on view at H. Pratt's Trunk and Military Outfit Warehouse, 123, New Bond-street.

COMPOSITION FOR WRITING WITH STEEL PENS.
STEPHENS' WRITING FLUID.

THESE COMPOSITIONS, which have so remarkably extended the use of the STEEL PEN, are brought to very great perfection, being more easy to write with, more durable, and in every respect preferable to the ordinary Ink. In warm climates they have become essential. They consist of—An INSTANTANEOUS BLACK INK—A BLUE FLUID, changing to an intense Black colour—PATENT UNCHANGEABLE BLUE FLUIDS, remaining a deep Blue colour—A SUPERIOR BLACK INK, of the common character, but more fluid—A SUPERIOR CARMINE RED for Contrast Writing—A CARBONACEOUS RECORD INK, unchangeable by any Chemical Agent—Also, a new kind of MARKING INK for Linen; and Inkholders adapted for preserving Ink from Evaporation and Dust. Bottles at 3*d.* each, convenient for writing from, are prepared, which will enable those who may wish to try either of these articles to do so at a small expense. Prepared by HENRY STEPHENS, the Inventor, 54, Stamford-street, Blackfriars-road, London; and sold by Stationers and Booksellers.—N.B. These unchangeable Blue Fluids are Patent Articles; the public are therefore cautioned against imitations, which are infringements; to sell or use which is illegal.

STEPHENS' SELECT STEEL PENS.—The utmost possible care having been bestowed upon the manufacture of these articles so as to procure the highest finish, they can be confidently recommended both for flexibility and durability.

LEA & PERRIN'S 'WORCESTERSHIRE SAUCE.' Prepared from the Recipe of a Nobleman in the County.—The above celebrated Sauce has, from the time of its introduction, been steadily progressing in public favour. Its peculiar piquancy, combined with exquisite flavour, establish it of a character unequalled in sauces. Noblemen and others, of acknowledged gout, pronounce it to be 'the only good sauce;' and for enriching gravies, or as a zest for fish, curries, steaks, game, cold meat, &c., especially unrivalled. As a rapidly-increasing inquiry is now made for it in all parts of the kingdom, the Proprietors beg to state that druggists, grocers, and others may be supplied by their agents—Messrs. Barclay & Sons, Farringdon-street; Mr. J. Harding, 59, King-street, Stepney; Messrs. Metcalfe & Co. 16, Southampton-row; and by the Wholesale Oil and Italian Warehousemen in London, upon the same terms as at their Warehouse at Worcester.—Sold retail, in half-pint bottles, at 1*s.* 6*d.*; pints, 2*s.* 6*d.*; and quarts, 5*s.* each, with the Proprietors' stamp over the cork of every bottle.

FOR BEAUTIFYING THE SKIN.—GODFREY'S EXTRACT of ELDER FLOWERS, a most fragrant perfume, and delightful cosmetic. It speedily and completely removes tan, redness, &c., and by its cooling, balsamic, and healing qualities, renders the skin soft, pliable, and free from dryness, scurf, &c., and clears it from every humour, pimple, or eruption. By its use the skin becomes, and continues, delicately clear and soft, and the complexion fair and beautiful. In shaving, it is invaluable, rendering the skin smooth and firm, and protects it from the effects of sun and dust. It is beyond all praise as a general family lotion. Sold in bottles, price 2*s.* 9*d.*, by all respectable Medicine Venders and Perfumers.

FOR GOUT, RHEUMATISM, AND RHEUMATIC GOUT.

SIMCO'S GOUT and RHEUMATIC PILLS are a certain and safe remedy; they restore tranquillity to the nerves, give tone to the stomach and strength to the whole system. No other medicine can be compared to these excellent pills, as they prevent the disorder from attacking the Stomach or Head, and have restored thousands from pain and misery, to health and comfort. Sold by A. Willoughby & Co., late B. G. Windus, 61, Bishopsgate Without, and nearly all Medicine Venders, at 1*s.* 1½*d.* or 2*s.* 9*d.* per box.

PARLEY'S TALES ABOUT ANIMALS.
In one very large vol. square 16mo. price 7s. 6d. bound in cloth,
TALES ABOUT ANIMALS, by PETER PARLEY. The Ninth Edition greatly enlarged, with upwards of 500 Woodcuts, many portraits of animals drawn from life.
Advantages of this Edition:
"The number of articles is nearly doubled: the quantity of letter-press is more than doubled, and Two Hundred new cuts have been added. Care has also been taken to make the volume accord as much as possible with its title, Tales about Animals, and to give it a tendency to inspire in the minds of the young a spirit of mercy and kindness towards the brute creation."
London: printed for Thomas Tegg, Cheapside, and may be procured of all other booksellers in the United Kingdom.

CHAS. MORRISON'S PRACTICAL BOOK-KEEPING.
Seventh edition, with valuable additions and improvements, in 1 vol. 8vo. price 8s. half-bound in calf,

August, 1843.

UNIVERSITY COLLEGE, LONDON.—JUNIOR SCHOOL. Session 1843—44. Under the Government of the Council of the College.

Head Master—THOMAS H. KEY, A.M.

The School will OPEN on MONDAY, the 25th of September. The Session is divided into three terms—viz. from the 25th of September to Christmas, from Christmas to Easter, and from Easter to the 4th of August. The yearly payment for each Pupil is 15l., of which 5l. are paid in advance each term. The hours of attendance are from a quarter-past Nine to three-quarters past Three. The afternoons of Wednesday and Saturday are devoted exclusively to Drawing.

The subjects taught (without extra charge) are Reading; Writing; the Properties of the most familiar objects, natural and artificial; the English, Latin, Greek, French, and German Languages; Ancient and Modern History, Geography, both Physical and Political; Arithmetic, and Book-keeping; the Elements of Mathematics, and of Natural Philosophy; and Drawing.

Any Pupil may omit Greek, or Latin and Greek, and devote his whole attention to the other branches of Education.

There is a general examination of the Pupils at the end of the Session, and the Prizes are then given.

The discipline of the School is maintained without corporal punishment.

A monthly report of the conduct of each Pupil is sent to his parent or guardian. Several of the Masters receive Boarders.

Further particulars may be obtained at the Office of the College.

CHAS. C. ATKINSON, Secretary to the Council.

The COLLEGE LECTURES in the Classes of the FACULTY of MEDICINE commence on the 2nd of October; those of the FACULTY of ARTS on the 16th of October.

August, 1843.

UNIVERSITY COLLEGE, LONDON.—JUNIOR SCHOOL.—Mr. W. HASELWOOD, Private Tutor and Assistant Master, RECEIVES a limited number of PUPILS from the School.

The House adjoins the playground of the University, to which (with permission of the Council) a communication has been opened for the Pupil's recreation.

Mr. Haselwood undertakes the tuition of the Pupils under his care in the subjects connected with their College reading, and in those branches of education that have an immediate reference to their future prospects in life. Each Pupil has a separate bed; and, the number being limited, a Term's notice is required prior to removal.

Further particulars may be obtained by application at Mr. Haselwood's residence, No. 20, Upper Gower-street.

GRADUATION IN ARTS, &c.—Gentlemen of liberal education and pursuits may, through the assistance of the Advertiser, obtain a Degree in any Faculty for which their previous education may have qualified them. The Exercises, amount of Fees, &c., will be communicated in answer to all letters, giving particulars of applicant's status and education.—Address (pre-paid) to M. D., at Messrs. Nock's, Booksellers, 15, Tottenham-court New-road.

DRAWING CLASSES for TRADESMEN, MECHANICS, and OTHERS. Terms 6d. for an hour's Lesson.—Mr. GANDEE, Professor of Perspective, Drawing, &c. respectfully informs his friends and the public that he has OPENED a DRAWING ACADEMY at No. 36, Bedford-street, Strand, near Charing-cross, where he intends to give LESSONS on the new and successful method of Drawing from Models. Classes will meet every Monday, Tuesday, and Thursday Evening, at 8 o'clock.—Tickets and further particulars may be obtained as above. Schools and Private Families attended on moderate terms. The large room to be let for other Classes, &c.

HANWELL COLLEGIATE SCHOOL, Middlesex. Principal, the Rev. J. A. EMERTON, M.A., Curate of Hanwell, Middlesex.—Parents and Guardians desirous of selecting a School in a healthy situation, combining the intellectual advantages of a Collegiate Course with Religious Instruction, Moral Training, and Domestic Care, may obtain Prospectuses on application to the Rev. Dr. Walmsley, Rectory, Hanwell; J. D. Macbride, Esq., D.C.L., Principal of Magdalene Hall, Oxford; or of the Principal, at the School.

CITY of LONDON SCHOOL, Milk-street, Cheapside, established by Act of Parliament, and under the superintendence of the Corporation of London. Head Master, the Rev. G. F. W. MORTIMER, D.D., of Queen's College, Oxford.—THIS SCHOOL will be RE-OPENED for the next Term (extending to Christmas) on TUESDAY, the 5th of September. The year is divided into three Terms. Fee for each Term, 2l. 15s. The general Course of Instruction includes the English, Latin, Greek, French, and German Languages, Writing, Arithmetic, Book-keeping, Geography, History, and Mathematics. Persons desirous of entering their Sons as Pupils may obtain Prospectuses of the School, containing also particulars of the Foundation, Scholarships, and Exhibitions to the Universities, which are attached to it, together with forms of application for admission, at the Secretary's Office, between the hours of Ten and Four. THOS. BREWER, Secretary.

GOVERNESS INSTITUTION, 30, Soho-square.—Mrs. HINTON respectfully informs the Nobility, Gentry, and Principals of Schools, that she can introduce highly-respectable Ladies, properly qualified to fill every department in Education. Mrs. H. is much accustomed to tuition, and having resided many years on the Continent, is familiar with the French, Italian, and German Languages.—Schools transferred and recommended in England and on the Continent.—Letters must be free.

ART-UNION OF LONDON.—The Subscribers are informed that the EXHIBITION of Prizes at the Gallery in Suffolk-street, is OPEN DAILY, from Eight till Six o'clock; and that the Rooms will be illuminated on the Evenings of Tuesday, Wednesday, Thursday, and Friday, in the ensuing week, from Seven o'clock till Ten.

GEORGE GODWIN, } Honorary
August 26, 1843. LEWIS POCOCK, } Secretaries.

NOTICE.

THE ROYAL POLYTECHNIC INSTITUTION is CLOSED for a FORTNIGHT, for the purpose of fitting up ARMSTRONG'S HYDRO-ELECTRIC MACHINE. Its new and extraordinary powers will be exhibited at the RE-OPENING, with various other NOVELTIES, on MONDAY, the 11th of September.

IMPORTANT EXTENSION OF THE DESIGNS ACT.—By the Act to amend the Designs Act just passed, which comes into operation on the 1st September next, DESIGNS for ARTICLES of UTILITY, as well as Ornamental Designs, may be PROTECTED by Registration for the whole of the three Kingdoms for three years, at a small expense. For terms and further particulars apply to Messrs. Robertson & Co., Patent and Designs Registration Agents, 166, Fleet-street, London (Mechanics' Magazine Office).

GEOLOGICAL COLLECTION, to illustrate the recent Works on Geology, and to facilitate the study of this interesting branch of Science. It contains 200 Specimens in a Mahogany Cabinet, price Five Guineas, arranged and sold by J. TENNANT, Mineralogist to Her Majesty, 149, STRAND, LONDON.

The following is an outline of the Contents:—

MINERALS, which are either the components of ROCKS, or occasionally imbedded in them:—Quartz, Agate, Calcedony, Jasper, Garnets, Zeolite, Hornblende, Augite, Asbestus, Felspar, Mica, Talc, Tourmaline, Calcareous Spar, Fluor, Seleuite, Barytes, Strontian, Salt, Sulphur, Bitumen, &c.

METALLIC ORES:—Iron, Copper, Lead, Tin, Manganese, Zinc, Antimony, Silver, Platina, Gold, &c.

ROCKS:—Granite, Gneiss, Mica-slate, Clay-slate, Porphyry, Serpentine, Sandstones, Limestones, Basalt, Lavas, &c.

FOSSILS from the Llandeilo, Carodock, Wenlock, Ludlow, Carboniferous, Lias, Oolites, Wealden, Chalk, London-clay and Crag-formations.

J. TENNANT has more extensive Collections at 10, 20, 50, to 100 guineas each, and is constantly receiving additions to his large Collection of Minerals, Fossils, and recent Shells; he also gives Private Instruction in Geological Mineralogy, at 149, STRAND.

GROWTH OF PLANTS.

HUMPHREYSS'S INODOROUS SOLUBLE COMPOUND, to PROMOTE the GROWTH of PLANTS.—Dissolved in water, this valuable preparation may be used with great advantage either in the drawing-room or in the conservatory. A single bottle is equal in fertilizing force to some hundred weight of rich compost; and by its use not only common plants are improved by increased brilliancy of flower and deeper verdure, but valuable exotics are so strengthened, as to resist the usual alternations of temperature, and may be preserved without a greenhouse.—Sold in bottles, 1s. 9d. each, with full instructions for use, by the leading Chemists, Druggists, &c. in Town and Country. Wholesale Agents, DAVY, MACKMURDO & Co. 100, Upper Thames-street, London.

Just published, and may be had Gratis,

A CATALOGUE of FLETCHER & CO.'s valuable COLLECTION of NEW and SECOND-HAND BOOKS, now on SALE, at very reduced prices, for ready money. The Stock is extensive, comprising Works in Divinity, History, Biography, Voyages and Travels, German, French, and Italian, also Classical and General Literature.

PROF. DUNBAR'S GREEK AND ENGLISH LEXICON.

A NEW GREEK-ENGLISH and ENGLISH-GREEK LEXICON, with an APPENDIX, containing Terms of Botany, Mineralogy, Natural History, &c., as used by the Greek Classical Writers. In 1 thick vol. 8vo. price 40s.

By GEORGE DUNBAR, A.M. F.R.S.E.

and Professor of Greek in the University of Edinburgh.

The APPENDIX will be found exceedingly useful, especially to the Botanist and the Natural Historian.

The following testimony to the merits of the Lexicon, by the late venerable and highly-distinguished scholar, the Marquis Wellesley, was communicated to Lord Brougham, and transmitted to the author, with his Lordship's permission to make whatever use of it he might think proper:—

"Kingston House, Knightsbridge, 17th Aug. 1841.

"My dear Lord,—I am greatly obliged to you for having permitted me to see Professor Dunbar's Greek Lexicon. It is infinitely the best work of the kind which I have ever seen. It has already been of great service to me, who, as you know, am an humble but a most ardent votary of Greek literature. It will tend more to extend the study of Greek than any work now extant. * * * (Signed) "WELLESLEY."

Edinburgh: Maclachlan, Stewart & Co.; and all Booksellers.

REVIEWS

The Works of Montaigne. Edited by W. Hazlitt. Templeman.

MONTAIGNE appeared first in an English dress in 1603. The translator was Florio, Italian and French tutor to Prince Henry, the hopeful and lamented son of James the First. The second English version was that of Charles Cotton, in 1680, dedicated to the Marquess of Halifax, and perhaps the most successful translation in the literature of any European language. The judgment of Lord Halifax has been confirmed by critical as well as public opinion. "I have till now thought wit could not be translated, and do still retain so much of that opinion that I believe it impossible, except by one whose genius cometh up to that of the author. You have the original strength of his thought, that it almost tempts a man to believe the transmigration of souls, and that his, being used to hills, is come into the moorlands, to reward us here in England for doing him more right than his country will afford him." Editions of this celebrated translation appeared in 1776 and 1811, following the French edition of Peter Coste, but frequently impairing the vigorous beauties of Cotton's style, by way of modernizing his good, old, racy, and sterling English. To avoid this heinous error, at the same time correcting the inaccuracies and carelessnesses scattered through Cotton's work, has been the object of the present editor. To the Essays are added the Travels of Montaigne through Italy, Switzerland, and Germany, now first translated by Mr. Hazlitt, and well deserving of far more attention than has been yet accorded them. Prefixed is a biographical notice, also from the editor's pen; and a collection of the critical opinions of many eminent authors, French and English, upon the writings of the great essayist.

But we are wrong to speak of *the writings* of Montaigne: we should say *Montaigne* simply, for his writings are himself; his name would be the correct title for his Essays. To use an author's name as a synonyme for the productions of his wit, is a common figure of speech; but we say that we read *Montaigne*, without a prosopopœia. Never did a writer stand in so little need of a biographer; even the talent of his own Plutarch could add but few touches to the portrait of his own exquisite and faithful drawing. If he had a preconcerted plan, it was to present us with his life. In the few graceful words prefatory to the Essays, he thus speaks of his book—"It was intended for the particular use of my relations and friends, in order that when they have lost me, which they must do, they may find here some trace of my quality and humour, and may thereby nourish a more entire and lively recollection of me." And the Essays may well be likened to a master-piece of portraiture by Rembrandt. We not only read the author, but see and hear him; nay, we converse and chat with him, almost feel the cordial grasp of his hand, and know him as if he were our own grandsire, chirping his mild philosophy by our fireside. He seems coming out of his book, as we say a portrait by a great painter appears to be stepping out of the frame. His art consists in his honesty. "Had I been born among those nations who, 'tis said, still live in the pleasant liberty of the law of nature, I assure thee I should readily have depicted myself quite naked."

A marvellous deal has been written in censure and in praise of Montaigne's "egotism";—it has given offence to many, while to many it has been, and is, the spell and fascination of his works. Let us not be numbered for a moment amongst the censors. The egotism of Montaigne is not like any other egotism in the world. What has it in common with the "*Ego et rex meus*" of Cardinal Wolsey, referred to absurdly in the Spectator, as the only instance on record of a more "violent egotism" than that of the "lively old Gascon"?* Montaigne's is the egotism of the most perfect simplicity and candour—a quality that no writer can dispense with, who sits down, as he did, to "paint himself." No man who undertakes such a work can hope to escape the imputation of some degree of vanity; he must needs expose himself to the ridicule of vulgar minds, such as that of the younger Scaliger, who said, in allusion to the Essays,—"La grande fadaise de Montaigne, qui a écrit qu'il aimoit le vin blanc:—que diable a-t-on à faire de savoir ce qu'il aime?" Yet Scaliger condescended to be so minute himself in what related to Montaigne, as to acquaint the world that "his father sold herrings"!†

The I of Montaigne is *sui generis*. It is neither the *I* doctoral, cathedral, nor magistral. A less arrogant, opiniative, dictatorial, or pugnacious pronoun, never took precedence of a verb. It is not the *I* of rude polemics, but of politest conversation: the social, well-bred, good-tempered *I*, neither springing from morbid vanity, nor wounding legitimate self-esteem—an *I* never opposed to *you*; the most inoffensive, instead of the most adversative particle in the language. There is infinitely more vanity in Pascal's *on* than in Montaigne's *je*. Pascal pretended that an honest man ought to shun the naming of himself, and even the use of the words *I* and *me*. He taught the Jansenists to denote themselves by *on*; and their works were distinguished by an affected use of that indeterminate form of expression.

The Essays of Montaigne may be compared, for one moment, (as a biography) with the Confessions of Rousseau; but how broad is the distinction between the egotisms of the two writers! The mind of Rousseau was as distempered as that of Montaigne was healthy. "My defects," says the latter, "will appear to the life, in all their native form, as far as consists with respect to the public." To borrow the words of Mr. Burke, he had no "mad confession of mad faults" to make; but if any such had stained his character, he would not have "attempted a new sort of glory by bringing hardily to light the obscure and vulgar vices which we know may sometimes be blended with eminent abilities." The editor has collected, under the word "Montaigne," in his ample index, reference to the multitudinous passages in which this charming self-biographer informs us what manner of man he was. A glance over the catalogue will show that his vanity is not exhibited in parading or fondling any very serious breaches of morality. Here is one of his confessions:—

"I have an apish, imitating quality: when I used to write verses, they evidently accused the poet I had last read. I speak another kind of language at Paris than I do at Montaigne. I swear more by imitation than humour. When I swear my own oath, 'tis only, by God—of all oaths the most direct!"

This is not an apology for swearing in general, which he reckons amongst the vices; but it is certainly an egotistical preference of his own form of oath to any other; and how characteristic is the reason he assigns—"the most direct!" He then proceeds to plume himself on his superiority in swearing to Socrates, who "swore by his dog;" and to Zeno, whose oath was "*Cappari*" (by capers)—an interjection which, he adds, "is now in use amongst the Italians." Such shabby subterfuges the honesty of Montaigne scorned.

That he exposed himself by his writings to the charge of vanity and egotism he was perfectly conscious, and if he sinned, it was with open eyes. He wants no advocate on this point; he has most ably, and we think successfully, made his own defence. Take one passage, out of many, from the Essay entitled 'Use makes Perfect':—

"Every one, as Pliny says, is a good doctor to himself, provided he be capable of looking closely into himself. This is not my doctrine, 'tis my study; and is not the lesson of another, but my own, and yet, if I communicate it, it ought not to be ill-taken. That which is of use to me may also, peradventure, be useful to another. We hear but of two or three of the ancients who have beaten this road. Not one since has followed the track: 'tis a ticklish subject, and more nice than it seems, to follow a pace so extravagant and uncertain as that of the soul; to penetrate the dark profundities of her intricate internal windings, to choose and lay hold of so many little graces and nimble motions; and a new and extraordinary undertaking that withdraws us from the common and most recommended employments of the world. 'Tis now many years since that my thoughts have had no other aim and object than myself, that I have only pried into and studied myself; or if I do now and then study any other thing, 'tis to lay it up for, and to apply it to myself. And I do not think it a fault if, as others do by much less profitable sciences, I communicate what I have learned in this matter; though I am not very well pleased with what progress I have made in it. There is no description so difficult, nor doubtless of so great utility, as that of a man's self. Custom has made all speaking of a man's self vicious, and positively forbids it, in hatred to the vanity that seems inseparably joined with the testimony men give of themselves—

In vitium ducit culpæ fuga.

I find more evil than good in this remedy."

Again he says:—

"Perhaps they mean that I should give testimony of myself by works and effects, not barely by words. I chiefly paint my thoughts, an inform subject, and incapable of operative production. The wisest and devoutest men have lived in the greatest care to avoid all discovery of works; effects would speak more of fortune than of me. They are but patterns of one particular virtue: I expose myself entire: 'tis an anatomy where, at one view, the veins, muscles, and tendons are apparent, each in its proper place."

And he adds, a little further on:—

"They fancy that to think of one's self is to be delighted with one's self; that to frequent and to converse with one's self is to be over indulgent. But this excess arises only in those who take but a superficial view of themselves, and dedicate their main inspection to their affairs; that call meditation raving and idleness, looking upon themselves as a third person only and a stranger. Because Socrates had alone digested to purpose the precept of his God 'to know himself,' and by that study was arrived at the perfection of setting himself at nought, he only was reputed worthy the title of a sage. Whoever shall so know himself, let him boldly speak out, and make himself known."

The felicity of the illustration taken from anatomy, will strike every attentive student of Montaigne. As a dissector of the inner man he stands unrivalled amongst moral philosophers. Considering that the importance of self-examination and self-knowledge is one of the most hackneyed topics of the common herd of moralists, it is impossible to help complaining that Montaigne has not been applauded as he deserves for the courage and sincerity with which he prosecuted that arduous study. On the contrary, strange to say, he has been much oftener censured as a vain, presumptuous egotist, and upbraided with the very minuteness and fidelity of his self-disclosures! There has been

* See No. 562.

† The editor assures us that this was a mere calumny of the schoolman. But what imports it whether the father of a great wit was a fishmonger or a duke? Had the father of Scaliger been an emperor, his name would be no more to-day than what it is—the name of a pedant.

Digitized by Google

too little of such egotism amongst men of the same vigour of intellect and power of exposition. The philosophy of the human mind had otherwise been more advanced.

Taking a mere superficial view of Montaigne's engaging manner of chatting, rather than discoursing, about every little trait of his character and incident of his life,—reading his works for amusement more than instruction,—one is struck with their resemblance to the prose-poetry of Horace. A life of little Flaccus might be compiled out of the vivid notices, scattered unaffectedly through the satires and epistles, just as Montaigne's biography might be written from his Essays and Travels. Horace, too, was a self-inquisitor and a self-painter; and to his freedom from the Jansenist affectation, that proscribes the *ego*, we are indebted for the chief attraction of his writings. Further than this we do not press the parallel. Although Horace was philosopher as well as poet, there is no unity of philosophic purpose in his works; the mastery of a mighty science is not their pervading object; when he confesses an infirmity, an inconsistency, a foible, or a hobby, the confession is no part of a general profound investigation of his moral nature: besides, his anatomy is never deep, his research goes no deeper than the surface; "the dark profundities of the soul's intricate internal windings" are all unknown to him.

The discursiveness of Montaigne is one of the most prominent of his many singularities. He often chooses a subject apparently only to start away from it. He writes by digression, as the Parthians fought retreating. None so delightful to accompany; none so difficult to follow. It is comparatively easy to toil after the deepest thinker keeping the straight high-road of scientific reasoning; but how keep up with an inveterate rover, whose curiosity seduces him into every thicket on the wayside, and who deserts the line of march for every "lane and alley green" that leads aside from it, he cares not whither? The most eccentric comet that scampers through the firmament pretends to have an orbit, but who can determine the path of Montaigne? Sometimes the entire essay is a digression. He devotes one, for instance, to his opinion on physic and physicians,—it is entitled 'Of the Resemblance of Children to their Parents.' We doubt if Lord Halifax is right in the conjecture that Montaigne designed to conceal the scope of his observations by the irrelevance of the titles. The vagrancy of his literary habits is explanation enough. He was just as desultory in his mode of travelling, which was an exact parallel to the rambling of his style. The secretary, by whom the first part of his Travels was recorded, tells us that "when the other gentlemen complained of his leading them dances here and there to out-of-the-way places, he would reply—that, for his part, the particular place where he happened to be was where he had intended to come; that he could not possibly diverge from his route, seeing that the only route he had laid down was to go about seeing new places." And the following, how like it is to a figurative description of his writings:—"He took such delight in travelling, that he hated the very approach to the place where he designed to stay."

But let us hear how he talks himself of his aberrations and freaks on paper. He cheerfully pleads guilty to the charge of gipsy habits, and justifies himself by the precedent of Plato. Near the close of the long essay on Vanity, he says:—

"This medley is a little from my subject: I go out of my way; but 'tis rather by licence than oversight. My fancies follow one another, but sometimes at a great distance; and look towards one another, but it is with an oblique glance. I have read a dialogue of Plato, of such a motley and fantastic composition; the beginning about love, and all the rest about rhetoric. * * The titles of my chapters do not always comprehend the whole matter; they often denote it by some marks only. I love a poetic march by leaps and skips; 'tis an art, as Plato says, light, nimble, and a little demoniacal. There are pieces in Plutarch where he forgets his theme; where the proposition of his argument is only found incidentally, and stuffed throughout with foreign matter. Do but observe his mæanders in the Demon of Socrates. Good God! how beautiful are his variations and digressions; and then, most of all, when they seem to be fortuitous and introduced for want of heed. 'Tis the indiligent reader that loses my subject, not I; there will always be found some words or other in a corner that are to the purpose, though it lie very close."

Yet with all his "mæanders" and "poetic marches by leaps and skips," with all his scorn of system and method, the Essays have a philosophical unity of idea and design; the author steadily prosecutes his enterprise, and is *qualis ab incepto*. The very nature, doubtless, of his purpose, led him into the dissolute style which he adopted, for he must follow the motions and wanderings of the mind to note and examine its phenomena; and his design being to register his observations, not to weave any theory or system out of them, in what other order could he have given them to the world than the loose array in which they were suggested to himself?

He despised and detested the barren syllogistic art, in advance of him to whom was assigned the task of sending it into everlasting exile. Gladly do we seize this opportunity of quoting a passage of fresh and glowing eloquence:—

"The most certain sign of wisdom is a perpetual cheerfulness: her state is like that of things in the regions above the moon, always clear and serene. 'Tis Baroko and Baralipton that render their disciples so dirty and ill-favoured, and not she. They do not so much as know her by hearsay. 'Tis she that calms and appeases the storms and tempests of the soul, and who teaches famines and fevers to laugh and sing. She has virtue for her end, which is not, as school-men say, situate on the summit of a steep, rugged, inaccessible precipice. Such as have approached her find it, quite the contrary, to be seated in a fair, fruitful, and flourishing plain, whence she easily discovers all things below her; but to which any one may arrive, if he know the way, through steady, green, and sweet-scented walks and avenues, by a pleasant, easy, and smooth descent, like that of the celestial arches."†

As there never was a writer more untrammelled by the formalities of vulgar logic, so there was never a thinker more free from the mischievous mania of system-building. His star belongs unquestionably to the constellation of which Bacon (a generation later) is acknowledged to be the chief and brightest luminary. An ardent admirer of the ancients, Montaigne was uninfected with the scholastic pedantries of his times. His gentlemanlike tastes, no less than the force of his understanding, preserved him from the contagion of the learned dunces round about him. With his *air du monde* and his *air cavalier* he would have been monstrously misplaced amongst the pedants who reviled him; but it was his intellectual aristocracy that set him so far above them. No trace of the frivolous disputations of the day is discoverable in the Essays; no trace of metaphysical jargon; no houses raised upon the sand; not a vestige of that dauntless dogmatism, the certain recoil of which is a no less thorough-paced infidelity. Montaigne has been justly commended for "knowing how to doubt" in an age of ignorant assurance. Fifty years before Bacon made the wise observation, that "if a man will begin with certainties, he shall end in doubts; but if he will be content to begin with doubts, he shall end in certainties," Montaigne had illustrated the maxim by his own example. It has, indeed, been questioned whether he did not only begin, but end, with doubting, upon some subjects of high moment. "The radical fault of his understanding," says Dugald Stewart, "consisted in an incapacity of forming, on disputable points, those decided and fixed opinions which can alone impart force or consistency to intellectual character." Yet how many decided opinions upon points of great importance do we not find in Montaigne! How many of those enlightened maxims of government and education, now embodied amongst what we call common-sense notions, and forming the very elements of our reasonings, and even the grounds of some of our laws and institutions, may we not trace to the pages of the gallant, gay, philosopher of Gascony! Yet Stewart is right in applying his remark to the subject of theology, and equally correct in his view of the circumstances that tended, in the days of Montaigne, to confirm instead of checking the tendency to religious scepticism. "For remedying this weakness, the religious controversies, and the civil wars recently engendered by the Reformation, were but ill calculated. The minds of the most serious men, all over Christendom, must have been then unsettled to an extraordinary degree; and where any predisposition to scepticism existed, every external circumstance must have conspired to cherish and confirm it." Montaigne, however, appears not to have died upon "the pillow of doubt," which, living, he too much relied on. The writings of the reformers, and the lessons of Buchanan, disturbed his belief, without removing its foundations; and we cannot receive the testimony of his biographers without allowing that his death-bed was that of a good Catholic. Most certainly it was "decent, calm, and silent," as he had finely said "it was the study of his life" that it should be.

The present edition furnishes an index "to the authors quoted in the Essays," and by the number of references to each author, we may estimate the respect in which Montaigne held him. Plutarch is, of course, the highest in the list; and as we find Montaigne saying "I never seriously settled myself to the reading of any book of solid learning but Plutarch and Seneca," we are prepared to find the name of the latter at the head of the next most numerous batch of quotations; yet it is not so; Cicero holds the second place, which is strange, considering the severe, but, we think, just criticism in the essay "Of Books" on Cicero's philosophical works, which Montaigne observes are "those that are most useful to my design." However, in the Epistles to Atticus he delighted, and for the following characteristic reasons: "not only because they contain a great deal of the history and the affairs of the time; but much more because I therein discover much of his own private humour; for I have a singular curiosity (as I have said elsewhere,) to pry into the souls, and the natural and true judgments of the men with whom I converse." Seneca is third in place; and next to him rank Diogenes Laertius, Plato, and Horace, almost equally. Then follow Virgil and Lucretius neck-and-neck; and after these, Ovid, Livy, and Herodotus. He valued Diogenes Laertius highly, "I am very sorry we have not a dozen Laertiuses, or that he was not further extended, or better understood." Ninety-nine quotations out of a hundred are from the writers of antiquity; but he scarcely ever pays the compliment to a modern; Dante is referred to twice; Comines,

† This beautiful image, borrowed from the Ptolemæan account of the solar system, is employed by Milton in his 'Hymn on the Nativity.'

She, crowned with olive green, came softly sliding
Down through the turning sphere.

Froissart, and Guicciardini a few times each; Politian and Rabelais only once.

The abundance of quotation in Montaigne has been a subject of much critical discussion; and a great deal of shallow observation has been founded upon this peculiarity, as if it detracted from his merits as a vigorous thinker and original writer. But the quotations of Montaigne are after a fashion of his own, and a proof of his strength not of his weakness. He borrows as rich men borrow, for convenience, not out of necessity. There is as good money in his own exchequer as any that Cicero or Seneca lends him. The passages he cites are his own genuine and spontaneous thoughts, in the words of men who thought in ancient times as he did. They are aught but the *purpurei panni* ever so delicately inwrought and fine-drawn. We recognize them as part of his own rich stuff and cloth of gold. Plutarch himself would not charge him with larceny, or Seneca cry "stop thief." The quotation comes to Montaigne; he does not go to the quotation. Though it be true that half of his immortal essays may be found *literatim* in the writings of illustrious ancients, he is the most original of authors. When he avails himself of something that has been deeply, sagaciously, or poignantly observed by the wits of old, it is not his memory we admire, but his judgment; we never exclaim how well read is Michael de Montaigne in Plato, or, he has Tully at his fingers' ends! Cicero, in fact, cited in the Essays, ceases to be Cicero, and becomes part of Montaigne himself. Not an ancient in his library could have maintained an action for the recovery of one sentence in the work. "I quote others," he says, "only in order the better to express myself." This is nothing but the truth; he never quotes for display of learning, or for sake of embellishment, or to fill up a chasm occasioned by his own sterility, or to fortify a cherished theory by the *prestige* of a Greek or Roman name. No critic has better understood or stated the difference between the quotations of a writer of genius and those of a pedant or coxcomb. The effect of the latter he has hit off in his happiest manner:—

"A case in point occurred the other day: I was reading a French book, where, after I had a long time been dragging over a great many words, so dull, so insipid, so void of all wit, or common sense, that indeed they were only words, after a long and tedious travel I came, at last, to meet with a piece that was lofty, rich, and elevated to the very clouds. Now, had I found either the declivity easy, or the ascent more sloping, there had been some excuse; but it was so perpendicular a precipice, so wholly cut off from the rest of the work, that by the first words I found myself flying into the other world, and thence discovered the vale whence I came, so deep and low that I had never since the heart to descend into it any more. If I should set out my discourses with such rich *spoils* as these, the plagiarism would too manifestly discover the imperfection of my own writing."

In the multitude of quotations, the book that appears most to resemble the Essays of Montaigne, is Burton's 'Anatomy of Melancholy': we need hardly to say that there is no other point in which the two works admit of comparison. But what can be more different from Montaigne's system of quoting than Burton's? The citations of the latter are so many proofs of a thesis; documents accumulated in support of a proposition; a stringing together of all that an eccentric pedant's diffusive reading had stowed away in the repositories of his memory, demonstrative or illustrative of some section, or "subsection" of his fantastic work.

One could linger for ever over the enchanting singularities of Montaigne. Were his works to appear in a new form every change of the moon, we should be tempted to review every edition. His cheerfulness, his good-nature, his penetrating wit, the vernal freshness of his thoughts, and negligent beauty of his language, the vigour of his common sense, the shrewdness of his literary judgments, his perfect knowledge of the philosophy of daily life, all contribute to make his Essays one of the most entertaining and profitable works in any language. Antithesis is a dangerous and often very fallacious form of expressing opinion; but may we not truly affirm of this greatest of French writers, that he is learned without an approach to pedantry, discursive without being ever prolix, polished without elaboration, instructive without being magisterial or didactic, a philosopher without the rigidity of science, a speculator without the madness of system, egotistical without vanity and without offence, an aristocrat without the *morgue* of aristocracy, a moralist without being a puritan, and a wholesale appropriator of the thoughts and sayings of others, without being guilty of a single plagiarism in all his works?

Why have the Travels of such a man been so long neglected? The present translation by Mr. Hazlitt is their first appearance in an English garb. We promise ourselves the pleasure of noticing this feature of the edition before us on another occasion. Montaigne will be found with the same radiant countenance, the same serenity of mind, the same pleasant, portable philosophy, in the mountains of the Tyrol, and amidst the arts of Italy, as in the retirement of his own chateau.

King Henry the Second: an Historical Drama. Pickering.

If respect for one who has given us a valuable and thoughtful book, could change the natures of Prose and Poetry, 'Henry the Second' would rank among the best modern dramatic chronicles, since it owns the same parentage as the 'Essays written in the Intervals of Business.' But it by no means follows that a suggestive and benevolent thinker should possess the magician's ring or the minstrel's tongue, or be either poet or dramatist; and we discover in 'King Henry the Second,' not a drama, but a dramatic poem, modelled on 'Philip van Artevelde.' Now, seeing that the tendency of all copyists is to dilute excellencies and to exaggerate peculiarities, we can hardly fancy a less satisfactory model. The suppressed passion by which the author of 'Philip van Artevelde' produces his effects, easily degenerates into coldness and indifference—the philosophical quietism with which his speakers harangue, into feeble and characterless prosiness. At least we have warrant for our apprehension in 'Henry the Second,' which contains hardly a line which, if spoken, would make the ears tingle, or the heart throb, or which, when read, encourages Fancy to scale the heights, or Meditation to go down into the deeps,—as we fear the following quotation, a scene of more than average merit, will sufficiently demonstrate:—

Open space before the Convent of Canterbury.

Enter the Archbishop *attended by a multitude of Peasants singing. The Parish Priests with their crosses in their hands come in procession. The Monks of Canterbury receive the* Archbishop *with ringing of bells, and a hymn.*

Chorus.

A sound of holier joy pervades the earth
Than bells of marriage or of birth;
He comes: our guard on earth, our guide above,
The angel-bishop of our love.

Monks.

The captains of the world against him strive,
And wicked men his fall contrive;
In vain: there floats a halo round his head
Of heavenly powers; he knows no dread.

Peasants.

His face unto the poor was ever mild,
As father to a dying child;
With tears, for wounded hearts the balm and oil,
He comforted the sons of toil.

Chorus.

A sound of holier joy pervades the earth
Than bells of marriage or of birth;
He comes: our guard on earth, our guide above,
The angel-bishop of our love.

John of Salisbury. Hark now, the hymn! they love you with the love
Their pious predecessors bore St. Anselm.

Archbishop Becket. My dirge it is that they are singing; brother,
Do not imagine that I have returned
To peace and safety: I am come to die.
But while I live, no power of holy church,
Entrusted to my care, shall ever languish.
Already have the letters of the Pope
By my contrivance reached those priests of Baal,
And in such presence too, they dare not treat them
As the petty summons to some Baron's court.
They thought to have carried off by force these letters,
And to waylay me sent De Broc; as if,
Forsooth, ecclesiastical authority
Were to be met by rapine.

John of S. Oh, my lord.
Would that you had delayed these fearful missives,
If only for a time; your enemies,
Then seeing your forbearance, might in turn
Have ceased to vex you further.

Archb. B. Brother John,
Such counsel savours more of worldly wisdom
Than quite beseems a man of thy integrity.
I loathe these compromises; well enough
For marts, and for the money-lending tribe.
If this man's love of pelf, and that man's greediness
Would drag their victims widely-different ways,
And if at last a middle line be found,
It is a gain for both; but of this be sure
There cannot be a righteous compromise
Between a man's self-interest and his duty.
To find the path of duty may be hard:
That done, nothing of choice remains, but that
With singleness of heart we keep this path.
Where it may lead to is at best a question
For idle and for curious men, but fraught
With danger if it make us for a moment
Go faltering on our way.

John of S. Think of the perils
That now beset the Church! The Pope himself
Depends on the allegiance given to him
By Louis and the King of England.

Archb. B. So, brother, it may seem to worldly eyes,
And yet if all the kings on earth fell from it,
The church would undiminished still abide.
As some great rock left bare by fickle waves,
Which knows no kind of change, but is a beacon
Only to be further seen by their receding.
It is from such forbearance as you counsel,
That worldly powers grow insolent, and dare
To trample thus upon our privileges.
For be assured, my friend, authority,
Like other things in this decaying world,
Oft perishes from desuetude alone.

John of S. All this is true, my lord; but are there not
Due times and seasons ——

Archb. B. When authority
Is suicidal if it shrinks from contest.
And such a time is this. I say at once
That if St. Peter's sword had not leapt forth,
And met King Henry boldly, never more
Would it have been a terror to the nations.
We must not yield to force or blandishment.
Only in our last conference at Freitville,
The King spoke thus, "Ah, why not do, my Lord,
What I desire, and then should I put all things
At once into your hands."—I only thought,
Who in the wilderness it was that said,
"All this will I give thee, if thou wilt fall down
And worship me"—
This Henry is a prodigy of craft,
But had he been sincere, I humbly hope
That I should not the less have been unyielding.
Not to conciliate princes, but to control them,
Was power conferred on him who occupies
The see of Rome.

John of S. Granted, my Lord, but still
If it be well to bridle great offenders,
Let mean ones go unpunished for a time,
I hope, my Lord, you are not minded still
To excommunicate Ranulph de Broc,
Nor yet his brother.

Archb. B. But, indeed, I am.
To-morrow, after service, I will do it.
For seven long years, my friend, has this De Broc,
Son of perdition that he is, despoiled
The Church, and these my faithful tenants plundered.
As for his brother Robert, it was he,
The other day, who did that cruel injury
To one of my poor, harmless sumpter-horses.
Base ruffian! had he shown his malice thus
To me, myself, mayhap I could have borne it,
But this I cannot bear. These men shall find
'Tis not the husk of me that is returned,
The man himself is here. Brother, I know,
That I may perish, but before I do,
Assuredly I will avenge the wrongs
The Church has suffered.

Throughout the drama the action is mainly carried on by stage directions—but we have found fault enough.

Natural History of New York. 4to. Part I. Wiley & Putnam.

THE volume before us, the first part of an extensive work, intended to comprise the Zoology, Botany, Mineralogy, Geology, and Palæontology of the State of New York, is devoted to Zoology, and is very copiously illustrated. It is preceded by a memoir, giving the history of the State under all aspects, political, religious, scientific, &c., brought down to the present time. This Memoir is pleasantly written, in a liberal spirit, and contains some curious and much instructive information. As there has been a great deal of discussion of late respecting the educational clauses in the Factory Bill, our readers may like to know how they manage such matters in America. The school funds in the state of New York alone consist of endowments, grants and appropriations from the State and individuals, and amount to 10,500,000 dollars, which by law are declared inviolable:—

"The chief features of the common school system, are the annual election of commissioners of common schools by the people in the several towns; the division of towns, by the school commissioners, into school districts; the election of trustees in such school districts, by the inhabitants thereof; the erection and maintenance of a school house in each district, with funds derived from the tax levied upon the inhabitants by the trustees, in pursuance of a resolution passed at an annual meeting of the inhabitants; the employment of teachers whose qualifications are approved by inspectors elected by the people; a contribution by means of taxation in each school district, of a sum equal to that apportioned to the district out of the public funds; the supplying of any deficiency in the funds necessary for the support of the schools, by the charging of tuition fees upon such parents and guardians as are of sufficient ability; the exemption of the poor from all charges for tuition fees; the maintenance of a school in each district, not less than four months in each year; the visitation and examination of schools by the inspectors, and by a deputy superintendent of common schools for the county, the latter officer being appointed by the supervisors; and a supervision and care of the entire school system of the state, by the secretary of state, who is superintendent of common schools, and to whom annual reports of the condition, progress and statistics of each school district are made by the trustees thereof; the maintenance of schools wherever necessary for the education of children of African descent; the maintenance of normal schools in the most flourishing academical institutions, for the instruction of teachers of both sexes; the publication and distribution to each school of a periodical journal, exclusively devoted to the cause of education and not of a sectarian or party character, and in which are published the laws of the state, the regulations established by the superintendent, and his decisions upon questions affecting the organization, administration and government of the schools; and a comprehensive annual report to the legislature by the superintendent, of the condition of the schools throughout the state. The whole number of school districts in the state is 10,886, in which schools are maintained during an average period of eight months in each year. The number of children instructed is 603,583. The whole amount of money expended for the payment of wages of teachers is $1,043,000."

The "school district libraries" must also be considered as an important part of the system—they have been established by law in most of the principal towns, at a cost of about half a million of dollars, and are exempt from all taxes.

The following passage contains a summary of the history of the American press:—

"The earlier newspaper press was extremely circumscribed in its scope and powers. A newspaper rarely exceeded in size half a sheet of foolscap. It was a mere compilation, often crude enough, with 'the freshest advices foreign and domestic.' How 'fresh,' the reader, in this day of railroads, steam packets, and second and third daily editions, will learn not without amusement, from the fact that sixteen years after a newspaper was established in Boston it proposed to issue a half sheet every other week; by which hazardous enterprise it was hoped that the time between the paper and the latest European news, then thirteen months, might be reduced to five. For many years the 'Boston News Letter' contained no more than two advertisements. Until the close of the revolution, no newspaper was issued oftener than once a week; but with the progress of political events, the press assumed a higher position, and put forth greater energies. * * So rapid was the increase of newspapers, that in 1810 the number of such publications in the United States amounted to three hundred and fifty-nine, of which sixty-six were printed in this state."

Upwards of 300 newspapers are now published in the State of New York alone, a hundred times the number that existed in that State at the close of the Revolution, and eight times the number of all the papers published in America at the same period.

Consuelo. By George Sand. 6 vols. Paris.

Madame Dudevant has rarely taken pen in hand without attempting to set forth in fiction some peculiar theory of Art, Religion, or Social Life. She combines all her favourite themes in the present novel: or, to speak more exactly, moiety of a novel. It is, indeed, an odd feature of these hurrying and superficial literary times, that the prolixity in fiction of the De Scuderis and Richardsons, which our fathers used to deride, should be revived. Nine volumes, for instance, are devoted to the deeds and misdeeds of the Widow Barnaby! as many to 'Les Mystères de Paris,'—that most poisonous of all the extravagancies circulated by the French periodical press—with probably as many more to come; while, in the tale before us, after having conducted 'Consuelo' to a crisis in her fate, George Sand breaks off, with the promise of a sequel in 'La Comtesse de Rudolstadt.' Nor need our authoress be dismayed by fears of such a consummation as was threatened to the English novelist, when it was rumoured that a continuation of 'Clarissa Harlowe' might be expected from the summer-house at Parson's Green:—

> Through six long volumes Clara lived
> And in the seventh expired;
> Six thousand pages travelled o'er,
> No wonder she was tired!
> Resume, O Richardson, thy pen,
> And all the other five,
> We, too, shall share our heroine's fate,
> No reader left alive!

Whether her readers sigh with sympathy, or shake their head with displeasure, few who take up 'Consuelo,' will be able to lay it down without a feeling of curiosity as to the chances still in store for the heroine of so many wonderful adventures. There is a power of description, a persuasive eloquence in Madame Dudevant's manner, which go far to reconcile us to improbabilities as flagrant as those we must now advert to.

The tale opens in that chosen home of romance and music, which no one—Byron, Schiller, Otway, Mrs. Radcliffe, Cooper, and 'Cecil' not excepted—has described with such intimate truth and vivacity as our authoress. A soured, wrinkled, conscientious, old *maestro*, the very Porpora whose *trilled fugue* makes a perennial figure in all collections of musical anecdotes, is discovered scolding the songstress of the *Scuola dei Mendicanti*, an orphan, of gipsy complexion, and mysterious origin, who has already made herself the most impossibly perfect singer that the world has ever heard. But the charm of Consuelo's character is a purity and wisdom united, yet more fabulous, under the circumstances, than her prodigious musical accomplishments. She is poor, to the point of misery, with but two friends; the one, her crabbed old pedagogue, who loves her voice, her method, and the unfashionable patience with which she receives scientific instruction for the love of art's sake: the other, a handsome, profligate, Venetian boy, (in whom, we presume, Madame Dudevant shadows forth Artistic life, in the coarse and sensual acceptation of the term,) Anzoleto, also a singer, in embryo, but as regardless of all higher aims than money and flattery, as Consuelo is humble and reverential. The two have been long betrothed: and only wait for the means to marry: the maiden being ignorant of the youth's real character, and having staked her all upon his love and protection. They make their *débuts* on the same evening, when Consuelo's talent throws her lover's into the shade. Impatient at the idea of being merely considered as an appendage, and unwilling to take the labour requisite to perfect himself, Anzoleto falls into the snares of La Corilla, a waning actress, whose popularity is also dimmed by the blaze of this new star. His infidelity becomes known to Consuelo, and goaded by this, and by the dishonourable advances of the Venetian nobleman who has brought her forward, she suddenly leaves the field clear to her unworthy lover and her rival, and, availing herself of Porpora's intervention, disappears, no one in Venice knows whither.

So far the story is probable enough: the preternatural gifts and acquirements of 'Consuelo' excepted; and managed with all Madame Dudevant's art. She is profound in her knowledge of male frivolity and selfishness. Her last novel, 'Horace,' (compared with this, an insipid and dreary story) is admirable as a study of egotism. But among the male virtues she makes but wild work, as we shall presently see.

The scene changes in a breath, from the Corte Minelli and the Teatro San Samuele to a castle in Bohemia, inhabited by a proud and ancient family of nobles. The group is drawn with great power of outline and probability of detail, one member excepted: but he, alas! is the main figure. If Anzoleto be the personification of Sense, to whose assaults the artist is exposed at every turn of his career, Albert von Rudolstadt, we presume, is intended for the *avatar* of Spirit. But in this part of her task, as on every former occasion, Madame Dudevant's philosophy is insufficient for her purpose. It would seem impossible for generosity, chastity, and devotional feeling to present themselves to her, save in preternatural forms. This tendency towards the marvellous, in one who so strangely defies every established creed, will strike many with astonishment: as if there were any other refuge for a fervid and poetical spirit, resolute in shaking itself loose from all authority: weary of destroying, yet possessing no foundation whereon to build! But Count Albert is the most bizarre of all Madame Dudevant's religious monsters! He is parcel monomaniac, parcel religionist, parcel magnetist; the inspired being whom the Orientals worship—an object of admiration, of distressful anxiety to his father, his uncle, his aunt, and the Canoness (one of Madame Dudevant's most characteristic figures). Into the midst of this family Consuelo drops as from the clouds, *Maestro* Porpora having been commissioned to send the young baroness a humble friend, able to forward her musical studies. From the moment of Consuelo's entrance, nay, before her arrival, thanks to his mesmeric foresight! she exercises a powerful influence over Count Albert. It is a strange *travestie* of the position of Sir Charles Grandison and Clementine: and the exertion which Consuelo makes to turn her power to good account, and to charm away the dark shadow from Count Albert, are as monstrous as the general conception of his character, and yet, in this, well-proportioned to their object, and therefore not altogether improbable, when taken in conjunction with the rest of the tale. But she cannot love him: with the coronet of a countess

Digitized by Google

to tempt her, she remains timid, distrustful of herself, disturbed by yearnings after her artistic career, and by memories of the faithless friend of her childhood. By a permissible novelist's trick, Anzoleto reappears on the scene just when the conflict in her mind is raging the highest, tempting what may be called the *gipsy part* of her nature. Betwixt Sense and Spirit how shall the maiden choose? Consuelo flies; her reason and respect are with him she has so vitally served; but there is an impulse which so perilously entices her towards the other who has wronged her, even while she fully admits the wrong, that she flies as the only means of salvation. There is relief in the very escape from immediate decision.

We have purposely hurried over this act of the drama, feeling, for the reasons given, its vagueness and imperfection. Leaving a word of hope, and a promise that she will search her heart closely, by way of comfort to the pale, mysterious, and high-minded count (whose delicacy to her is not without parallel in the annals of manhood and artistic life), Consuelo takes flight for Vienna, to which metropolis Porpora has been transferred in the train of the Venetian ambassador. Here, not to speak irreverently, the harlequinade of the romance begins. Not even in 'Wilhelm Meister' are the pleasures of vagabondizing painted with greater unction than by Madame Dudevant. Her heroines have the same delight in roaming for liberty's sake, as Lady Morgan's in masquerading for the good of mankind. And hardly has Consuelo gone a stone's throw from the Giant's Castle, where her artistic enthusiasm had suffered so weary an imprisonment, when chance sends her such a playfellow as never songstress was favoured with—who but Joseph Haydn! and, of course, the two sit down by the roadside, tell each other all their stories, and then set off as lovingly in company as the *tenore* and *prima donna* of an opera, expecting adventures, to meet which Consuelo equips herself in Rosalind's fashion. Of course they are not disappointed. The fourth volume of the novel before us contains some capital adventures; Consuelo and her playmate deliver a Prussian deserter from the hands of a recruiting party; they improvise a village mass, and fall in with a Canon, with royal blood in his veins, the very *beau ideal* of a musical, benevolent *bon vivant*. Perhaps the pictorial powers of our authoress were never more felicitously displayed than in the description of this dignitary's sybaritic hermitage, and his household. It is like the best Flemish painting, with a touch of fancy and elegance not belonging to the artists of the *Pays Bas*. Much as it must suffer in the process of paraphrasing, we cannot help loitering for a moment in the enchanted land:—

It was a calm and fair night, with a full moon in a cloudless sky. The clock of the old Priory was striking nine, with a clear and solemn chime, when Joseph and Consuelo, having in vain sought for a bell at the gate of the enclosure, made the circuit of the silent dwelling, in the hope of finding hospitable entertainment. It was in vain: not a dog barked; not the smallest light was to be seen in the windows of the gloomy building. "We have arrived at the palace of silence," said Joseph, gaily; "and if yonder clock had not twice announced the four quarters in *ut* and *si*, and the nine strokes of the hour in the *sol* above, I should fancy the place abandoned to owls and spirits." * * "Yet if we are compelled to sleep in some chapel," said Consuelo, "here I will pass the night. Let us try at any rate to make our way in, over the wall: it cannot be difficult to scale." No sooner said than done: the wall was a low one, and in two moments the audacious pair were walking tranquilly within the sacred precincts. It was a beautiful kitchen garden, kept with delicate care. The fruit trees, on espaliers, extended fan-wise their slim branches, loaded with crimson apples, and pears as yellow as gold. From the trellises of vines, disposed in arches, heavy bunches of the richest grapes hung like so many chandeliers. Even the luxuriant beds of vegetables had a certain beauty. The asparagus, with its silken filaments, glistening in dew, made a Lilliputian pine-forest, covered with a silver gossamer; the peas entwined themselves into slight garlands, or formed long avenues, in the shadow of which might be heard the chirping of the small bird, not wholly hushed for the night. The sunflowers, gorgeous giants of this green empire, lolled heavily their golden disks, on their ample and dusky leaves. The young artichokes, like so many young princes, were set in formal order round the great crowned head in the centre. The melons under the glasses resembled plethoric mandarins in their palanquins, and the moonshine, falling on these tiny domes, crowned each as it were with a large blue diamond, round which the moths fluttered, attracted by the glimmer. A hedge of roses formed the line of division between the kitchen garden and the parterre, the latter circling the house with a positive wreath of bloom. Magnificent flowering shrubs gave shelter and relief to a collection of the rarest and most fragrant plants. The gravel on the walks was as soft underfoot as a carpet; the turf so fine and smooth that one might have fancied that every blade of grass had been separately tended; the flowers so crowded that the earth was hidden, every bed seeming to be an overflowing basket. * * The Priory was a small building of the twelfth century, once fortified with battlements, which had now given place to steep gables of gray slate. Heavy masses of ivy broke the monotony of the walls, and the bare spaces, steeped in the moonlight, were crossed by the flitting shadows of a few young poplar-trees; the doors were festooned by the vine and the jasmine, which also peered into the windows of the mansion.

Never, surely, was a kitchen garden represented in such glowing colours, even by the rapturous imagination of a Brillat-Savarin. 'Consuelo' is full of such exquisite and minute painting. We had marked for paraphrase the interior of a theatre by daylight, the truth and strange fantasy of which would do no discredit to Hood or Hoffman, but have resigned it in favour of the scene just rendered. Capital, too, in the *false*-Watteau style, is the description of the *fêtes* given by the ridiculous *dilettante*, Count Hoditz, through which Frederick of Prussia stalks *incognito*—silent, sarcastic, and observant.

To return, however—while sojourning in this palace of dainty delights, Chance, the Fairy, enables the forgiving Consuelo to render essential service to her old rival, La Corilla, who passes that way also, on her road to the Opera of Vienna. Thither, too, we must wend, and find ourselves at once in the midst of a crowd of celebrities, headed by *King* Maria Theresa! The reader will, possibly, be curious to see in what *tones* Madame Dudevant has painted the portrait of this distinguished woman. We must premise, that on Consuelo's return, Porpora strained every nerve to revive and encourage her theatrical ambition; holding sincerely that the crown of a *prima donna* is worthier pains and patience than the coronet of a Rudolstadt; and to this end mystifying and intercepting her correspondence with the recluse Count of the Giant's Castle. But a thousand obstacles prevent the accomplishment of his wishes: among others, the scrupulosity of Maria Theresa, who had been acquainted by Consuelo's rivals with some gossip respecting the intimacy between the *cantatrice* and the symphonist in embryo, and who piqued herself—as all the world knows—upon favouring no artist whose character was otherwise than moral:—

It is known that Maria Theresa gave audience once a week to every one wishing to approach her, a hypocritically paternal custom, religiously maintained by her son, Joseph the Second, and which still flourishes at the Court of Austria. Besides this, the Empress willingly granted private audiences to those who were desirous of entering her service: never, indeed, was sovereign more easy of access. Porpora had, at last, obtained the wished-for musical audience, at which the Empress, on making a nearer acquaintance with Consuelo, might, perhaps, be prevailed upon to express a decided interest in her behalf. Thus, at least, hoped the *Maestro*. Well acquainted with Her Majesty's requisitions in the matter of good conduct and decorous behaviour, he said, within himself, that she must be struck, beyond all doubt, with the evident frankness and modesty of his pupil. They were introduced into the private apartment of the palace, where also a harpsichord had been conveyed. After half an hour's waiting the Empress arrived. She came from the reception of some personages of importance, wearing still the dress of state, such as is to be seen on the medals struck during her reign; a robe of brocade, and an imperial mantle; with the crown on her head, and a small Hungarian sabre at her side. In this costume she looked, indeed, beautiful! not as her courtiers loved to paint her, wearing an imposing air of super-human nobility; but fresh, cheerful, with an open and happy countenance; a mien confident and enterprising. It was none other than that *King* Maria Theresa whom the magnates of Hungary had proclaimed, with drawn swords, on that day of enthusiasm: but a first glance showed a good rather than a great King. She had no coquetry: the familiarity of her manners bespoke a mind at once calm and devoid of the affectations of her sex. Yet those who looked at her long, above all, if she questioned them with perseverance, might detect something of *finesse*, something even of deliberate craft, in her smiling and affable physiognomy: but the craft was masculine, imperial—never frivolous or womanish. "You shall give me a hearing of your pupil presently," said she to Porpora. * * "But I wish first a little private conversation with her. I must put several questions to her, and as I count upon her frankness, I have good hopes of being able to extend towards her the protection which she entreats." * * On finding herself alone with the mother of the Cæsars, the heroine of Germany, and the greatest woman who at that time existed in Europe, Consuelo felt neither troubled nor intimidated. Whether the carelessness of the *artiste* rendered her indifferent to the armed pomp which shone round Maria Theresa, even to her costume, whether her noble and independent spirit felt itself on a level with the highest moral greatness, she awaited with calmness the questions of Her Majesty. The empress seated herself on a sofa, played with the jewelled band which fretted her round and white shoulder, and began.

We will spare our readers the homily of the Empress, inasmuch as she imagined herself discharging maternal and moral duties in ordering the amusements of her people, while, in reality, indulging her curiosity. She had pre-arranged a scene in which Consuelo was to confess her passion for Joseph Haydn, and herself first to advise, then to encourage the same; the whole winding up with a nuptial benediction. But Consuelo was a bad courtier; had no story to tell, no pardon to entreat, and, most of all, no desire of being fitted with a husband by so despotic an arbiter of proprieties. The more the imperial querist pressed and sermonized, the sturdier became our heroine's resolution: a different group this of the queen and the subject from that exhibited by Scott in Greenwich Park, and one in the execution of which the novelist slily "feeds fat" her grudge against royalty.

"Well," burst in a subdued voice from Porpora, who had waited in the gallery shivering with cold, and writhing with anxiety and impatience—"Well! we carry the day I trust." "On the contrary, master, we fail," was the reply. "And thou sayst so calmly!" * * "Do you recollect, master," said Consuelo, "what we said of the great minister Kaunitz, when coming from the Margraves"—said? "that he was an aged gossip!—and so he has been making mischief?" "Without doubt; and I will tell you something more. Her Majesty the Empress and Queen of Hungary; she is a gossip, too!"

The sequel to this interview, was the engagement of the false and vicious Corilla, preferred by the empress on the score of character! The tale is full of like sarcasms.

Digitized by Google

In the train of Maria Theresa, figure Prince Kaunitz, Baron Trenck, Metastasio, Caffairello, &c., and *la* Tesi. We notice this last musical celebrity in particular, though she is here introduced merely in the background; because, strangely enough, to her belonged a romance, the reality of which may possibly have suggested the idea of Consuelo's delicate position with regard to the noble German family. The Tesi was sought by an Austrian count of many quarterings in his escutcheon: to whom, moreover, it is said, she was attached. His family interposed; appealing to her generosity, and representing the disastrous consequences which must ensue to an old and noble house, should its heir make so terrible a misalliance. The *prima donna* proved herself equal in pride, to those who stooped to this humiliating appeal. There was a baker, in the next street, who had long conceived a hopeless passion for the brilliant *artiste*. Him Tesi sent for, and married; to place herself, she said, irrevocably beyond the reach of injuring or of being injured.

We must content ourselves with sketching rapidly the further adventures of Consuelo. After much difficulty and intrigue, at last, partly owing to an impulse of gratitude on the part of La Corilla (whose character is admirably developed) she reappears on the stage—and, as before, eclipses every body. But, according to the perversity of nature, her very triumph disgusts her with her profession, and disposes her to think with yearning of the purer and more elevated life waiting her acceptance. She writes to this effect, to Count Albert; but Porpora—for her good—as he thinks, intercepts the letter: in the end she is recalled by express to Riesemburg—where she finds her noble lover, smit to death by her unaccountable silence, and by the withdrawal of the influence she had exercised over his disturbed brain. To gratify his entreaties, and at the solicitation of his family as a last experiment, she consents to the performance of the marriage ceremony; in the very moment of which he expires. One night his widow watches by his corpse—and the next day, is peremptorily dragged thence by the engagements of her artistic career—a virgin Countess of Rudolstadt, of whose story we are promised further tidings on a future day.

It is not difficult to explain, why we have devoted so much space to a production so wild as this novel, fuller of extravagancies than even of deep thoughts and marvellous beauties of detail. Be its views right or wrong, distorted or natural, the aim of this novel is to consider the mutual relations of art and society: and the subject is one of great and increasing interest. To reconcile "the children of fire," with the more useful and practical race of "hewers of wood and drawers of water:" to encourage a trustful reciprocation of tolerant sympathies; to preach the noble moral, that the highest art cannot be reached without the highest virtue, is a labour Madame Dudevant can never completely nor consistently accomplish, her mind having lost its purity and balance. Nevertheless, enough of what is true and noble is set forth in 'Consuelo' to engage all those who are philosophically interested in the subject; while as a romance, it is full of contrast, adventure, and interest.

The Discourses of Sir Joshua Reynolds. Illustrated by Explanatory Notes and Plates, by John Burnet, F.R.S.

[Second Notice.]

In his annotations Mr. Burnet puts forward, and foremost as he ought, one great principle—unremitted attention to Nature, the mother of artistic excellence, whose claims, forgotten sometimes but always surviving, he presses with affectionate zeal. Though a truism, and often repeated, this principle never sounds trite, because, like a great moral commonplace, it is above measure momentous; and tautology about it we consider even more than pardonable—a devoir, a positive merit, which amounts almost to a beautiful figure of speech. So the Carpathian wizard's reiterated *te, te,* has a fine tiresomeness that echoes the very sense of his expressions, and proves him a cunning poet:

> Te, dulcis conjux, te solo in littore secum,
> Te veniente die, te decedente canebat.

On the other hand, we think him (Mr. Burnet, not Proteus,) scarce respectful enough towards the father of artistic excellence,—*Art.* For let the opposite factions of naturalists and idealists cry up their separate dogmas as they will, excellence springs neither from nature nor art, but from both, from the marriage between them and their perfect incorporation, she fundamental, he predominant. Certain critics, somewhat less bigotted, admitting the banns, still keep apart those whom Heaven has joined, or at best make their conjunction resemble that of two stars when one eclipses its companion: "get thee behind me," shouts he or she, as if each were the other's evil genius instead of helpmate! Equality between them—equal indispensability—is the principle which our annotator should, we submit, have enounced, developed, justified, and sustained throughout his commentary. A painter or sculptor cannot by art alone produce artistic excellence; no more can he by nature alone; his works in the former case would be artificialities, in the latter, mimicries—servile copies of originals that a looking-glass or transparent roof would portray much better. If we want to see Nature, let us go and look at herself; why look at her through a piece of canvas or marble? You extol Mr. R. A.'s "Alehouse Door" as so natural—the very thing itself!—the clowns yawning on the benches—the chub-faced children hanging about the hatch—the two pipes laid criss-cross inside the lozenge-pane—the picturesque donkey with its long ears awry, and the cur-dog with its short ones erect—&c., &c.: Bless us! if this be all, there is a Red Bull or Green Dragon every hundred yards of high road, where we have clodpates, big and little, pipes, donkeys, dogs, &c., in abundance! what can you wish more?—these are indeed the very things themselves you seek for—natural beyond the power of Prometheus, were he an R. A., to imitate! You admire Paul Potter's "Ox" or Pickersgill's "Alderman," forsooth, because it is so like a *real* ox, a *real* alderman: pray tell us wherefore you visit a picture-collection to admire the mere semblance of either, when you need only visit Smithfield or Guildhall to behold the quadruped or biped itself? Pray tell us the use of art, when by your supposition all it should do, the omnipotent Paintress and Sculptress has done far better—explain its dignity, when your most perfect artist must be a mixture of ape and mechanical engine? Such a hypothesis once granted, the Fine Arts become contemptible as a pursuit, and idle as a pastime. Reynolds long ago raised his voice against the half-true principle of "nature and nothing but nature"; Quatremère de Quincy in his work *Sur l'Imitation* (see our analysis No. 503) dissects and denounces it; every artist should cry out trumpet-tongued at the deep degradation to his profession it implies. There are few subjects on which small philosophers and shallow enthusiasts talk so much grave nonsense. We consider it essentially an opinion of *middle-class mind*—begetting middle-class works—works reaching the various medium heights of merit, never the loftiest. Mr. Burnet, we fear, has fallen a little deeper than the eyes into this popular prejudice. Reaction from the previous extreme (love of the ultra-ideal) may have brought about the present taste, which if wholesomer, is nevertheless uncatholic also. Why paddle out of Scylla's mouth straight across into the maw of Charybdis? A plain if not very broad, a safe if rather straight passage, lies between them! *Medio tutissimus ibis.* Verily Phaeton fell from heaven in vain!

Perhaps we do our author wrong to rank him with ultra-naturalists. Was the subjoined "popular illustration" but a momentary hallucination? Criticizing a remark of Sir Joshua's (rather the letter than the spirit), he says, p. 170—"In the later works of the Greeks, the unsophisticated character of the human form seems to have guided the chisel; and had Reynolds lived to witness [see?] the Elgin Marbles, he would have acknowledged the supremacy of beautiful nature, uncontrolled by the severe line of mathematical exactness; the outline of life, which changes under every respiration, seems to have undulated under the plastic mould of Phidias; and on their arrival in England, when Gregson the boxer was stripped before Theseus, the origin of its excellence was evident to all." We shall not analyse the various other theories in this strange passage, but—Theseus an excellent statue because it resembled *Gregson the boxer!* Here is transcendental criticism! Here is the sublime poetic philosophy of sculpture! Why, then—if that were the criterion of excellence—why, then, we ask, not have taken a cast from Mr. Gregson's person *in puris naturalibus,* and so procured an additional Phidian statue? What an eternal boast and blazon about our Elgin Marbles! Wherefore not cast, man by man, the brawny, sinewy, proficients in the noble art of pugilism, or the picked rank-and-file of the Foot Guards, and, with these for models, raise a whole regiment of Elgin Marbles? What an accession to our "treasures of art!" How the pure Attic taste would be propagated! Every private gentleman might then have Greek master-pieces (or equally good, on Mr. Burnet's principle) at the price of gate-posts! We might have *Theseuses* as plentiful as King Georges and King Charleses, to adorn each square and street crossing; *Theseuses* to preside over all the London pumps, and all the spas throughout England! Then could we obtain, without trouble, busts to stick upon the headless trunks of the Parthenon divinities, besides arms, legs, &c. to suit; and thus patch up the British Museum fragments into complete figures, beautiful as Phidias's own conceptions! Ah, no! ye simple-hearted enthusiasts for nature and nothing but nature: the heights of criticism are not just like Primrose Hill, to be scaled some fine afternoon—they are little less above the common sea-level of taste, than heaven above the horizon! No, with Mr. Burnet's leave, his origin of excellence far from constituting the excellence of the Theseus, or even of a Pollux, would scarcely constitute the excellence of a King Amycus. The true origin is something very different; perhaps unknown to Mr. Burnet; certainly unknown through *his* means to his reader. Phidias, if he lived now, would never *Gregsonize* in his godlike forms, nor found the excellence of his *Athletes* themselves on their being modelled after any boxer, were he the flower of Moulsey Hurst, the pearl of the prize ring. Canova committed a most vulgar mistake when he took his classical pugilists, Creugas and Damoxenus, from Italian Gregsons.* What a flattering opinion it would give of the elegant, fine-limbed Apollo Belvidere, to tell us he was the ditto or the corrival of "Gentleman Jackson!" Alas, alas for English art if such be English artistic criticism!

* Have the Boxers of the Tribune, albeit "light weights," very much of a *Jack Randall* character? and if they had, would that form their chief merit?

Digitized by Google

We have often regretted that none of our philosopher-poets should take up and investigate the subject of Mute Poetry; a subject which they are best fitted, by congenial spirit, to expound. Practical treatises, good or bad, glut the book-shops. Admirable scientific works, both from the hands of professors and literary amateurs, may be had in less abundance. But our Wordsworths, Coleridges, and Byrons, unlike the Goethes and Lessings, leave to subordinate cultivators a province of poetical land, vast and fertile, and, moreover, an appendage of their own. Why should the Muses' first-born, perhaps favourite daughter, despise or neglect her half-sisters! It is unamiable and unnatural. Nothing, however, evinces better the low repute in which these countries hold the fine arts, maugre the extensive patronage, the sumless praises and pounds sterling lavished on them. A great poet or philosopher disdains to study them; and well he may, as (admitting all their brilliance and prettiness) they are practised here. Burke alone, when young, and when they were of a higher mood, embraced their cause: had he not afterwards—

To party given up what was meant for mankind—

namely, his genius, he would perhaps have mastered their true principles, and raised the national standard of taste by a far sounder work than his 'Sublime and Beautiful.' Nothing can better demonstrate, too, how much that vaunted interest, felt or feigned towards art, is mere matter of idle *dilettanteism* and ostentatious splendour among our aristocrats—among our middle classes of simple amusement to the eyes, or, at most, of superficial, ephemeral amusement to the mind; and not seldom, even among them, mere matter of handsome house-furnishing, family pride, or affectation, &c. We might have added, of trade, profession, and livelihood—extrinsic, though fair and respectable motives. Nothing can better evince, we say, how very distinct that interest is from real *love* and abstract taste for the arts, than the fact of their being deemed unworthy to employ thought or pen by our pre-eminent poets and humane philosophers, whilst German and French authors of the highest rank devote their highest powers to exalt what are held so estimable throughout all classes of their fellow-countrymen. Hence the state of English *æsthetics*.

Would any philosopher-poet, let us ask, allow, in the present age of criticism, one most erroneous and injurious principle to pass without due correction, namely, that "pleasure is the end of art"? Sir Joshua perhaps echoes this after his Sir Oracle—Johnson; and it must have been a pure oversight with Lessing, the spirit of whose whole treatise contradicts it (*Athen.* No. 713). We are not unreasonable enough to have expected from Mr. Burnet, who sets up neither as poet nor philosopher, but simple F.R.S., any counter-blast against such a pernicious doctrine; we only deplore the mental *malingering* which infects the ranks of our lettered men, causes the ablest among them to shirk that discipline requisite for their effectiveness as artistic critics, and makes them devolve upon sutlers and pioneers, the duties themselves ought to perform.

Mr. Burnet, however, catches by times a much clearer glimpse of Art's real excellence and end than his notion about a Greek demi-god *à la Gregson* betrays. He justly ridicules the infatuation so prevalent some years since to which Thom gave rise,—not the *Kentish*, but the *Scottish* miracle-worker—not an infatuation of ignorant fanatical hop-pickers, but of thorough-paced sightseers and fastidious townbred dilettanti—each in his or her opinion

The nose of *haut-goût* and the tip of taste.

Our author says—"Nor can we forget the lavish praise bestowed upon the figures of 'Tam o' Shanter and the Souter,' by Thom, from Burns' poem: from the prince to the peasant all classes were in raptures at the wonderful imitation of the worsted hose; to work stockings in wool was nothing, here were stockings worked in stone! The result is, however, a painful lesson to every one who attempts to take the citadel by storm, or who relies on the praise of ignorance; the pretenders to taste are now ashamed, and deny their patronage, and the sculptor has retired to that obscurity which ignorance invaded." A judicious critique: yet its pronouncer could not generalize his own principle, nor see that Theseus, the fac-simile of an English bruiser, would have been but another version of the wonderful *worsted hose!* to have been a boxer in flesh and blood was nothing, here would have been a boxer worked in stone!

Yes, there is a prodigious deal of enthusiasm extant among our countrymen and countrywomen, about many other things beside Oxford Tracts and Methodist Missions. By ill-luck most of it is wrong-headed enthusiasm—enthusiasm for the frivolous, the ephemeral, the pretty, and the petty, the common-place when servilely natural, the ideal when absurdly hyperbolic. This may, perhaps, be better than none,* but would there were a little more right-minded enthusiasm along with it! We have known persons who fell straight into the finest fits of ecstasy at seeing Herr Von Helldunkel's 'Last Judgment,' yet stood as cool as if they had been cut out of cucumber before Michaelangelo's! Some will rhapsodize the length of an Iliad about Mr. Such-a-one's "Addisonian style," yet detest Addison and all his works! or will dilate upon the "Miltonic beauties" in Mr. Prettyman's last new poem, yet feel none of those in Paradise Lost! Others will look daggers, poisoned daggers, if you question the sublime eloquence of the Rev. Mr. Cantwell's extempore prayer, while they drowse over the noblest Psalm with no more perception than a parish-clerk has that it contains aught beyond good Sunday reading! How many people (literary people) will eulogize a popular novelist as they should a Shakspeare only, and Shakspeare† as they should only a popular novelist! Delightful in truth to behold the radiant benevolence of those who hunt out shoemaker poets, and cherish aspiring stone-masons into sculptors—not because their *protégés* were obscure men of genius, but men of obscure genius,—not because they were real poets and sculptors who wanted patronage to show themselves such, but shoemakers and stone-masons whom patronage wanted to show *itself* such! Mr. Burnet, besides the "Thomists" abovesaid, specifies as an example of distempered popular taste, the much larger sect of wrongheaded enthusiasts that frequent our public galleries. Roubiliac's statue of Shakspeare, he says, and with lamentable truth, "has more admirers from its high finish and curious detail of stuffs" than Chantrey's Sir Joseph Banks, its near neighbour, at the British Museum. But exemplification might have gone a pace or two farther and fared better, for even Chantrey's Banks has more admirers from its plain, prosaic, true-to-a-pimple character, than the Theseus, its next-room neighbour. We have not a doubt—not the shadow, the dream of a shadow of a doubt—that English enthusiasm for Fine Art would prefer the full-length portrait of a master-manufacturer by Chantrey, to the Jupiter Olympius by Phidias himself! If Phidias, indeed, had sculptured, not the Parthenon Minerva, but the Velletri Minerva, the goddess of blacksmiths, she would find many sad good Christian adorers among us—they would kiss the hem of her leathern apron! Ay, or of the Turcoman god-Farrier's, were his image set up, like Nebuchadnezzar's, for national worship; they would bow down to the emblematic Horse-shoe, though they will not bend to the Cross. These are tropes we grant, but tropes are often but vehement expressions of deep-felt truths. Yet answer us: do not our compatriots in their hearts salute Mammon's hoof as reverently as ever they did the Pope's slipper, or as Romanists do St. Jupiter's brazen toe, transubstantiated into St. Peter's, at the Vatican? If yes, our most anti-Catholic countrymen have but changed one abject superstition for a worse. Much the Reformation, much Protestantism has improved them, if it has taught them to tell, instead of their beads, only their *pence*, with more devotion!

What better then should we expect among a people whose "thoughts are low," than Art on the same level, and critical literature half a head above that? In these days of promiscuous authorship and facile composition, when he who runs can write, almost every person thinks himself as well-fitted as his neighbour to discuss any given subject, and perhaps is. Yet, although we can scarce consider this an edition worthy of the Discourses, can we deny it worthy of the times and the prevailing taste? Broad-margined, hot-pressed paper, fine type, and picturesque illustrations, furnish out a very handsome quarto, alike creditable to the editor, printer, publisher, and public who patronize such merits. Had the originality of Mr. Burnet's Etching characterized his writing, we should have overlooked altogether his want of elegant style, nay, even of enlarged, exalted principles: many among his remarks on detail and mechanism appear judicious. It was not our design to glean a *spicilegium* of errors from his volume; we have taken a small handful for sample where we might have collected a sheaf. Let us add, likewise, that as Mr. Burnet has been the first to break the ice which covered the great deep of the Discourses, it is no wonder if he has fallen in and lost himself.

* It is far worse than affected enthusiasm, because its morbid ardour makes converts, and so spreads the contagion of corrupt taste.

† Most of his countrymen, we are convinced, read our "great national poet" after the same fashion that Sancho saw Dulcinea, by *hearsay*: they hear certain of his dramas at the theatre, and get a relish for them when spiced and sauced with the high-seasoning of stage-effect, scenery, machinery, decorations, and declamations. This is all, or almost all! George the Third confessed himself but a tepid admirer of Shakspeare, though a fervent applauder of O'Keefe; peradventure no few playgoers would admit they likewise preferred the farce-writer had they his Majesty's candour as well as his coarse taste.

OUR LIBRARY TABLE.

The Stage Coach; or, the Road of Life, by John Mills, Esq. 3 vols.—The author of this East London Decameron, more candid than the generality of his race, admits, in his preface, that the 'Old English Gentleman,' his former and first novel, was over-praised by the critics. We must not allow so good-tempered a preamble to tempt us into super-civility with regard to his second effort in fiction. Rating him by 'The Stage Coach,' Mr. Mills must take rank far below Dickens, or Hood or Hewlett; each of whom has hit off the fast-vanishing stage coachman, with far greater felicity than our author. Another club, too, by way of framework to a series of tales, is a cardinal mistake! Twice has the device been tried by "the only true and lawful Boz," and as often abandoned as unmanageable. Further, one or two of the tales introduced by the "chalked-off" coachman, are as sentimental as if the pale young gentleman in black, "who-sits-in-the-corner-and-is-with-the-greatest-difficulty-prevailed-upon," had sighed them out, instead of their being vented in the midst of fumes of Aldgate tobacco and purl. The hearse-driver's story of the medical student who unconsciously dug up his own mother, is too revolting to pass without reproof; while the tale of the impudent exploits of Mrs. Toddy, the dog-stealer, is but a maimed version of an anecdote told fifty times better elsewhere. The members of the club sing; but, for the greater

Digitized by Google

part, very melancholy ditties: nor are we sure how far their songs are original; one, 'There's a charm in spring,' being, if we recollect right, borrowed from 'The Village Coquettes' without acknowledgment. To end our notice with praise—the best story is the first, 'The Devil's Hunt'; and the whole work contains evidences of power and invention sufficient to make us warn Mr. Mills that unless his third work be far better than the second, no prefatory smile will hinder the critics from being after him "in full cry."

Extracts from the Municipal Records of the City of York, during the Reign of Edward IV., Edward V., and Richard III., by R. Davies.—These extracts, though they do not throw much additional light on the history of the times, and though some of them have been published before in the "Eboracum," will notwithstanding prove of interest to the antiquarian student. The appendix to the work contains a detailed account of the celebration of the festival of Corpus Christi at York.

Plays and Fugitive Pieces in Verse, by David Burn.

"Crush not the squash ere it becomes a pod."

We have had nothing in prose so Siddonian as this appeal of Mr. Burn to his critics, since the real

"Beef cannot be too salt for me, my lord,"

with which, if we may believe Scott, the one supreme Lady Macbeth answered the Provost of Edinburgh's table inquiry. But Mr. Burn's is altogether a solemn book; the farce and the tragedy it contains being wonderfully in the Crummles vein. By the way, did not that high-toned and heroic actor pass from America into Tasmania, whence these volumes emanate? Here, at all events, we have the dramatist after his own heart, who gives us an odd tragedy, called 'The Queen's Love,' founded on one of the stories in the 'Odd Volume';—and a 'Regulus,' in which Mr. Jacob Jones, author of 'The Cathedral Bell,' is honourably rivalled;—and a legend of "that terrestrial Paradise," Jersey, no less curiously wrought in fustian;—and 'Loreda,' an Italian romance, which might have been acted (managers have their lunes) had not 'The Recluse' been condemned, and the author's courage thereby damped;—and 'Our First Lieutenant,' a farce written to bring forward "a deserving young actress," now Mrs. Captain Barclay. To these are added some sentimental prose: and the author's solemn delight in his own works holds out from the first page, dedicating his miscellany to "dear Lady Franklin," to the last—a valedictory address, whence our motto is taken.

Leisure Hours, by F. C. Stewart.—The author takes a very favourable view of his own little volume, when he calls it "a thing of shreds and patches:" but with that description we will content ourselves—adding merely that the idlest man's most fallow time should be made to yield some better fruit than any that can deserve to be so characterized.

Exercises on Etymology, by W. Graham.—This volume, which forms one of Chambers's Educational Course, is a tolerably accurate account of the various sources from which the English language is derived. The derivations, however, are not unfrequently fanciful, and must appear more so to the reader who is unacquainted with Latin and Greek, and for whom the steps of derivation are not traced. The great defect in almost all etymological works is the want of some general laws to confine the erratic student within the bounds of probability, and this defect is not remedied in the manual before us.

Chemistry of the four ancient Elements, Fire, Air, Earth, and Water, by T. Griffiths.—This is a simple and practical exposition of the subject. The intention has been to avoid abstruse details, and supply useful and interesting information, and the end appears to have been attained, although the subject involves some of the most interesting portions of chemical science. The book will amuse as well as instruct.

The Dictionary of the Arts, Sciences, and Manufactures, by G. Francis.—A cheap, and therefore a useful publication, intended to lighten the difficulties of those who attend philosophical lectures and read scientific books, by explaining briefly the meaning of the terms in common use "in architecture, engineering, practical mechanics, manufacturing processes, the mathematics, the fine arts, and the experimental sciences." It is illustrated by 1,100 woodcuts.

List of New Books.—A Concise and Practical System of Stenography, by G. Bradley, 12mo. 3*s.* bds.—Panorama of the City of Chester, 2nd edit. with Illustrations and Introductory Essay, by John Trevor, Esq., 18mo. 2*s.* 6*d.* cl.—The Captive's Vow, or the Bashaw, a Moral Tale, by Charity Batchelor, fc. 8vo. 4*s.* cl.—Wanostrocht's Gil Blas, 6th edit. 12mo. 5*s.* roan.—Todd's Johnson's Dictionary, by T. FOREIGN CORRESPONDENCE.

THE following are extracts from letters received from Dr. Lepsius:—

Pyramid of Mœris, June 20.

"We have now been settled for some weeks on the ruins of the labyrinth of Mœris, and I hasten to give you the first information as to the definite discovery of the site of the true labyrinth and pyramid, a discovery which has cost us but little trouble. It was impossible, even at the first hasty glance, to doubt that we saw the labyrinth before and beneath us. We were astonished that earlier travellers had scarcely mentioned these remains, when we saw the ruins of hundreds of still well defined chambers lying before us. It will surprise you when you see by the drawings of Herr Erbkam (who has undertaken and executed his task with the greatest industry and talent) how much of these remarkable buildings still exists. No previous descriptions of them, known to me, not even those of Jomard and Coutelle, agree with the localities as we found them; and my dependence on the representations of Perring, the able architect of Col. Wyse, has been much diminished by the inaccuracy of his sketches of these ruins, the best preserved portions of which he has left out, proving that he did not recognize the regular boundary of the whole building. The main result of our investigation is, however, the finding on many of the pillars and architraves of the hall, the name of the true Mœris, who built the labyrinth for his palace, and the pyramid for his tomb. I send with this letter a treatise on the building of the pyramid, written by me while recovering in Cairo from a slight illness, which I wish to present to the Academy of Sciences in token of respect. In January I sent a drawing of the pyramid of Cheops, and several representations of tombs in the pyramids. I have also sent to Hamburg, *vid* England, a chest containing an ethnographical and geological collection from the White River, and two others containing Nile fishes for the anatomical museum. I have also here a small collection of stones found in the pyramids, and specimens of the innumerable sorts of vessels the fragments of which have been used for the filling up of the walls and roofs of the chambers of the labyrinth. We had before remarked this mixture of stone, gravel and potsherds in the ruins of Memphis, whose palaces and temples very much resemble the monuments we are now examining. Our plan of those ruins, prepared by Erbkam, is the first that gives a real idea of the vast proportions of those glorious buildings. We live here in great simplicity, enjoy very good health, and bear the various plagues of Egypt with uninterrupted patience and good humour."

In another letter of the Professor's, written on the same day, we find some additional information:—

"The pyramid of Mœris is the latest of all the pyramids of the Pharaohs. King Mœris reigned from 2194 to 2151, before our era, and was the last king of the old kingdom of Egypt before its conquest by Hyksos. Both the labyrinth and the lake prove his power, his love of magnificence, and his interest in the welfare of his people. On our arrival at Fayum we found that a most interesting paper had just been published, by a French architect, Linant, in the service of the Pasha, announcing his discovery of the site of the lake Mœris. He ascertained that scarcely any trace of it existed, and that only one portion of the gigantic dam which confined the waters still remained to the S.E. of Fayum. In the whole province there was but one other lake, that of Birket el Kerun, situated to the N.W., and this failed in several points in answering the conditions required for lake Mœris; being neither artificial, nor washing the city of Crocodilopolis nor the labyrinth, nor, in fine, answering to the great reputation and purpose of the real lake. This purpose was to receive the waters of the Nile at its overflow, and employ them during the dry season for the supply of the capital, Memphis, and the plains of the Delta. The lake discovered by Linant is of nearly equal circumference and depth with that of Birket el Kerun, and fulfils all these conditions. Every day we look from the pyramid, not as Herodotus did over the lake, but over the black soil on which lay the waters of lake Mœris, to the city of Fayum, which is built partly on the ruins of Crocodilopolis. If it were difficult to make out in Birket el Kerun the lake of Mœris, it assuredly was not an easier matter to overlook the real pyramid, which stands just as it was described of old with regard to the lake, and the city of Crocodilopolis. At the end of the vast plain of ruins lies the pyramid in which Mœris was buried, and to the south the village mentioned by Strabo, now in ruins, and separated from the labyrinth by a watercourse of later date. With regard to the ruins themselves, I can scarcely believe my eyes when I read the accounts of previous travellers. Where they saw formless hillocks and a few walls, we found at once several hundred chambers, some of them with roofs, corridors, and remains of columns. The rooms are so irregular and of such various sizes, that no one could have found their way, without a guide, through this mass of building, above two hundred feet broad. Herodotus describes three thousand apartments above and below the ground, an account which the remains lead me to believe not exaggerated. The forms of the most important part of the palace are described by Herodotus as consisting of twelve halls, that is, of twelve open courts surrounded by covered colonnades. This palace was surrounded by labyrinthine buildings on three sides, and now forms a four-cornered space covered with low hillocks, and intersected by a watercourse. Here our establishment of twenty-four men, three asses, two camels, rams, geese and fowls, five tents and several huts and stables built of the ruins of the pyramid, recals the old village of Strabo which lay on the same level with the pyramid. Around us are scattered huge blocks of granite, and a marble-like hard calcareous stone, the remains of the old pillars and architraves of the courts, which are of interest as offering in several cases the names of the builder, Mœris, and his sister who succeeded him. On the top of the pyramid waves the Prussian eagle. I am employing one hundred workmen in digging into the chambers, and latterly in searching for the entrance into the pyramid. We shall only remain here till Erbkam has completed his sketches. We shall then proceed rapidly through central Egypt to Thebes. Our visit to Meroe will be deferred till the April of next year.

OUR WEEKLY GOSSIP.

IN the present scantiness of town-talk, a little country-gossip may be acceptable: and when a Day's Excursion has proved to be neither profitable nor pleasant, a word of warning may be serviceable to those who, like ourselves, have few days to throw away. We shall, therefore, profit by the observations of a friend, who last week visited Waltham Abbey. Among the noticeable things he saw there, perhaps the subjoined few will interest our readers, though even these will scarcely prove of the class which sentimentalists entitle "interesting":—"This time-honoured, or dishonoured town, although but a dozen miles from London, and easily accessible from the North-Eastern railroad, I must pronounce about as unattractive a rendezvous for lovers of sub-

Digitized by Google

urban excursions, or gasping citizens who wish to 'breathe fresh air,' as one could see of a long summer's day. Its atmosphere is redolent of mud, and 'the fat weeds that rot themselves to death' on the banks of the Lethean Lea, whose sluggish waters encircle it,—the savoriest odour perceptible being exhaled by the eels, all alive, fried in their native ooze beneath the noontide sun. Less perfume, however, Sabæan or other, than might be apprehended, arises from the open sewers and unswept kennels, bountiful Nature having thrown a green mantle over them, which at once represses their too-powerful aroma, and furnished with its mossy fringe a retreat for those elegant reptiles that enliven the borders. Here and there a house—not a single street—exhibits attention to cleanliness or comfort—one or two picturesque points might be found, or fancied, but in general the place wears a look of decay, but decay without its venerable character, and of extreme irregularity without the charm of variety. Everything has a desolate cast at Waltham, yet nothing of sweet and solemn retirement; I would not take a gift of it, were sac, soc, toll and team granted me to boot, if the tenure compelled residence! Perfect harmony, indeed, prevails throughout it. The condition of the Abbey Church is quite akin to that of the town; or, rather, though it has had some care bestowed on it, the care is still more discreditable than neglect, as its noble Norman interior has been *whitewashed* so often for neatness sake, that all its beautiful details are covered up completely, which grime, the growth of ages, could not have done with half such offensive effect. Outside, also, the nastiness suffered to accumulate along the basement, is less odious than the patch-and-botch work repairs above it, because an observer can less inconveniently keep his nostrils shut than his eyes. The living may be considered a kind of *vicarious vicarage*, or perpetual cure, equivalent to a perpetual sinecure, the vicar being a perpetual absentee at Oxford, while his substitute at Waltham has some thousand souls under his guidance, but not a single parish trowel or besom. The churchwardens are the real patrons of whitewash within, and sordid plaster work without, and repulsiveness everywhere, like their brotherhood generally, over the whole land. I shall not mention names, however, as the chief barbarisms were committed by past churchwardens, and I hope the present functionaries will, after my preceding hints, find means to abate the removable nuisances which render this grand old church an abomination rather than an attraction. Let the burghers of Waltham take example from Cheshunt, scarce three bowshots distant, but half the globe away in refinement: its little church, with few architectural merits—indeed, little beyond neatness and a splendid view from the tower to boast of—had a charm for me that King Harold's proud mausoleum wants, with all its antiquarian riches. I spent the night and my pence at Cheshunt—perhaps the Walthamites will listen to that fact! No syllogism like an *argumentum ad crumenam* to convince such people; their brain is in their pockets!"

Apropos of these remarks upon Waltham Abbey, let us cite from a long letter with which Professor Hosking has favoured us, a brief passage, being all that concerns the subject:—

> The churchwardens and their fellow parishioners of St. Mary Redcliff deserve anything but the sneer cast at them in the *Athenæum* of last Saturday; and, moreover, the information with which we have been furnished regarding Hogarth's pictures in their church, is very far from giving a correct view of the case. Your informant has compared the circumstance that *the Vestry of the parish paid to Hogarth himself, in* 1757, 500 *guineas for the pictures* which they had commissioned, with the recommendation, which appears in the published abstracts of the Report by Mr. Britton and myself upon a survey of the church last year with reference to an intended complete restoration of that beautiful structure, that the pictures should be removed from their truly "obscure position." So far, however, are the churchwardens from having offered the pictures for sale, and the parishioners from desiring to get rid of them, that the further advice given by Mr. Britton and myself, that the pictures should be sold, in aid of the funds for restoring the church, was not adopted by the Vestry because of the strong feeling existing in the parish with regard to them.

Notwithstanding all our respect for the Professor, we beg leave to say that our informant, whom *he* "casts a sneer at," is quite as competent a witness, full as likely both to take and give "correct views of the case," as himself. He did not, and from his position could not, confound the two points abovementioned; but Mr. Hosking's own epistle betrays a bias towards confusion and incorrectness that renders us somewhat sceptical in receiving his counter-evidence. We never said the churchwardens had "offered the pictures for sale," or the parishioners desired "to get rid of them:" he precisely inverts our application of these expressions, and thus perverts their meaning. Besides, had he judged from our context, instead of a particular sentence, he would have found the sneer which discomposes his nerves was an ironical glance at parish authorities in the gross, and, even rather than at them, at the whole nation who pretend to idolize Hogarth, yet remain unacquainted with his works. But there are no persons so apt to overlook facts as your matter-of-fact people; they hold fast by the letter and lose the spirit, in which is the life of the truth. Cannot Mr. Hosking distinguish a general sarcasm from a direct accusation: perhaps he thinks we meant likewise to impugn the clergyman's *virtù*—or the clerk's—when we said the only individuals who felt Hogarth's altar-piece were those who dusted it? Are not churchwardens notorious throughout the three kingdoms for their love of whitewash, and for beautifying the complexion of their churches with this excellent cosmetic, at the sacrifice of every old-fashioned ornament? Are not parish folk renowned to the antipodes for their ignorance of Fine Art and knowledge of the pence-table? Such was the comprehensive scope we had before our mind's eye when we took St. Mary Redcliff as our observatory. However, Mr. Hosking approves himself a grateful partizan of his employers, if no very judicious one: he has placed them in this dilemma—they must either keep their Hogarth, to maintain their characters, or sell it, and thus confirm our informant's report! He admits, too, that the question of sale *did* engage the vestry, and his letter elsewhere announces his hope that the parishioners will make "Hogarth's pictures refund the money expended upon them, with compound interest." These items, we think, rather countenance the rumour we published, than disprove it; and why is Mr. Hosking so vexed with us for saying we heard the parishioners had done what he himself says they ought to do—for anticipating that which he expects from them, the improvement of their church and their church-fund by the sale of their inappropriate picture?

If we are to believe the reports of the daily papers, the long-talked of embankment of the Thames from Whitehall to Blackfriars Bridge, is at length about to be undertaken. Of the utility—we might say of the necessity—of some new line of communication from East to West, in this enormous and daily growing city,—of the beauty of such a terraced walk as is proposed, and of its advantages as a healthy promenade, there can be no question; but there are so many opposing interests, that we doubt if any ministry will undertake to battle with them, unless supported a little more heartily than heretofore by the public.

On Friday the 18th instant, the first stone of the Queen's College of Medicine at Birmingham, was laid by the Principal, Dr. Johnstone, assisted by Mr. G. Drury, the architect. The visitor of the College is Dr. Warneford, of whose beneficence it is another monument.

The cabinet of coins of the Asiatic Museum at St. Petersburg has recently been enriched by two valuable presents; one from the Minister of Finance, consisting of a number of Persian, Turkish, and Indian coins, chiefly of the early part of last century; the other from Lieut.-Col. Butenjen, of a collection of coins chiefly Mohammedan, from the countries on the Oxus, Jaxartes, and Indus. Many of these date as far back as the eighth century, and among them are several unique specimens.

More than one correspondent has inquired where and how they are to get a sight of the proposed façade of the British Museum. We regret to say, we cannot give them any information on the subject. It is difficult to account for the silence maintained respecting a work which must very shortly be commenced, and which ought to make that edifice one of the ornaments of the metropolis. The opportunity is as favourable as the occasion is important and noble; and yet, though the preparations have been actually commenced, no one seems either to know or to care what the façade is to be. Surely this is not altogether right and proper; and it contrasts, besides, very singularly with the interest the public is now presumed—even expected—to take in all matters connected with the fine arts and their advancement. Formerly, it is true, the public were supposed to have neither opinion nor voice on such occasions, yet formerly is no precedent for at present, when some show, at least, of deference is paid to public opinion. It must be admitted that the British Museum is not a case of competition, and so far there is nothing of that stir and excitement in regard to it, which there would have been under other circumstances; but surely no one will say that because the occasion affords no factitious interest of that kind, it is of no moment what is made of the building. The exterior of a great national museum ought to announce itself by studied beauty of design and refined taste, and should be a finished work of art. Unless, therefore, care be taken to render the façade in some degree entitled to such character, instead of being at all better, we are likely to be eventually less satisfied with it than with the present antiquated and sulky-looking Montague House. That was not erected for the purpose of a gallery of art, nor at a time when anything beyond the mere name was known in this country of Grecian Architecture. Accordingly, in that we could very well tolerate a great deal which, under altered circumstances, would be offensive and altogether inexcusable. Nor will it be enough that the new façade is an improvement as compared with the present building, should it not be found to have a high degree of positive merit also, without which it will seem little better than another valuable opportunity flung away. Our doubts and misgivings may be altogether groundless, but then why should there be any room for doubt at all?—why any sort of concealment? Whatever it may be as a production of architecture, the new façade of the Museum will be a very extensive one (nearly 800 feet in length, including the wings), and also a very conspicuous one, for it will be an object of mark to all strangers and foreigners who visit the metropolis; nevertheless, no assurance has been given us, nor has any one thought it worth while to inquire what it will really be. Of course, there will in time be an end to all concealment, all mystery, all doubts, surmises, and conjectures,—yet, what if the most unfavourable surmises should then be confirmed? As long as we can, we are willing to hope for the best, but as we have nothing on which to found such hope, we must also be prepared for the worst. We think, however, that it is now high time that the public should be a little enlightened on the subject, and not left to find out that a noble opportunity has been lost, when it shall have become altogether too late to think of retrieving it.

Several interesting discoveries have been made in the vicinity of Algiers. On the site of the old Julia Cæsarea a fine statue of white marble has been found, representing a youth taking a thorn out of his foot: and near it a monument of a knight piercing a soldier with his lance, and over it an inscription, in tolerable preservation.

The 'Medea' of Euripides, recently set to music by Taubert, was performed for the first time on the 7th inst., before a select audience, in the theatre of the palace at Potsdam. It was afterwards announced that it would be performed publicly at the Opera House at Berlin; but this, we regret to learn, is impossible, that House having been burned to the ground on the 19th inst., after having stood for exactly a century.

We mentioned, some time ago, that the medical commission sent into Egypt by the Russian government, to make experiments on the subject of plague, and the means of arresting the *virus*, had reported the complete success of caloric as an agent of purification. A letter from Cairo, published in the *Times*, gives some particulars of the proceedings from which this conclusion was obtained. The Commission, it seems, have come to the unanimous opinion that articles of any sort, after having been subjected to a temperature of from 50° to 60° of Reaumur, cannot communicate the plague. The Commissioners collected a large quantity of garments, of sundry tissues, and had them thoroughly impregnated with the supposed virus of the plague. These were placed in a chamber heated by a stove to the temperature of from 50° to 60° (Reaumur), and subjected to the action of the heat for forty-eight hours,

Digitized by Google

Sixty-six persons, of all ages and temperaments, including Turks, Egyptians, Syrians, and Negroes, were clad in the garments, and put into the closest contact with the articles which had been thus treated, and the result has been, that not one single person of the sixty-six has been attacked by plague, or his health affected in the slightest degree, by the experiments to which he has been subjected. No doubt (shrewdly suggests the letter from which we have made the above extracts,) it might have been well if the Commissioners had also ascertained whether the plague *could* be communicated by articles *not* having been subjected to this high temperature.

At the meeting of the Geological Section of the British Association on Saturday, Mr. Binney announced the discovery of an upright tree, nine feet high, in the coal strata at St. Helen's, near Liverpool, identical in species with some of the trees (Sigillariæ?) at Dixonfold and Manchester; the roots were remaining to the length of eight feet, these roots being undoubted Stigmariæ (the ordinary *S. ficoides*), with their radicles or "leaves" attached, and spreading out in all directions to the distance of two or three feet.

VENICE.—MORNING and EVENING EXHIBITION.—Under the patronage of the Emperor and Empress of Austria, the Kings and Queens of Prussia, Bavaria, and Holland (whose signatures may be seen in the Royal Album, in the Exhibition Room).—The Grand MODEL of the CITY of VENICE (with brilliant effect of sunshine, produced by artificial light), representing every object in the City.—Open to the public, at the Egyptian Hall, Piccadilly, from eleven in the Morning till Ten in the Evening.—Admission, 1*s.*

DIORAMA, REGENT'S PARK.

NOW OPEN, with a NEW EXHIBITION, representing the CATHEDRAL of NOTRE DAME at Paris, with effects of Sunset and Moonlight, painted by M. Renoux, and the BASILICA of ST. PAUL, near Rome, before and after its destruction by Fire, painted by M. Bouton. Open from Ten till Six.—N.B. A GRAND MACHINE ORGAN has been constructed expressly for this Exhibition, by Messrs. Gray and Davison, of the New-road, and will perform the Gloria, from Haydn's Service, No. 1, during the midnight effect of the Cathedral of Notre Dame.

THE CHINESE COLLECTION, Hyde Park-corner.—This UNIQUE COLLECTION consists of objects *exclusively Chinese*, and surpasses in extent and grandeur any similar display in the known world. The SPACIOUS SALOON is 225 feet in length, and is crowded with rare and interesting specimens of virtù. The Collection embraces upwards of SIXTY FIGURES AS LARGE AS LIFE, portraits from nature, appropriately attired in their native costume, from the MANDARIN of the highest rank to the wandering Mendicant; also MANY THOUSAND SPECIMENS in Natural History and Miscellaneous Curiosities, the whole illustrating the appearance, manners, customs, and social life of more than THREE HUNDRED MILLION CHINESE.—Open from 10 till 10.—Admittance 2*s.* 6*d.* Children under 12 years, 1*s.*

MUSIC AND THE DRAMA

The Haymarket again acknowledges the tasteful sway of the whilom master of the Olympic revels, who has animated the porcelain Corydons and Phyllises of our grandmother's mantel-piece, and grouped them on the stage in a *tableau vivant* worthy of Watteau; transporting the Bucolic masquerading of Versailles in the days of the Grand Monarque, to the lawn of the Duke of Queensberry's villa on the banks of the Thames, to form the opening scene of the new comic piece, 'Who's your Friend? or the Queensberry Fête.' The amusement is created by the introduction of a veritable rustic among the bevy of titled milkmaids and courtly swains, who are made to believe the "Zummersetshire" lad to be a Russian nobleman playing the part; and, to heighten the fun, the countryman is told that the word "Baron" is a challenge for a kiss. The sport that ensues may be readily imagined: the Cymon flutters stately dowagers and delicate maids of honour, and carries on the game of "kiss who kiss can" with ardour so genuine, that his rude assaults are relished even when repulsed. The imbroglio leads to an explanation, but not before some scenes of flirtation and retaliation, of a very diverting kind, have exhibited the frailty of a censorious dame, and the innocence of a calumniated damsel. Charles Mathews, as the countryman, has rarely appeared to better advantage; his Somersetshire dialect was genuine, and had evidently been carefully studied. He was hardly clownish enough, yet, had he been more so, the improbability of the incident would have been perhaps too glaring. Madame Vestris is a captivating dairy-maid of distinction, followed by a Negro boy in a silver turban, holding over her a feather parasol, and a footman in livery carrying her lapdog and milk-pail: and Mrs. Glover and Strickland are irresistibly droll as a coquettish Chloe and a dunderheaded Lubin. The fun is kept up throughout with spirit, by the aid of smart dialogue and clever situations; and though the piece is evidently from the French, the translator, whoever he is, deserves praise for the skill with which he has adapted it to our stage.

THIRTEENTH MEETING OF THE BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

CORK, AUGUST 16.

[*From our own Correspondents.*]

The General Committee assembled on Wednesday at three o'clock, and the chair was taken by the Earl of Rosse. The minutes of the last Meeting were read and confirmed.

Col. Sabine then read the Report of the proceedings of the Council during the past year, from which it appeared that in compliance with a resolution passed at a meeting of the General Committee, held at Manchester, June 29, 1842, application had been made to Government to undertake the publication of the catalogue of stars in the Histoire Céleste of Lalande and of Lacaille's Catalogue of the Stars in the Southern hemisphere, which have been reduced and prepared for publication at the expense of the British Association, and that Her Majesty's government had given the necessary directions for issuing 1,000*l.* for the completion of the work in question, at the same time stating "that the compliance with this application must not be considered as authorizing the expectation of pecuniary assistance in cases not in the first instance submitted to and approved by my lords." Respecting the arrangements for the care of the Kew Observatory, the Report stated that Mr. Cripps, its former curator, retains his apartments, without salary, undertaking to keep the house aired and the lower parts clean, receiving an allowance for coals, candles, &c. not exceeding 15*l.* per annum; and that Mr. Galloway has been engaged at a salary of 27*l.* 7*s.* 6*d.* per annum, with apartments, coals, candles, &c., to take charge of the apartments above the basement story, and of the property of the Association, and to render general assistance to members prosecuting researches in the Observatory. A few necessary repairs have been made, and, in addition to the apartments for Mr. Galloway, a sleeping-room has been provided for any member whose researches may require him to spend a night in the Observatory. The necessary instruments have been purchased, and a regular meteorological register was commenced by Mr. Galloway, under the superintendence of Prof. Wheatstone, in February last. For these various purposes the sum of 133*l.* 4*s.* 7*d.* has been expended in the present year. Prof. Wheatstone will report on the Self-registering Meteorological Apparatus, for which a grant of 50*l.* was made at Manchester, which has been completed and placed in the Observatory; he will also report on the Electrical Apparatus, the expense of which has been defrayed by private subscriptions. The Council have to report the establishment of the following registries, viz.—1. An ordinary meteorological record, with standard instruments; 2. A meteorological record with self-registering instruments on a new construction; 3. A record of the electrical state of the atmosphere. It is proposed to add a register of the comparative amount of rain at different heights above the surface, and of the temperatures beneath it, for both which purposes the locality appears particularly well suited.

The Council have added the names of M. Bessel, of Königsberg, M. Jacobi, of Königsberg, Dr. Adolphe Erman, of Berlin, M. Paul Frisciani, Astronomer at Milan, and Prof. Braschman, of Moscow, to the list of Corresponding Members of the Association.

The rule adopted at Manchester for issuing tickets at 1*l.* each, admitting Associate Members to sectional meetings only, was revived and extended to the sons of members under age.

The officers of Sections were then appointed, and directed to assemble in their several committee rooms at the rising of the General Committee, for the purpose of electing committees, and arranging the business of the ensuing day.

The following were chosen Members of the Committee of Recommendations:—

Sec. A. Professors Lloyd and M'Cullagh.—Sec. B. Marquis of Northampton, Professors Apjohn and Kane.—Sec. C. Richard Griffith, Esq., Charles Lyell, Esq.—Sec. D. H. E. Strickland, Esq., W. Thompson, Esq.—Sec. E. Sir James Pitcairn, M.D.—Sec. F. Sir C. Lemon, Bart., James Heywood, Esq.—Sec. G. Professor Mac Neill.

The General Committee then adjourned to Monday at three o'clock.

THURSDAY, AUGUST 17.

SECTION A.—MATHEMATICAL AND PHYSICAL SCIENCE.

President—Prof. MacCullagh.
Vice-Presidents—Prof. Lloyd, The Very Rev. the Dean of Ely, Mr. W. S. Harris.
Secretaries—Prof. Stevelly, Mr. J. Nott.
Committee—Lord Adare, Sir W. Hamilton, Rev. T. R. Robinson, Col. Sabine, R.A., Rev. Dr. Scoresby, Dr. Langberg, Capt. Larcom, Mr. J. S. Russell, Dr. Scott, Mr. R. Leahy, Dr. Green, Mr. E. Hodgkinson.

The President, on taking the chair, remarked on the connexion between pure mathematics and the physical sciences, and the reasons which had induced the Association to class them together as objects of the same Section. The geometer may pursue his speculations to an indefinite extent, without any reference to the external world; but he finds the best and most useful applications of them in the field of physical research and in the study of those material laws, the knowledge of which is an essential element in the progress of the human race. Independently of their utility, the mind feels a natural—almost an irresistible tendency to such applications. Even the great geometer of antiquity (Archimedes), who thought his science degraded the moment it became conversant about material objects, and was made subservient to merely useful purposes, was yet compelled, by the strong impulse of a natural curiosity, to deviate from the proud but narrow rule which he had prescribed to himself; and then the same splendid genius which had enabled him to find the proportions of the cylinder and sphere, and to approximate to some of the most refined methods of the modern geometry, led him to lay the foundation of *Rational Mechanics*—of that science which has since grown to such a wonderful extent, and has contributed so powerfully to the advancement of civilization. The mathematician instinctively feels that the laws of the visible universe are written in the diagrams of geometry and in the symbols of analysis; and this remarkable correspondence, established by the will of the Creator, between the mathematical conceptions of the human mind and the phenomena of the external world, was perceived by the philosophers of remote antiquity as clearly, and recognized as fully, as it is by us at the present day. It was the perception of this truth which caused Pythagoras to say that *numbers* are the principles of all things, and Plato to affirm that *geometry* is employed in the construction of the world. So great, indeed, was the predilection of Plato for geometry, that he required a previous acquaintance with it from all those who wished to become students of his philosophy; but while we agree with him as to the great importance of that science, more especially as an introduction to the study of Physics, we shall not follow his example so far as to inscribe over the door of our Section Room—"Let no one, who is not versed in geometry, enter here:"—for then we should exclude that large and important class of physical inquirers, whose object is merely the discovery of new facts, and of elementary laws, which are the expressions of such facts. For, in this way, much may be done, and much has been done, by men slightly, or not at all, acquainted with mathematics: in which category will be found some of the most eminent names of modern science. But beyond such elementary laws, it is impossible to proceed, (as many an inventive mind has found when it was too late) without the help of Mathematical Science, which alone is competent to grasp the higher generalizations, and to discover those remoter laws which link together the more complicated classes of phenomena, and enable us to compute them in all possible cases. The President concluded by stating that, at the request of the Committee, the Rev. Dr. Robinson would read Mr. Baily's Report on the British Association Catalogue of Stars. The Report in question stated that the reductions are now finished, and recommended that some addition should be made to the former grants to meet some extra expenses.

Dr. Robinson then presented a Report from the Committee appointed to prepare the British Association Catalogue of Stars; the reduction was complete; the sum of 550*l.* had been voted for its publication, and the objects of the Report were to require a decision as to the number of copies which should be printed, and an additional grant to publish the necessary explanation of the catalogue. As many of those present might not be acquainted with the accounts of this catalogue given at former meetings, he would trespass on the indulgence of the President for a few

Digitized by Google

minutes, to explain its value. Among the heavenly bodies, the stars were generally considered as motionless, and were used as points of comparison for their more erratic companions. In this respect, an accurate determination of their places is of high importance; but it becomes still more interesting from the fact that we now know many of them to be in motion, so that it is difficult to find one absolutely fixed, and the research of their proper motions becomes matter of great interest. This is effected by comparing their places observed now, with those accurately determined at a former epoch. Now to do this is not so simple as might at first sight appear. When the observation is actually made, the least part of the work is done. In the first place, we do not see the star in its true place; the motion of light makes it to be observed in advance of that, as the earth moves; secondly, it is referred to the pole and equinox: these points are not fixed in space; the one nods by the action of the sun and moon, the other moves with irregular precessions by the same force, and that of some of the planets. The observed place must therefore be corrected for aberration, nutations, &c. before it is of any use, and the mean of several such mean places, gives the result which we want. Now all this is very troublesome, and was often loosely performed, till Mr. Baily, whose Report has just been read, published the Catalogue called by the name of the Astronomical Society. That, which contained about 2,800 stars, has changed the history of Stellar Astronomy. Formerly from 30 to 40 stars, called standard, were observed, and the rest overlooked; so that in an emergency of a comet, or an occultation, there was often no reference possible, and direct observations of the individual object were requisite. In the eighteen years since it was published, he believed all its stars were very well determined. Its great advantage was, the system of logarithms computed for each star, which gave, with extreme facility, the corrections above described. But their numbers change with the changes of the stars' places, so that already they require an alteration. The advantages of this work were such, that the Association thought no more important service could be rendered to Astronomy than the extension of Mr. Baily's catalogue. It now contains nearly 10,000 stars, and the secular changes of the constants are given with them. Besides, in the places of the stars there is an important improvement; the places in the former catalogue were derived from a comparison of those given by Bradley for 1745, and Piazzi for 1800: whatever error was in either of these, was multiplied by the mode of computation when brought up to 1830; but this fault was, in the present instance, corrected. On the whole, he thought it would be one of the most creditable works of the Association, whose name it was to bear, and without whose aid it would not have been executed. He could speak feelingly of the overwhelming labour which it saved the astronomer, and was confident that all of them, foreign as well as domestic, would receive it with gratitude.

A communication from Prof. Powell 'On Elliptic Polarization of Light reflected from various substances,' was then read by Prof. Lloyd. In a communication to the Association, at the Manchester Meeting, the author stated, among other results connected with this subject, that he had observed the phenomena of elliptic polarization in polarized light reflected from several mineral substances, in which it had not been (as far as he was aware) hitherto noticed. This inquiry bears upon the general question, to what substances is the property of converting plane into elliptic vibrations in the reflected light, confined? As far as observation has yet gone, it seems restricted, in general, to *metallic* substances, whether pure or compound; but to this there seem to be some exceptions, and it remains to be determined what *proportion* of metal, in a compound, is necessary to produce the result. As these questions will require an extensive range of observations for even a limited solution, the author is anxious to lay before the Association a list of all the substances he has examined; in the hope that others will be added to their number, whether by the independent experiments of those who may have access to such specimens, or by their favouring the author with the loan of such substances for examination. [This communication was accompanied by a list of twenty-three substances examined by the author, in sixteen of which elliptic polarization was detected.]

Prof. Lloyd then gave a brief account of some investigations in which he had been recently engaged, with the hope of explaining theoretically the phenomena of metallic reflexion. The physical hypothesis from which he sets out is, that the elasticity of the ether (which is usually assumed to change abruptly at the confines of transparent media,) varies *gradually* at the surface of a metal, so as to constitute, in fact, an infinite series of thin plates of infinitesimal thickness. In such a medium, it is natural to suppose that there will be an infinite series of infinitesimal vibrations, reflected at every point in the course of the ray, the sum of which will constitute the resultant vibration. On pursuing the inquiry, however, the author found reason to conclude that there could be no sensible intensity in the reflected light without a sudden change in the elasticity of the medium; and he was accordingly driven to combine this hypothesis with that already referred to, the ether varying continuously up to a certain plane, at which an abrupt change took place. On this principle he has obtained expressions for the magnitudes of the reflected vibrations corresponding with those of Fresnel, the *two* angles which enter the formulæ being connected with the original angle of incidence by the known law of the sines by means of two constants. These expressions seem to explain, generally at least, the variations in the intensity of the light reflected from metals; but it remains to account for the difference of phase depending on the plane of polarization. The author hoped that he would be excused by the Section in laying before it an outline of a theory still incomplete. The problem, however, is one encompassed with difficulties; and any attempt, however imperfect, to obtain its solution may serve to direct further investigation.—This communication gave rise to an animated conversation, in which the President, Prof. M'Cullagh, and Sir W. Hamilton, took part.

The President, at the request of Prof. Lloyd, then alluded briefly to some recent researches of his own on the same subject. He had endeavoured to connect the laws of metallic with those of crystalline reflexion, by a *mathematical* generalization, which brought out the empirical laws of the phenomena; but he did not give the particulars of his investigation, as it had not proved satisfactory to his own mind. The method of Prof. Lloyd, on the contrary, had the merit of proceeding on a *physical* hypothesis; and his results were certainly deserving of great attention, as the problem was one of the most difficult that could be proposed in the present state of science, and the cause of the peculiar action of metallic bodies upon light seemed to be involved in mystery.

Prof. Kane proceeded to read a paper by Prof. Draper, of New York, 'On a Change produced by Exposure to the Beams of the Sun, in the Properties of an Elementary Substance.'—He preliminarily described the general properties of the solar beam as acting on chemical substances, and pointed out the brilliant success with which the experiments of Daguerre and Niepce, of Herschel, Talbot, and Hunt, had been crowned. He reminded the Section, that in analyzing the solar beam, all parts of it were not found equally active in producing chemical effects; and that, in fact, the conclusion was now very generally admitted, that in the solar beam there are three distinct sets of rays:—those possessing heating properties, which are the calorific rays; those producing the sensation of light—the luminous rays; and those which effect chemical changes, which Dr. Draper proposes to call the Tithonic rays; for he, adopting the idea of peculiar matters of light and heat, considers that the chemical effects are produced by a peculiar material agent, which he terms Tithonicity. Dr. Kane then proceeded to read Prof. Draper's paper itself, which commenced with announcing the principle that "Chlorine gas, which has been exposed to the daylight or to sunshine, possesses qualities which are not possessed by chlorine made and kept in the dark. It acquires from that exposure the property of speedily uniting with hydrogen gas. This new property of the chlorine arises from its having absorbed tithonic rays, corresponding in refrangibility to the indigo." The property thus acquired is not transient, like heat, but permanent. A certain portion of the tithonic rays is absorbed, and becomes latent, before any visible effects ensues. Light, in producing a chemical effect, undergoes a change as well as the substance on which it acts: it becomes detithonized. The chemical force of the indigo ray is to that of the red, as 66.6 to 1. The author remarked, that we are still imperfectly acquainted with the constitution of elementary bodies, inasmuch as we know, in general, only those properties which they possess after having been subjected to the influence of light.

Prof. Stevelly inquired whether the other of the two gases upon which Prof. Draper had experimented, the hydrogen gas, had been found to possess the same property of acquiring this permanent power of combining by exposure to solar light.—Prof. Kane replied that the inquiry was so obvious to a person engaged in the research, that he inferred, from the total silence of Prof. Draper upon the subject, that hydrogen did not possess the same property.—The Rev. Dr. Robinson begged leave to state, what seemed to him confirmatory of Dr. Draper's views as to the distinction between the *Tithonic* and luminous rays. He was induced by some newspaper statements to think that the Daguerréotype might give very exact representations of the inequalities of the lunar surface. He therefore procured the apparatus, and, by previous practice, acquired the requisite skill. A plate prepared by Claudet's process was then exposed, in the place of the image of a Cassegrainian reflector, of 15 inches aperture. The intensity of the light was such that when the image of the crater Copernicus, one of the brightest in the moon, came into the field of view, it dazzled the eye; but though the telescope was carried by a clock-movement of extreme precision, after an exposure of half an hour, there was shown after mercurializing, but a faint and indistinct image, or rather trace. Another plate, similarly prepared, gave, in half a minute, on a cloudy day, a most perfect picture of his house, in which minute details were shown by the microscope. He therefore inferred, that as the heat accompanying the solar rays was not found in the light of the moon, being probably absorbed there, so these other rays were also absorbed, though possibly in a less degree. The apparent complementary relation between the colour of chlorine and that of the ray which seemed to have the highest power, was curious, and excited a wish to know if anything similar occurred in respect of the vapour of iodine, or if this power was confined to the blue end of the spectrum. The experiment would not be easy, but Dr. Kane could probably manage it.—Prof. Kane promised to try the experiment suggested by Dr. Robinson, upon his return to his laboratory. He also remarked, that in the course of certain investigations, he had met with some results, which, now that the subject had been opened by Dr. Draper, he was inclined to attribute to the same cause. They were cases of the action of chlorine on organic liquids, in which the action was much more violent with a small quantity of liquid than with a large quantity, as if the light, being detithonized in passing through the larger mass, lost its energy in producing chemical action.—Mr. R. Hunt urged the necessity of broadly distinguishing, by appropriate names, the three constituent kinds of rays which are united in the solar beams, viz., those producing heat, light, and chemical action.—The President inquired, from Mr. Hunt, whether he considered these three kinds of rays which accompanied the solar beam to have the same origin, as, for instance, adopting the theory of vibrations as true for the luminous rays, did he conceive the calorific and the chemical rays were also merely vibrations in an elastic medium? If so, it was difficult to conceive the manner in which the permanent effect could be produced without calling in to the aid of the elastic ether, the molecular constitution of bodies themselves. This subject, in his opinion, demanded more attention than had hitherto been bestowed upon it.—Mr. Hunt considered that the three kinds of rays must unquestionably have the same origin.—Dr. Green said, that when he compared the results obtained by Dr. Robinson with these detailed by Mr. Hunt, he was inclined to infer that some permanent change was effected in light by the reflexion at the metallic surfaces of the specula.—Mr. Nott said, that the delicacy and minute exactness of a Daguerréotype drawing when executed by the aid of the evening sun, was to a surprising degree beyond the effect of

Digitized by Google

the mid-day sun.—Mr. Hunt said, that he had found the mid-day sun far more energetic and rapid in its effects than the evening sun.—Prof. Stevelly said that the two statements were quite reconcileable, as Mr. Hunt spoke of the rapidity with which the effect was produced: whereas the statement of Mr. Nott had reference to the delicacy and minute correctness of the effect.

SECTION B.—CHEMISTRY AND MINERALOGY.

President—Prof. APJOHN.
Vice-Presidents—Marquis of NORTHAMPTON, Prof. KANE.
Secretaries—Mr. R. HUNT, Dr. SWEENY.
Committee—Prof. Stevelly, Dr. O'Shaughnessy, Major Beamish, Drs. F. Tamnau, Pickells, W. Gore, Messrs. T. Jennings, F. Jennings, W. West, J. de Cantabrana, F. G. Argles.

A letter was read from Professor Lyon Playfair, explaining the circumstances which had prevented Dr. Bunsen and himself from prosecuting their inquiries into the gases evolved from iron furnaces, for which a grant of 50*l.* was made at the last meeting, and recommending a renewal of that grant.

'Chromatype, a new Photographic Process,' by Mr. R. Hunt.—We are indebted to Mr. M. Ponton for the discovery of the first photographic process in which chromatic acid was the active agent. He used a paper saturated with the bichromate of potash, which, on exposure to sunshine, speedily passed from a fine yellow colour into a dull brown, giving, consequently, a negative picture. E. Becquerel improved upon this process, by sizing the paper with starch previously to the application of the bichromate of potash, which enabled him to convert the negative picture into a positive one by the use of a solution of iodine, which combined with the starch in those parts on which the light had not acted, or acted but slightly, forming the blue iodide of starch. These pictures are, however, tediously produced; they are seldom clear and distinct, and failure too frequently follows the utmost care. While the author was pursuing an extensive series of researches on the influence of the solar rays on the salts of different metals, he was led to the discovery of a process by which positive photographs are very easily produced. Several of the chromates may be used in this process; but the author prefers those of mercury or copper, the most certain effects being produced by the chromate of copper, and, indeed, in a much shorter time than with any of the other chromates. The papers are thus prepared: good writing paper is washed over with a solution of the sulphate of copper and partially dried; it is then washed with a solution of the bichromate of potash and dried at a little distance from the fire. Papers thus prepared may be kept for any length of time, and are always ready for use. They are not sufficiently sensitive for use in the camera obscura, but they are available for every other purpose. An engraving—botanical specimens or the like—being placed upon the paper in a proper photographic copying frame, it is exposed to sunshine for a time, varying with the intensity of light from five to fifteen or twenty minutes. The result is generally a negative picture. This picture is now washed over with a solution of nitrate of silver, which immediately produces a very beautiful deep orange picture upon a light dun colour, or sometimes perfectly white ground. This picture is quickly fixed by being washed in pure water and dried. The author remarked that, if saturated solutions were used, a negative picture was first produced, but if the solutions were diluted with three or four times their bulk of water, the first action of the sun's rays was to darken the paper, immediately upon which a very rapid bleaching action followed, giving an exceedingly faint positive picture, which was brought out in great delicacy by the nitrate of silver. It is necessary that pure water should be used for the fixing, as the presence of any muriate damages the picture, and hence arises another pleasing variation of the chromatype. If the positive picture be placed in a very weak solution of common salt, the images slowly fade out, leaving a very faint negative outline. If it be taken from the solution of salt and dried, a positive picture of a lilac colour may be produced by a few minutes' exposure to sunshine. Prismatic analysis has shown that the changes are produced by a class of rays which lie between the least refrangible blue, and the extreme limits of the violet rays of the visible prismatic spectrum—the maximum darkening effect being produced by the mean blue ray, whilst the bleaching effect appears to be produced with the greatest energy by the least refrangible violet rays.

'On the Influence of Light on the Growth of Plants,' by Mr. R. Hunt.—The peculiar influence exerted upon the germination of seeds and the growth of the young plants by coloured light, has been for some years the subject of the author's investigations. The results show the surprising powers exerted by the more luminous rays in preventing germination, and in destroying the healthful vigour of the young plant. Plants, when made to grow under the influence of the red rays, bend from the light as something to be avoided; while the blue or chemical rays are efficacious in quickening the growth of plants. Since the publication of the last Report, the author has tried plants of a great variety of kinds, and the same effects have been produced. It has, however, been found, that although blue light accelerates germination, and gives a healthful vigour to the young plant, its stimulating influences are too great to ensure a perfect growth. The strength of the plant appears to be expended in the production of a beautiful deep green foliage; and it is only by checking this tendency, by the substitution of a yellow for a blue light, that the plant can be brought into its flowering and seeding state. The etiolating influence of the green rays was observed upon, as well as the power which plants possessed of sending out shoots of a great length in search of that light which is essential to their vigour.

FRIDAY.

'On newly-discovered Three-twin Crystals of Harmotome, so arranged that they form a regular Rhombic Dodecahedron,' by Dr. F. Tamnau, of Berlin.—The celebrated Mohs was the first who observed that the modification of the primary form of harmotome was such as could never belong to the pyramidical system, in which it was placed by Werner and his disciples. Messrs. Phillips and Brooke gave measurements of the mineral, and confirmed the idea of Mohs. During a residence in Paris Dr. Tamnau met with a very beautiful three-twin crystal of harmotome, and also in Bohemia, in a basaltic rock in the neighbourhood of Aussig, on the bank of the river Elbe. It was accompanied with small crystals of analzime—little white crystals of chabasite,—and some yellow-brown crystals of carbonate of lime, which specimens were exhibited. Each of these little groups of crystals consists of three single crystals, so arranged that the axes cross each other at angles of 90°. By this arrangement the faces of the pyramid on the one crystal falls exactly together with the faces of the same pyramid of the other crystal; and if those faces were enlarged so much, that the faces of the prism should not be visible, they would give the form of a regular rhombic dodecahedron. Not only are the angles of the pyramid exactly determined independent of any single measurement, but it is also decided that the two angles of the pyramid are of the same value, and consequently that the mineral is not in its primary form of the right *rectangular*, but that it is a right square four-sided prism. And it may at the same time be observed that, however the distribution of the secondary faces may show the harmotome to belong to the prismatic system, we have in it a remarkable instance of a mineral which is pyramidical in its mathematical measurement, and at the same time prismatic in its physical qualities.

'On the Heat of Combination,' by Dr. Andrews.—The object of this communication was to announce the following general principle, as a consequence of previous researches of the author on the same subject, and to give a general account of some recent experiments which appear to him to establish its accuracy. The law may be thus stated: "When one base displaces another from any of its neutral combinations, the heat evolved or abstracted is always the same when the base is the same; or, in other words, the change of temperature which occurs during the substitution of one base for another in any neutral compound, depends wholly on the bases, and is in no respect influenced by the acid element of the combination." To test the accuracy of this principle by direct experiment, equivalent solutions of various neutral salts were decomposed by the addition of a dilute solution of the hydrate of potash. When the strength of the solutions and their temperatures were properly adjusted, the same variation of temperature always occurred during the decomposition of salts of the same base. If the base (in the state of a hydrate) developed, when alone, less heat than the hydrate of potash in combining with the acids, an elevation of temperature occurred during the decomposition of its salts by the latter; if the reverse were the case, the decomposition of the salts was attended by a diminution of temperature. Thus the decomposition of equivalent solutions of the salts of the oxide of copper, was attended by the evolution of the same amount of heat, as was also the decomposition of the salts of the oxide of zinc; but the heat extracted by the former was about twice as great as that extracted by the latter, because the oxide of copper produces less heat in combining with the acids than the oxide of zinc. The salts of lime furnish an example of an absorption of heat when their solutions are decomposed by potash,—a circumstance easily explained by the fact which has been before established by the author, that the hydrate of lime, when combining with the acids, developes more heat than the hydrate of potash. But, in accordance with the principle before stated, the diminution of temperature is the same with equivalents of all the salts of lime. In an inquiry of this kind many precautions are requisite, in order to obtain accurate results. Among the most important may be mentioned, the exact neutrality of the salt to be decomposed, a perfect equality of temperature in the solutions before mixture, and the precipitation of the oxide in the state of a pure hydrate, and not of a subsalt.

Prof. KANE thought it highly probable that the law propounded by Dr. Andrews will eventually be judged by chemists to be the most important communication made to this Section.—Prof. APJOHN observed, that the hydracids and oxyacids developed the same amount of heat in combining with a base.—Prof. KANE observed, that if we mix an atom of oil of vitriol with an atom of water, a considerable degree of heat is developed. Now, the concentrating of this dilute acid was not simply a case of evaporation, but one of decomposition; and it would appear that the same quantity of heat was necessary to effect that decomposition as was developed during the combination.

'On the Formation of Paracyanogen,' by Mr. T. Spencer.—The method by which the author proposes readily to form paracyanogen is, to take a solution of cyanide of potassium, sp. gr. 1200, at a common temperature. A current of chlorine is then passed into the solution, until it is thoroughly saturated, which is indicated by effervescence taking place on its surface. While passing the chlorine, the temperature of the solution is pretty rapidly raised, until it has acquired from 180° to 190° Fahr.; and at the period of saturation, dense white fumes are observed to pass off, which afford strong indications of ammonia and cyanogen. At this stage of the proceedings the solution becomes dark and turbid, and a black precipitate is observed to fall to the bottom of the vessel. If left to stand for a few hours, it will be found that a copious precipitate has settled, while the solution has assumed a scarlet colour. The liquid being decanted, the precipitate is collected on a filter and washed. This last operation should not be performed oftener than necessary, as the paracyanogen thus formed is, to a slight extent, soluble in water. This is the only property it seems not to have in common with the same substance formed by heat in the crucible, which the author supposes renders this substance harder than when formed in the wet way. The cyanide of potassium used was prepared in the way recommended by Liebig. When the solution has absorbed a volume or two of chlorine, the solution assumes a very beautiful red colour, which gradually becomes an opaque scarlet. Chlorine may still be passed through the solution decanted off, and fresh portions of paracyanogen obtained. Experiments were made with bromine and iodine; and it was found, that by combining these substances with the cyanide of potassium, paracyanogen is formed in the same manner as with chlorine.

Mr. WEST read a paper 'On a remarkable case of Corrosion of Lead by Spring Water, after passing through an Iron Pipe.'—In the case related, the water of a spring, which had flowed into and from a leaden reservoir for sixty years without injury to either, and which passed through leaden pipes with-

Digitized by Google

out metallic impregnation, when further conveyed a long distance, through iron pipes, contained lead in solution, and was so destructive to the bottoms of the leaden cisterns, into which it next flowed, that some of them had to be renewed in five or six years. Mr. West stated the analysis of the water in question, which, except as to the lead, were the same when taken from all the three situations; he imputes the mischief to contact with oxide of iron from the pipes, and considers that the remedy must be mechanical, by coating the iron pipes or the leaden cisterns with some other substance, so as to preserve the lead itself from contact with peroxide of iron.

'Report of the Progress of the Inquiry into the Chemical History of Colouring Matters,' by Prof. Kane.—Dr. Kane stated, that as yet but little progress had been made in this inquiry. Some members of the committee were however engaged in the investigation of the colouring matters of the lichens, and a few interesting results had been obtained.

'On the Decomposition of Carbonic Acid Gas, and the Alkaline Carbonates, by the light of the Sun,' by Prof. Draper, New York.—The decomposition of carbonic acid gas, by the leaves of plants under the influence of the light of the sun, is one of the most remarkable facts in chemistry. Dr. Daubeny, in a very able paper in the Transactions of the Royal Society for 1836, came to the conclusion, that the decomposition in question was due to the rays of LIGHT, a result obtained by the agency of coloured glasses, but which does not appear to have been accepted by later authors, who have attributed it to the chemical rays. There is but one way by which the question can be finally settled, and that is by conducting the experiment in the prismatic spectrum itself. When we consider the feebleness of effect which takes place, by reason of the dispersion of the incident beam through the action of the prism, and the great loss of light through reflexion from its surface, it would appear a difficult operation to effect the determination in this way. Encouraged, however, by the purity of the skies in America, I made the trial, and met with complete success. The plan followed, was that already described for determining the active ray, in the case of chlorine and hydrogen.* A series of tubes, half an inch in diameter and six inches long, were arranged, so that the coloured spaces of the spectrum fell on them. In these tubes, water, impregnated with carbonic acid gas, and containing a few green leaves (*poa annua*), was placed. It was expected, that if the decomposition be due to the radiant heat, the tube occupying the red space, or even the one in the extra-spectral red space, would, at the close of the experiment, contain most gas. If it were the "chemical rays," in the common acceptation of the term, we might look for the effect in the blue, violet, or indigo spaces; but if it were the LIGHT, the gas should make its appearance in the yellow, with some in the green, and some in the orange. I made the trial several times, and found it much more easy to accomplish than I had expected. The results were briefly as follows:—In the tube that was in the red space a minute bubble was sometimes found, but sometimes none at all. That in the orange contained a more considerable quantity; in the yellow ray a very large amount, comparatively speaking; in the green a much smaller quantity; in the blue, the indigo, the violet, and the extra-spectral space at that end, not a solitary bubble. From these facts, in connexion with some results obtained by the use of bichromate of potash, as an absorptive medium, I conclude that it is the rays of light which effect the decomposition, and that the rays of heat and the tithonic rays have nothing to do with the phenomenon. The alkaline bicarbonates are easily decomposed by elevation of temperature, yielding a portion of their acid at the boiling point of water. Instead of using a solution of carbonic acid, I endeavoured to effect the decomposition of these salts by leaves in the sunlight, and found that it took place with facility. Nor is the effect limited to the removal and decomposition of the second atom of the acid. It passes on to the first; the neutral carbonate of soda itself decomposing and yielding oxygen gas. In like manner the sesquicarbonate of ammonia may be made to yield a very pure oxygen gas. Dr. Draper, in concluding this communication, alludes to his method of multiplying the Daguerréotype pictures, as published in the *Philosophical Magazine*, and then mentions a process of precipitating copper, after the picture has been fixed by gold, by the electrotype process, on the plate, which, as he states, gives a very perfect copy. "It is difficult," says the Professor, "to describe in words the beauty and perfection of these '*copper-tithonotypes*.' The problem of multiplying the Daguerréotype may be now regarded as completely solved."

Prof. APJOHN made a few remarks on this communication, which announced results so different from our received ideas on this subject, it being generally agreed that the chemical rays were the most active in producing the decomposition of the carbonic acid absorbed by the plant. He then called upon Mr. R. Hunt, who had paid much attention to this subject, to state the result of his experience to the Section.—Mr. HUNT said, that he had listened with great surprise to Dr. Draper's paper, as, from his own experiments with coloured glasses and transparent media, carefully analyzed so as to determine what rays were absorbed, and what rays passed through them, he had arrived at conclusions diametrically opposed to those now put forth. He acknowledged that he had never tried the experiment with the pure rays of the prismatic spectrum, but he should certainly lose no time in doing so on his return to England. Mr. Hunt then noticed some peculiarities which had been observed in the light of southern climes, to which he was at present inclined to attribute this difference in the result of experiments.

* See Report of Section A.

THURSDAY.

SECTION C.—GEOLOGY AND PHYSICAL GEOGRAPHY.

President—Mr. R. GRIFFITH.
President for Geography—Mr. R. I. MURCHISON.
Vice-Presidents—Messrs. W. HOPKINS, C. LYELL, J. TAYLOR.
Secretaries—Messrs. F. JENNINGS, H. E. STRICKLAND.
Committee—Marquis of Northampton, Major S. Clerke, Mr. E. Forbes, C. Y. Haynes, M.D., Mr. J. Heywood, Lieut. de Koksharoff, Mr. C. B. Newenham, Prof. Owen, Messrs. J. Phillips, R. Taylor, H. Townsend, R. W. Townsend, Rev. D. Williams, Messrs. E. Winterbottom, D. Gilbert, Sir R. Steele, Sir C. Lemon, Messrs. W. Hatfield, E. W. Binney, H. N. Nevins, T. Oldham.

'On the structure of the Appalachian Mountains,' by C. Lyell, Esq., F.G.S.—Mr. Lyell exhibited and explained a transverse section of the Appalachian chain of Mountains in North America, communicated by Professors W. B. and H. D. Rogers, and intended to illustrate the law of structure prevailing throughout that chain. Mr. Lyell had himself verified those phenomena as seen in Pennsylvania, in company with Professor H. D. Rogers, and had also observed the same in crossing the mountains of Maryland, between Baltimore and Pittsburg. The structure of this chain was previously explained to the Meeting of the British Association, at Manchester,* but, from the absence of illustrations, was not then understood or duly appreciated. Mr. Lyell dwelt on the great importance and originality of these communications, which had been deduced from many years of careful observation.

'On the Phenomena and Theory of Earthquakes, and the explanation they afford of certain facts in Geological Dynamics,' by H. D. Rogers, Professor of Geology in the University of Pennsylvania, and W. B. Rogers, Professor of Natural Philosophy in the University of Virginia.—The authors first proceed to examine the *phenomena attending earthquakes*, commencing with the following propositions:—1. Earthquakes consist essentially of a wave-like motion of the whole solid ground. 2. The earthquake undulation is not simultaneous throughout the whole area agitated, but is *progressive*, and propagated with enormous velocity. 3. The undulation is transmitted sometimes in the manner of an elongated, curved, or nearly straight belt, moving parallel to itself, and sometimes in the manner of a dilating elliptic or circular zone. The authors then describe earthquake phenomena as divisible into such as are of invariable occurrence, and therefore characteristic, and such as are only occasionally witnessed. The *characteristic phenomena* consist, as announced by the Rev. John Mitchell, of Cambridge, in the Phil. Trans. for 1760, of a peculiarly rapid *undulation*, or wave-like motion of the ground, and a sharp vibratory jar, or *tremor*; the undulation generally extending further from the source of the earthquake than the tremor. The *occasional phenomena*, observable only when the earthquake is violent, are a deep rumbling and grating noise, an alternate opening and closing of parallel fissures, and the escape of steam and sulphureous and other vapours, and hot water, from those fissures. In confirmation of these observations, the authors cite the earthquake of Conception, in 1835, described by Captain Fitzroy, and that which visited the island of Hayti, in May 1842. As examples of the second proposition, they mention the earthquake of Lisbon, and two others which have occurred during the present year. The first of these took place on the 4th of January, and was felt along the valley of the Mississippi, from the military posts on the frontier west of that river, to the coast of Georgia, and from 31° N. lat. to Iowa, a distance of about 800 miles in each direction; it occurred about 9 P.M., and was sufficiently violent to excite some alarm; throughout the region agitated the motion was both undulating and vibratory. From a comparison of the dates of the shock at twenty-seven different localities, it appears to have been simultaneous along a certain line, stretching in a N.N.E. direction from the western margin of Alabama to Cincinnati, a length of more than 500 miles; it was also synchronous along other lines parallel to this; places to the westward experienced the shock earlier than the other localities, the intervals being in proportion to the distance. From these facts the authors infer "*that the area agitated at a given instant was linear*, and *that the earthquakes moved from W.N.W. to E.S.E. in the manner of an advancing wave*. The velocity with which the shock was propagated appears to have exceeded thirty miles per minute. The second, or *Guadaloupe earthquake*, was felt along the Windward Islands, at Demerara, and Guiana, Bermuda, and most of the principal cities of the Atlantic seaboard of the United States, from Savannah to New York. Its range, in latitude, amounted to 35°, and in longitude, to 23°: the longest diameter of this elliptical area extending from Demerara to New York, was about 2,300 geographical miles; and its breadth, from Bermuda to Savanna, 770 miles. The principal intensity of the disturbance was confined to a nearly N. and S. line, or belt, embracing St. Vincent's, St. Lucia, Martinique, Dominica, Guadaloupe, and Antigua; and thence prolonged to the continent of South America, and to Bermuda. Along this curved axis the shock was simultaneous: and from a comparison of observations made at other stations, it appears to have been propagated eastward and westward at the rate of twenty-seven miles per minute. In the second part of their communication the authors propose a *theory of the origin and movement of earthquakes*, as applied by them in explanation of the structure of the Appalachian Mountains. According to this theory, the wave-like motion of the earth's surface during an earthquake is of the nature of an "actual billowy pulsation in the molten matter," upon which they suppose the crust of the earth floats, "engendered by a linear or focal disruption and immediate collapse of the crust, accompanied by the explosive escape of highly elastic vapour." The progressive waves of oscillation thus developed on each side of the axis of disturbance, would move off in parallel order, and form a dilating elliptic zone. Supposing the earth's crust to be ruptured only at a focal point, as in the orifice of a *volcano*, the receding pulsations would be approximately *circular*; whereas, if the line of fracture were greatly elongated, and the pulsations observed but on one side, the advancing belt of waves would appear straight.

The sea-waves caused by earthquakes are described as broad undulations of the water, moving in the same direction with the pulsation of the crust beneath, at the rate of three and a half miles per minute in the case of the New England earthquake of 1756; and at the rate of five miles per minute during the great Lisbon earthquake, the waves succeeding each other at regular intervals of five minutes. Assuming these sea-waves to correspond with the undulations beneath, the authors calculate the *breadth of the crust waves* in the Lisbon earthquake at twenty-five miles; and in the earthquake of Conception, where the undulations averaged four per minute, and travelled forward at the rate of forty-two miles in the same time, each wave possessed a breadth of at least ten geographical miles. *The tremor attending earthquakes* is considered as the *effect* of the crushing of the strata during, and caused by the undulations, rather than as the result

* See *Athenæum*, August, 1842.

Digitized by Google

of waves of vibration, which would be dispersed and destroyed by the broken condition of the materials and their heterogeneous composition.

Application of the theory of earthquakes.—From these considerations the authors infer, that when earthquakes produce any *permanent* elevation or depression of the land, the tracts so affected will generally have the shape of elongated parallel belts, as exemplified in the Ullah Bund in the Delta of the Indus, the elevation of the coast of Chili, and the local arching of the surface across the bed of a river in Chili, mentioned by Darwin. Referring to their memoir on the Appalachian chain, the authors contend that the structure of those mountains (and, by analogy, those of other countries) implies the operation of far greater and more sudden forces than the gentle secular changes observed in modern times; and they consider it impossible to avoid the conclusion, that all the more extensive revolutions of the earth's crust have involved, to a greater or less extent, the *agency of vast earthquake waves*. To the action of these waves, in different geological epochs, they attribute the formation of the vast masses of conglomerate and detrital deposits distributed in the various groups of strata; also the transport of the great northern drift, and the polished and furrowed surfaces of rocks both in Europe and New England.

In the course of the discussion, which followed the reading of this paper, Major S. Clerke begged to mention a fact which had come under his own observation. Having witnessed the great eruption of Mount Vesuvius in 1822, it occurred to him to ascertain whether any reciprocity existed between that volcano and the small crater of the Solfatara, near Pozzuoli, distant about ten miles, in a line across the Bay of Naples. On proceeding to the latter place he was informed by the Custode, an intelligent man, that since Vesuvius had been in activity, the Solfatara had subsided. Major Clerke, on a personal examination of the aperture forming the vent of the Solfatara, found this to be the fact, the usual eruption and loud noise having ceased. When Vesuvius relapsed into quiet, the Solfatara resumed its activity.

'An Account of the late Earthquake at the Islands of Antigua and Guadaloupe, on the 8th of February, 1843,' by the Hon. Capt. Carnegie, M.P.—The earthquake is described by the author of the communication as having been felt, generally, among the Leeward Islands, but more particularly at Antigua and Guadaloupe. At both these islands the shock took place at twenty minutes before eleven o'clock, A.M., and it does not appear to have been preceded by any of the usual signs of earthquake; the weather was clear and fine, the sea-breeze blowing as usual, and the inhabitants engaged in their daily avocations. At Antigua the earth heaved and undulated suddenly; the hills oscillated, and huge masses of rock were detached from their summits and precipitated into the valleys; large fissures opened in the ground and closed immediately. The water in the harbour whirled round and round, enveloping the islands in a cloud of dust, which shut them from view, and in the space of two minutes and a half all Antigua was laid in ruins. In this island only eight persons lost their lives, owing to the black population being employed, as usual, among the canes, but the loss of property was immense. At Point-à-Pitre, in the island of Guadaloupe, the effects were much more fearful. In magnitude, this was the second town in the West India islands; it was situated upon a piece of low ground, surrounded on three sides by the sea, and entirely built of stone to avoid the effect of hurricanes. At the time of the earthquake, most of the inhabitants appear to have been at their late breakfast, in consequence of which 4,000 perished among the falling houses or in the fire which broke out immediately after; the destruction of the whole town was so complete, as to present, after the earthquake, the appearance of a vast stone quarry. The landslips were very numerous, and all the springs in the vicinity of Point-à-Pitre were instantly dried up. The shock was felt slightly as far north as Washington and Bermuda, and southward, to Demerara, travelling in a N.N.E. and S.S.E. direction; several slight shocks were subsequently felt at different periods.

'On the Direction of the Currents, by which certain Gravel Hills and Erratic Blocks were distributed in the north of the counties of Mayo and Sligo,' by R. Griffith, Esq.—Mr. Griffith states, that the erratic block deposits of Ireland were distributed by a force moving generally in a north-west and south-east direction, modified, however, in many localities by the opposition of mountain ridges and deep valleys. This deposit consists usually of clay and rolled fragments of limestone, derived from the carboniferous rocks, which occupy two-thirds of the island; and these materials seldom exhibit any trace of stratification. It frequently exceeds one hundred feet in thickness, and occupies all the valleys, and even the interior of the mountains, occurring either in one thick mass, or in elongated ridges, known by the name of *Eskers*. The prevailing direction of the mountain ridges of Ireland is north-east and south-west, that is, at right angles to the supposed direction of the current by which the drift was deposited; in consequence of this, the deposits of detrital limestone are distributed only on the north-western declivities of the hills. In the granite and slate hills of Wicklow, the limestone gravel has passed through the valleys of that range, and formed a valuable deposit to the east of Mount Leinster, spreading over the Cambrian slate, east of Newtown Barry, in the county of Wexford; the same facts may be observed in the Slievebloom mountains, in the Galtees, and the Monavullagh mountains. The summit of Blatinglass Hill, on the northern edge of the Wicklow granite district, is 1,256 feet above the level of the sea; to the eastward of this hill there is no limestone gravel, whilst it is abundant on the lower hills, and in the valleys to the south; to the north of this hill the gravel is seen at an elevation of 880 feet, from which Mr. Griffith infers, that the transporting force did not operate at an elevation exceeding 1,000 feet. Besides the limestone gravel, boulders of granite and conglomerate are occasionally found scattered on the surface, and not included in the clay drift; from the peculiar composition of the granite of certain districts, it is not difficult to detect the locality from which these blocks were derived, and hence the author has been enabled to detect small boulders of the Connemara granite, in the valley east of the Slievebloom mountains, also in King's County, and in the limestone district of Galway; indicating a north-west and south-east direction, in the line of transport, throughout a very large portion of Ireland. This direction, however, has not been universal. In the counties of Sligo and Mayo there are two ranges, namely, the Ox and the Curlew mountains, having nearly parallel directions from north-east to south-west. The Curlews consist of reddish-brown sandstone, connected with the upper Silurian system; the Ox mountains, situated about twelve miles north of the Curlews, are composed of mica slate and granite, whilst both ranges are flanked by strata belonging to the carboniferous system. South of the Curlews the gravel contains limestone only, and the *eskers* extend in a northern direction up the southern declivities of the hills; towards the summit, boulders of yellowish-gray limestone are scattered on the surface, while downwards to the limestone valley, on the northern side, the surface is thickly covered by very large boulders of reddish-brown sandstone, sometimes weighing several tons, the largest occurring nearest the ridge; towards the base of the Ox mountains these boulders are still very numerous, but much diminished in size. Ascending the mica-slate ridge of the Ox mountains, small boulders of red sandstone still occur, together with small *eskers* of limestone gravel, sometimes remarkable from their forming ridges *directly across the valleys*, as in the valley of Lough Easky. To the north and south of this lake the rock is mica slate, but at the lake itself there has been an extensive protrusion of granite. In the line of the road to Easky, two miles south of the lake, the valley is crossed at right angles by two *eskers*, composed of rolled fragments of limestone and some clay; they are thirty feet in height, and very steep; their elevation above the plain, from which they have apparently been derived, is 250 feet; numerous large boulders of mica slate are strewed over their surfaces, but none are intermixed with the gravel. Approaching Lough Easky, there is an elongated sinuous *esker* nearly parallel to the line of the valley; it is composed altogether of pebbles of quartz and mica slate, mixed with sand and clay, all derived from the adjoining mountains, thus forming a moraine, which may be accounted for on the hypothesis of Agassiz. Following the valley of Lough Easky to the sea shore, a distance of ten miles, the entire surface of the limestone country is thickly strewed with large boulders of granite; some of these close to the shore are of enormous dimensions; one of them being about one hundred tons in weight. They occur also along the whole line of coast westward, from Easky to Erris, in Mayo, and with them a few rolled blocks of mica slate, occasionally, but no limestone, though the entire district, which is comparatively low and flat, is composed of strata belonging to the carboniferous system. These granite boulders are precisely similar in composition to the granite of Lough Easky, Lough Talt, and Foxford. Taking all these facts into consideration, it is evident that in these localities the currents must have been from the south, and not, as in other districts of Ireland, from the north-west to the south-east.

Section D.—Zoology and Botany.

President—Mr. W. Thompson.
Vice-Presidents—Messrs. R. Ball, R. Owen, Prof. E. Forbes, Mr. C. C. Babington.
Secretaries—E. Lankester, M.D., Messrs. R. Patterson, G. J. Allman, M.B.
Committee—Mr. R. Dowden, Dr. Harvey, Rev. W. Hincks, Rev. Dr. Hincks, Messrs. W. Clear, J. T. Mackay, H. E. Strickland, J. Humphreys, E. Winterbottom, Drs. Power, C. Croker.

Dr. Lankester read a paper, from Mr. Robert Milliken, on a supposed anomaly in the Fructification of the Violet.

Mr. Babington said that the author of the paper had described the appearances correctly, but had come to a wrong conclusion. The fact was, that in Viola some flowers were later than others in appearing, and that the later ones were generally imperfect, not having any corolla. The later flowers appearing without petals had misled Mr. Milliken to the supposition that these produced their fruit as the result of the flowering of the first flowers.—Prof. E. Forbes stated that the absence of petals was a permanent state of some of the species of the violet.

'On the addition of the Order Nucleobranchia to the British Molluscous Fauna,' by Prof. E. Forbes.—Four years ago the author noticed minute needle-shaped animals floating in the waters of the Frith of Forth and of the British Channel, which, when examined under the microscope, presented several anomalous characters, which rendered their true position in the animal series doubtful. At the time he was able to make but an imperfect examination of them, which he laid before the Wernerian Society. He has since met with much larger animals, belonging to the same genus, inhabiting the Mediterranean seas, which enabled him to refer them to the genus Sagitta of Quoy and Gaimard, placed by those naturalists in the immediate neighbourhood of Firola, in the order Nucleobranchia. Both the British and Mediterranean animals have linear-lanceolate bodies, terminated anteriorly by an oval head, and posteriorly by a horizontal tail. Along the sides are two pair of fins, also placed horizontally, the undermost pair being large in the British, and extremely small in the Mediterranean Sagitta. From the latter the following points of structure were made out. On each side of the head is a row of curved bristle-like processes, which can be erected or depressed at the will of the animal. On the head are two distinct black eyes. The mouth opens into a straight intestine, terminating in a vent where the body begins suddenly to contract, at about two-thirds of its length. On each side of this vent, but opening on the opposite side of the body, is a slightly curved canal, terminating in a *cul de sac*, and resembling closely the canals which contain the pinnated appendages of the cydippe, but empty. The fins are of various shapes, and appear to form a sound basis for specific distinctions. They are rayed. The length of the largest specimen was two inches. The British examples were very minute. M. D'Orbigny has figured and described several species of Sagitta, which he observed during his South American voyages; but the details of his observations do not exactly coincide with those of Professor Forbes. The body which D'Orbigny styles a heart was not seen by the latter in any case; and the only circulation observed was an obscure movement of fluid with granules in the posterior part of the body behind the anus. No appearances of cilia were seen on the external surface. The author concluded, that however anomalous the characters of these curious animals might seem,

Digitized by Google

it was nevertheless convenient, and probably correct, to arrange them among the nucleobranchous mollusca. To the same order he was inclined to refer the shell called, by Dr. Fleming, *Fusus retroversus*, and which appears to be identical with, or at least very nearly allied to, the *Atlanta trochiformis* of M. D'Orbigny.

Mr. THOMPSON produced a work of Sars, from which it appeared that a similar animal had been found near Bergen, in Norway. The animal in question, therefore, inhabited a large range from south to north.—Dr. ALLMAN had some years ago discovered the *Sagitta* about an inch long, on the south coast of Ireland, and regretted that he had not at the time an opportunity of describing it.—Mr. Thompson had seen Dr. Allman's drawing, and believed the two animals to be of the same kind.—Prof. FORBES said, that with regard to the position of the *nucleobranchiata* in the animal scale, he believed they were analogues of the Acalephæ, only higher up in the scale; they were a step in the progression from polypes through the mollusca up to the vertebrata. In this progression they passed through the cephalopoda, which they resembled in many points. Although an animal might be low down in the direct scale of classification, yet it might possess many of the functions of beings higher up. Thus the cephalopoda frequently present more vertebrate functions than many of the vertebrata themselves.

Mr. MACKAY exhibited specimens of the Irish saxifrages. He called attention to the species resembling the London Pride (*Saxifraga umbrosa*), and with the specimens of the species he also exhibited several varieties of *S. geum*, *S. hirsuta*, *S. h. polita*, &c.—Mr. BABINGTON remarked, that Saxifraga was a difficult genus to study. There were many specimens on the table, which, if they came from different countries, would be naturally described as species, but which, as they were all gathered in Ireland, he had no hesitation in calling varieties. It was no proof that a plant was a species because it remained the same in cultivation for a great length of time, for many varieties did that. He had paid great attention to the saxifrages, and of those belonging to the London Pride tribe, he believed that only *S. umbrosa elegans*, *geum*, and *hirsuta*, were species. The variety, *S. u.* of Mr. Mackay, was not the London Pride of the English gardens, which was identical with the London Pride of the Pyrenees.—Prof. FORBES said, that the difference between botanists, with regard to species and varieties, could only be reconciled by ascertaining from each writer an estimate of the value he attached to particular characters. For the want of this there was much confusion even in Botany, but the evil was much greater in Zoology. The vague manner in which the characters of animals were drawn up by British zoologists, was a constant cause of complaint among continental naturalists.

The Rev. W. HINCKS then called attention to two living specimens of the *Neottia gemmipara* of Smith. This very rare plant had been discovered by Mr. J. Drummond in a salt marsh near Castleton Bearhaven, in the county of Cork, in 1810. From an imperfect specimen, Sir J. S. Smith had described and figured it, and it had not been seen again till 1841, when it was re-found by Dr. Sharkey. Only one specimen was again obtained, and it was with difficulty identified with the original specimen in the Linnean Herbarium in London. Dr. Wood and Dr. Harvey had, during the past week, both gathered living specimens, which were now on the table. The original plant was not a Neottia, as had been supposed by Smith, but was now referred to Spiranthes.—Mr. BABINGTON stated, that he had carefully examined the plant on the table, and believed that it was a genuine Spiranthes. It was a matter of great interest, as probably this plant was one of the rarest in the world. There was no record of its having been found anywhere but in the locality from whence these specimens were brought.—Mr. Hincks stated, that among some Californian plants received in London, had been found what appeared to be a *Spiranthes gemmipara*.

Dr. ALLMAN exhibited specimens of a Linaria which he had gathered in Ireland. He believed it to be a new species, and had described it at a meeting of the Royal Irish Academy. It had been supposed to be the *Linaria Italica* of Treviranus, which had also been found in England, but this plant differed in many respects from *L. Italica*.—Mr. BABINGTON thought the plant of Dr. Allman differed from the English *L. Italica*. Should this Linaria be a new species it will probably be new to the European Flora.—Dr. Allman stated, that botanists in London had pronounced his plant a hybrid, and Mr. Mackay concurred with this opinion.—Dr. Allman then exhibited specimens of the very rare *Trichomanes speciosum*, and also of one discovered by Mr. Andrews of Dublin, which differed from it in many points, and which might probably turn out a new species. The principal features of difference that this fern presented were, the possession of bipennate fronds, long bristles, and the triangular form of its fronds: in all these points it differed from *T. speciosum*.—Mr. MACKAY had cultivated the plant in question since Mr. Andrews discovered it, and it was his conviction that it was a new species.

FRIDAY.

The SECRETARY read a report from Mr. Blackwall, 'On the Functions of the Palpi of the Araneidæ,' which had been called for at the last meeting of the Association. After stating all the opinions hitherto formed, as to the functions of the palpi of the Araneidæ, the author detailed a series of experiments on the subject, and the conclusions derived from them.

Prof. OWEN acknowledged the pleasure with which he had listened to this paper, and gave a complete view of the difficulties attending the assignment of the true function to the palpi of spiders. In alluding to a portion of Mr. Blackwall's paper, he gave an account of the structure and functions of the ovarial sac of aphides, accounting for the well known fact of the anomalous reproduction to which they were subject. He inquired whether any cases were recorded in which the ovary of plants bore seeds for successive periods without the contact of the pollen-tubes.—Dr. LANKESTER recollected the instance of a plant in the Botanic Garden at Kew bearing fruit and seeds, in which instance it was impossible to discover any organ resembling the stamen or assuming its functions.

Mr. PATTERSON then read a paper, by the Rev. J. B. Clarke, 'On the Irish Species of the Genus Limax.'—Two species were described in detail, which had not been included, by previous writers, in the British catalogue, the *Limax arboreus* of Bouchard, and the *L. Gagates* of Draparnaud and Ferussac. The *L. arboreus* is not uncommon in the wooded districts of Ireland, especially on the ash and the beech; concealing itself during the day-time under the moss and the trunk. *Limax Gagates* (Draparnaud), the Irish specimens of this limax agree with Ferussac's variety β. The only British species with which it can be compared, as to form, is *L. Sowerbii*. In some districts of Ireland the species is not uncommon; frequenting gardens and thick herbage. In the course of the paper all the British Limaxes were mentioned as occurring in Ireland, with the exception of *Limax brunneus* (Draparnaud), which had not as yet come under the notice of the author.

Prof. FORBES considered this as one of the most valuable papers that had been written on the genus Limax, which had been little attended to, though forming an important link in the scale of creation.—Mr. THOMPSON observed that this paper was interesting, as recording two forms of Limax in Ireland, which were not only new to Ireland, but did not at present exist in the British Fauna.

Dr. ALLMAN then read a paper 'On the Anatomy of *Plumatella repens*,' which was illustrated by diagrams, as well as specimens of the animal preserved in spirit. The author divided his paper into two sections; in the first of which he gave the zoological characters of the zoophyte, and in the second entered into the zootomical details of its structure. In the first part of the paper it was attempted to reduce to some sort of order the chaotic mass of synonyms with which the zoophyte in question was encumbered. This was facilitated by keeping in mind the existence of two variations, which *Plumatella repens* is seen to assume. In one of these, the zoophyte will be found attaching itself to flat surfaces, as the under side of stones, and of the floating leaves of water plants, &c., being closely adherent in its entire extent. In the second variation it will be found fixed to surfaces of small extent, as submerged stems and pieces of stick, and, as the animal continues to develope, the branches having no extensive surface of attachment will become free, and a more or less enlarged bushy mass will be the result. *Plumatella repens* exhibits, in a high degree of perfection, the molluscan type of structure; and a distinct pharynx, stomach and intestine may easily be traced. Connected with the mouth, there is here, as well as in other fresh-water zoophytes of the same order, a very singular valve-like organ. The structure of the animal's stomach was described by Dr. Allman with much detail. Two distinct groups of muscles may be detected in *Plumatella repens*, one, which corresponds with the anterior set of retractor muscles, described by Dr. Fane in the Ascidian zoophytes of the sea; and another, analogous to the opercular muscles of this anatomist. The ova will be found to consist, as in those of Alcyonella, of a central disk, inclosing the embryonic matter, and of a rim which surrounds the disk, and from which it differs considerably in structure. The disk is formed of two membranes, each of which is composed of a single layer of minute vesicles. These membranes differ from each other in the size of the component vesicles; and as there is but a single layer of vesicles in each, one face of the disk must consequently be thinner than the other. Both faces are concave on one side and convex on the other, and the concave sides being opposed, and the edges united, a closed space is thus formed, which is filled by an immense number of minute whitish globules, floating in a gelatinous fluid, and which are afterwards to be developed into the perfect zoophyte. The walls of the disk are of a horny elastic texture, of a deep brown colour, and when emptied of their contents are found to possess some degree of transparency. There would appear to be no possible way by which the ova can be liberated from the tubes but by the decomposition of the latter; and we accordingly find, after the zoophyte has entirely disappeared from the surface of the stone, on which it crept, rows of these bodies occupying the place of the original polypidom, and mapping out its several ramifications. Notwithstanding the apparently complete destruction of the polypidom, the ova are found closely adherent to the substance to which the zoophyte had been fixed. This would appear to be effected through the medium of that portion of the tube to which they adhered, for the remainder of the polypidom, becoming decomposed and washed away by the action of the water, this alone remains, being protected on each side from the influence of external agents.

Prof. OWEN then made several inquiries of Dr. Allman, with regard to the condition of the muscular fibres when in a state of contraction, and whether his observations, on this point, coincided with those of Dr. Arthur Fane.—Dr. ALLMAN stated, in reply, that the muscles were shorter when acting, and sinuous, but he had not observed nodules in the muscles of fresh-water zoophytes.—Prof. Owen thought that Dr. Allman was right in placing these animals as allies of the compound Ascidia, in which position they must be regarded as analogous to, though having no close affinity with, the polyps. Their tentacula and the vibratile cilia of their respiratory organs were in accordance with their generally elevated structure. They have, in fact, a high degree of organization, but this was generally arrested in a low stage of developement.—Mr. PATTERSON stated; in connexion with the subject of the tunicated Ascidians, that he had often found, in the thoracic cavity of the *Ascidia communis*, numerous small crustaceous animals; he wished to know if this was a singular fact.—Mr. PEACH then described the form of small bodies which he had found floating about in the water, in which he had kept specimens of the species of *Sertularia* and *Campanularia*. From the Sertularia there proceeded thousands of small globular bodies which were covered with cilia, and which were sensitive to the touch; he supposed these must be ova. He did not think they were the tentacula of the animal, as they were floating about by thousands.—Prof. FORBES, in reply to Mr. Patterson, stated, that the existence of crustacea was not unfrequent in the thoracic cavity of many of the tunicated mollusca. He had found them in the Salpa in great numbers. Some of these crustacea were very large. The phosphorescence of the Salpa, which was often observed, did not depend so much on the animal itself, as on the crustacea

Digitized by Google

contained in their inside. He considered the small bodies with cilia, described by Mr. Peach, to be the young of some of the forms of the Medusæ. The other was also, probably, a young form of Medusa, and had been described by Sir J. Dalyell, as the young of a Sertularia.—Dr. LANKESTER had found *Plumatella repens*, at Campsall, in Yorkshire, and as this was an uncommon animal, it might be useful to those who wished to examine its structure, to know its locality. He regretted that the public was not yet acquainted with Sir J. Dalyell's valuable researches.—Prof. Forbes was glad to be able to state that Sir. J. Dalyell had made arrangements for publishing his very valuable collection of drawings, as well as his observations on the habits of the radiate tribes of animals.

'On the Habits of the Marine Testacea,' by C. W. Peach.—The author commenced with stating that the *Purpura lapillus* deposits its *nidi* all the year round, but is most active in the first four months of the year: the young escape from the *nidi* in about four months. *Buccinum reticulatum* deposits its *nidi* on weeds, stones, and the wicker-work of the store pots of the crab-catchers. They are strung together and overlie each other like the brass scales on the straps used for holding on the caps of soldiers. They are of the shape of the spade on playing cards. The author is also of opinion that the *Patella lævis* and *Patella pellucida* are the same shell, the one being the young state of the other. He then went on to describe the *Fissurella nubecula*, and to show that this shell has a serrated instead of a plain margin, and that the apex is surrounded by three teeth. In consequence of it having been asserted, at the meeting of the British Association at Plymouth, that the *Saxicava rugosa* was not an inhabitant of deep water, the author stated that he had got specimens alive in limestone five leagues from the land, and in thirty fathoms water. *Pholas lamellata* was found, also, under similar circumstances, in red sandstone. He next proceeded to describe the *Pholas dactylus*, which he had found in clay slate, in Cornwall, and to describe particularly the form and actions of the animal which he had kept alive in his house more than a month (there were fifteen or sixteen shells of all sizes); and although he marked the slab in which they were, he could not perceive that they *turned round for the purpose of boring*. In the same slab he also found *Pholas parva*.

Prof. FORBES pointed out the fact, that *nidi* of all the mollusca afforded a good ground for the formation of specific characters of secondary value. This was more especially the case with regard to the carnivorous mollusca. He hoped Mr. Peach would continue his researches on *Patella pellucida* and *lævis*, for he still must consider them as distinct species, especially as he had seen *pellucida*, which was considered often as the young of *lævis*, larger than *lævis* itself. He believed that two distinct species might be specifically alike when young, and their characters only become apparent through age. He did not, however, believe, with Agassiz, that there might be two species identically the same and yet distinct by being created at different periods. With regard to *Buccinum reticulatum*, nothing had been previously known of its habits, as it was always thrown up dead upon the shore. He had also found *Saxicava rugosa* in the deep sea in the Mediterranean, but it was not always confined to a calcareous bottom, as supposed by Mr. Peach. He hoped that Mr. Peach would continue to prosecute his researches with regard to the habits of the Marine Invertebrata.

Mr. HUMPHREYS then read a paper on the Mollusca of the County of Cork, of which he enumerated 230 species, besides 55 species of the Articulata and 25 of the Radiata.

Mr. THOMPSON stated that, of the Echinodermata mentioned in this list, all the rarer forms had been figured by Prof. Forbes, in his 'History of British Star-fishes.' The crustacea were interesting, as many of them had been added to the list by Dr. V. Thompson, when he resided in Cork. Of the land and freshwater shells on the list, the *Linureus involutus* was known only in the south of Ireland. The marine shells were exceedingly abundant, as the Cove of Cork was, after Bantry Bay, the best station for them in Ireland. One of these, a new one, had been named after the author of the paper, *Buccinum Humphreysianum*. This was not, as had been supposed, the *B. anglicanum* of Lester.

Mr. H. G. STRICKLAND then read the Report of the Committee appointed to investigate the length of time during which seeds would retain their vitality. Several experiments were making, and the committee still invited the attention of the members to this subject, as they would be glad to receive, from any source, seeds of which the great age could be clearly ascertained.

THURSDAY.

SECTION E.—MEDICAL SCIENCE.

President—Sir JAMES PITCAIRN, M.D.
Vice-Presidents—W. BULLEN, M.D., C. P. CROKER, M.D., A. H. CALLAHAN, M.D., C. BULL, M.D.
Secretaries—J. POPHAM, M.D., R. S. SARGENT, M.D.
Committee—Drs. D. B. Bullen, Houston, Cronin, J. F. Duncan, Townsend, Olliffe, Wherland, Bevan, Howe, Harrison.

Sir James Pitcairn in the chair.

The PRESIDENT read a letter from Prof. Sharpey, of London, in reference to the researches which he was carrying on with M. Erichsen, on the subject of Asphyxia; and expressing a hope that the grant of money made at the last meeting, to defray the cost of the experiments, which are not yet concluded, would be continued.

Dr. OLLIFFE (of Paris) read a paper 'On a peculiar Disease of the Biliary Ducts.'—The affection to which he was about to call attention, had never yet, he believed, been described by any author, and was of great importance, as it proved fatal in the case first brought under his notice. It occurred in the person of an officer who had resided for many years in India, and during that time suffered from the "Jungle Fever," or a peculiar intermittent of the tertian type, which was afterwards renewed in a slight form in Italy. Many years afterwards he was attacked by symptoms, not of an aggravated character at first, such as slight nausea, every morning, but not amounting to vomiting, with debility. Then rigors of daily occurrence set in, followed by fever, terminating in diaphoresis; he seemed labouring under an attack of ordinary intermittent fever. The periodical symptoms were removed by the administration of quinine; but the debility increased, with some tenderness over the region of the liver, which appear to be hypertrophied. Notwithstanding the most careful treatment, conducted under the advice of the most eminent Parisian physicians, the patient died. On a *post mortem* examination, the viscera of the great cavities appeared perfectly sound, with the exception of the liver, which was hypertrophied, but its general parenchymatous structure seemed healthy, with the exception of the mucous membrane of the biliary ducts, which was thickened, softened, and readily separable from the tissue beneath it; the ducts were enlarged and filled with a quantity of pus, and this through the whole organ, so that wherever an incision was made it oozed out. The veins were particularly examined, and were found quite natural. The gall-bladder was full of bile, mixed with pus. The mucous membrane of the entire alimentary canal was healthy. For this disease Dr. Olliffe proposed the name of "Purulent Catarrh of the Biliary Ducts;" and exhibited to the Section a cast, representing the condition of the liver on dissection. The cast was formed of the new material used by Dr. Felix Thibert, of Paris, which possesses all the beauty of wax, and is much more durable, under all circumstances of temperature and casual violence.

Dr. HOUSTON read a paper 'On the means adopted by Nature in the suppression of Hæmorrhage from large Arteries.'—It was not the author's intention to go into an examination, or statement, of the theories laid down on this subject, derived from experiments on the lower animals; (these experiments, although they might solve some general question, were, he observed, frequently deceptive when applied to a particular case in human pathology;) but to state accurately the appearances he found in a very remarkable case which had come under his observation and treatment. In it the entire arm had been suddenly torn off. The patient, a stout, healthy man, had been caught by a belt in a mill and thrown down with much violence; the arm which was caught was entirely removed; the man got up and walked down three flights of ladders without knowing that he had lost his limb. When removed to the hospital, the constitutional symptoms were very slight; the stump was covered with grumous blood, and was much lacerated; the nerves, particularly the median, hanging out several inches. There was no hæmorrhage, but a slight oozing. The brachial artery, when found, was tumified, smooth and soft at the extremity; strongly jerked by the pulsation of the heart, but not pouring out one drop of blood. For the prevention of fatal hæmorrhage, a ligature was applied, and subsequently amputation was performed at the shoulder-joint; on examining the artery below where the ligature was applied, the inner and middle coats were found to be retracted fully half an inch within the external or cellular coat, and the interval was filled with coagulated blood and cellular tissue in shreds. This blood Dr. Houston deemed to be perfectly fluid when it came under his observation first. The "pursed up" extremities of the inner coats retracted within the cellular sheath, he believes to have been the efficient cause of the closure, so as to prevent a fatal effusion of blood. A preparation of the artery taken from the removed stump, slit up to show the condition of the coats, and a drawing of the parts in their recent state, were exhibited to the Section.

Dr. OLLIFFE remarked, that this case confirmed the views of Amussat on the effects of the torsion of arteries, which he adopted in place of ligature in many cases.—Dr. HOWE detailed a case of similar character.

FRIDAY.

Sir J. Pitcairn in the chair.—Prof. HARRISON read a paper, 'On the Cure of Aneurism by Pressure.'—The author alluded to the danger incurred in the usual mode of treatment by ligature, notwithstanding all the improvements introduced by Hunter and Scarpa; it was most desirable that another less hazardous mode should be adopted. He wished to bring before the Section a case of successful treatment by pressure. This mode, he was aware, was not new, but he abstained from the attempt to arrest completely the circulation in the aneurismal sac, which attempt caused the very danger arising from ligature—namely, inflammation and sloughing; in the revival of this method, the object was by restraining the flow of blood through the sac, without interfering with the collateral circulation, to gradually fill the sac with a coagulation, and thus procure its obliteration, while the collateral circulation becoming enlarged by degrees, the limb will be supplied with its necessary quantity of blood. On this principle four cases had been successfully treated this year in Dublin, the last of which having been under his care, he laid it before the Section. The learned Professor then detailed the case at length from the 9th of May, when it first came under treatment, to the 10th of August, when the disease appeared to be completely removed. The instrument at first used, was that described by Dr. Bellingham in the *Dublin Medical Journal*. The pressure was made in the groin (the case being one of popliteal aneurism), and kept applied for about an hour, at intervals, its degree being regulated by the patient himself. In the progress of the case the instrument was obliged to be changed, and one known by the name of L'Estrange's tourniquet was applied at a different point on the limb, but this becoming irksome, a modification of the Carpenter's clamp, suggested by the patient himself, was used, and continued until the aneurismal swelling subsided, and all pulsation had disappeared. The collateral circulation appeared well established, and the motions of the limb were unimpeded and free from pain. Although the symptoms of the disease had disappeared, Prof. Harrison had recommended the instrument to be continued for some time.

Dr. OLLIFFE said, that this mode of treatment was proposed about a century ago by an Italian surgeon, and had been adopted with some modification by M. Amussat, who applied a torsion process on the artery, exposing it, if necessary. In answer to the inquiry of a member, Dr. Olliffe said, he was not aware of any such operation having proved successful.—Dr. WOODROOFFE having witnessed Prof. Harrison's case, could bear testimony to the completeness of the recovery, and it was the more gratifying as the patient was naturally of a very excitable circulation; the sudden walking across the ward in which he lay, the slightest mental anxiety, would bring on a return of the pulsation, at a time that it seemed quite controlled by the instrument: from this circumstance he was induced to believe, that this was a case of such a character, as to warrant the highest expectations of its general applicability.—Dr. HOUSTON requested to know what was Prof. Harrison's opinion as to the

Digitized by Google

pathological changes that occurred in the sac during its obliteration. In reply, Dr. Harrison stated, that he had avoided making any statement which must be mere matter of theoretical opinion; fortunately, in these cases there had been no *post mortem* examination, from their uniform success, but he believed the sac became obliterated from both the coagulation of the blood, and from its contraction after the distending force of the circulation was removed.—Dr. BEVAN suggested, that the coagulation of the blood during the pressure might be assisted and promoted by the passing of slight galvanic shocks through the sac.

Dr. PICKELLS read a paper, 'On the deleterious effects of Œnanthe Crocata.'—This plant, he observed, was known to be one of the virulent poisons of the indigenous British Flora, but was stated to be very rare in Great Britain by Dr. Smith, in the letter-press of 'Sowerby's Botany'; this was by no means true as regarded Ireland, particularly in Cork, and other southern counties, in which it grows in great abundance. Dr. Pickells collected nearly thirty cases of death by eating the root, the quantity in one instance not exceeding "the top of the finger"; he described the symptoms as exhibited by those cases,—insensibility, convulsions, locked jaw, delirium, and insanity; and pointed out the proper mode of treating such cases, by detailing several which were cured by the exhibition of strong emetics, diffusible stimulants, enemata, &c. He concluded by making some observations on the poisons used by the ancients in judicial executions; he thought that this might have been the plant used to destroy Socrates, and not the *conium maculatum* of modern botany, and from the symptom of insanity, he thought, that this was the plant designated as the "insane root" by the poet. This plant, Dr. Pickells stated to be equally injurious to black cattle and horses, as to man; he believed there was no direct antidote known; melted butter was given in some of the cases which recovered, and is popularly deemed a preservative against its effects. The root is frequently used as a discutient external application to tumours, and many of the accidents have occurred by eating it, when gathered for this purpose.

THURSDAY.

SECTION F.—STATISTICS.

President—Sir C. LEMON, Bart.
Vice-Presidents—Major BEAMISH, Sir W. CHATTERTON.
Secretaries—Dr. W. C. TAYLOR, D. BULLEN, M.D.
Committee—The Archbishop of Dublin, The Archdeacon of Cork, Rev. Mr. Murphy, Rev. J. F. M'Namara, Sir R. Musgrave, Messrs. N. Musgrave, J. Thompson, J. Shuttleworth, H. Townsend, J. Heywood, Rev. W. Hincks, Mr. A. Abel, Sir T. Deane, Major S. Clerke, Messrs. R. Dowden, H. Biggs, The Mayor of Cork, Mr. F. Jennings, Dr. Hobart, Messrs. W. Fagan, C. Blanconi.

The SECRETARY read a paper, by the late W. Leatham, Esq. on the present infecting and demoralizing state of the lodging-houses for the travelling poor in the towns and villages of England. Sir T. DEANE and Mr. T. JENNINGS gave an equally gloomy account of the lodging-houses in the city of Cork, and expressed a hope that the legislature would interfere. Mr. DOWDEN, however, thought that it would be necessary to exercise great caution in making legal regulations, and that over-legislation for the poor was the great error of our age and country.

Major BEAMISH read a statistical report on the physical and moral condition of the working classes in the parish of St. Michael's, Blackrock, near Cork. The whole population, in April 1843, was 2,630; the number of the working classes 2,258. The workhouse is the last resource, and there are only three paupers from Blackrock in the Cork Union. The wages of the labouring men average 5*s.* 10*d.* a week. The food of the poorest labourer consists of potatoes and milk, or potatoes and salt-fish, the cost of which is about 4*s.* 8*d.* per week for a family of six. The luxurious habits of the fishermen are remarkable; in a successful season, the weekly expenditure for a family of six averages 18*s.* per week. 472 children are educated in the various schools, and 142 pay for their education, an average of 3*l.* each annually. The moral condition of the working classes is extremely good.

'Contributions to Academical Statistics: Responsions,' (Oxford) by Prof. Powell.—The following details refer solely to the first examination, called "Responsions," which takes place at the end of the first year of academical residence, and the passing of which is an indispensable preliminary for becoming afterwards a candidate for a degree, that is, in general, for continuing in the University. The column of matriculations is taken from the author's communications in the Reports of the British Association for 1839 and 1842. The number of candidates being in general greater than that of the matriculations, arises from the circumstance of many offering themselves a second, or even a third time, after failure or withdrawal on a previous occasion. The mean results may show generally the proportion of those who either failing or withdrawing at this examination, do not go through more than the first portion of their academical course. But no exact proportion can be assigned, owing to the circumstance just mentioned.

Year.	Matriculated.	Candidates for Responsions.	Passed.	Failed.	Withdrawn.
1832	377	415	308	51	56
1833	384	420	325	42	53
1834	360	379	307	29	43
1835	369	395	292	45	58
1836	369	420	311	56	53
1837	421	431	295	73	63
1838	393	489	336	107	46
1839	404	483	375	70	38
1840	396	408	326	53	29
1841	441	412	338	40	34
Mean..	391	425	321	57	47

A paper was read from Mrs. Gilbert, on the progress of the Wellingdon agricultural school; it added little to the information already contributed by that lady on her industrial schools and system of spade husbandry.

FRIDAY.

The promise of a paper by Dr. W. C. Taylor 'On the Irish Silk Manufacture,' which was to be accompanied by specimens of the finest poplins and tabinets produced by the looms of Dublin, attracted an unusually large concourse to this Section.—Dr. TAYLOR commenced by stating that the silk-manufacture was introduced into Ireland by the French refugees, whom the revocation of the Edict of Nantes compelled to abandon their country. There are no certain records for fixing the precise date when silk-weaving was commenced in Dublin, but it is generally believed that an ancestor of the present respected family of the Latouches commenced the weaving of tabinets or poplins and tabbareas in the liberties of Dublin about the year 1693. A great and fatal error was made by the new settlers in the very outset of their career; they adopted the principle of excluding the native Irish from the benefit of all the improved arts which they introduced, refusing to receive any of them as apprentices. The manufacture was consequently an exotic forcibly prevented from taking root in the soil, and deriving its support chiefly from a system of artificial patronage. So weak, indeed, was it, that, in 1733, the Irish manufacturers of silks and stuffs waited on Archbishop Boulter, who then virtually ruled Ireland, to obtain his influence in passing a law to prohibit the wearing of East India goods. In the year 1764, an act was passed to place the silk trade under the direction of the Dublin Society, as far as it extended within two miles and a half round the Castle, and the Society was empowered to make such laws and regulations for its management as they should deem necessary. It has been generally asserted, that under this system of management the silk trade attained a high degree of prosperity; in a paper furnished to the Hand-Loom Commissioners, it was stated that in the year 1775 there were 3,400 looms in Dublin in full employment. That this return is grossly exaggerated, will appear obvious from the following considerations. In the thirteen years, from 1752 to 1764, the average imports of silk into Ireland were

15,760 lb. Manufactured.
48,132 lb. Raw.
275 lb. Ribband.

In the period, from 1765 to 1777, when the bounty system was in full operation, the following were found to be the averages—

18,200 lb. Manufactured.
45,990 lb. Raw.
1,060 lb. Ribband.

That is, the imported fabrics had increased, while the raw material, to be worked up in Ireland, had diminished. This decline appears to have continued, and, in fact, we find, from Parliamentary documents, that in 1784 there were only 800 silk-weavers at work in Dublin, and that even these were not all in constant employment. In 1786 Parliament withdrew its support from the Society's silk warehouse. The trade was altogether suspended by the insurrection of 1798, and in 1800 it was deemed necessary to protect it by a duty of 10 per cent. on the introduction of foreign and British silks. Soon after this, the silk-manufacture began to be established in Lancashire and Cheshire, while in Ireland the trade was severely injured by combinations and trades-unions; several excellent workmen, unable to endure the arbitrary regulations established by these self-constituted bodies, removed to England, and, at this hour, there are more Irish than English engaged in silk-weaving at Macclesfield. In 1826 the protecting duties expired, and as the silk-weavers refused to modify their arbitary laws so as to meet the altered circumstances of the times, whole silk-weaving was destroyed as a branch of industry in Dublin. The poplin or tabinet manufacture, in which the weft is worsted, is always classed with the silk-trade in the returns made to the Irish Parliament. There are at present about 280 men and 70 women engaged in the poplin manufacture, assisted by 130 children employed in winding the bobbins or quills for the shuttles, at ages varying from 7 to 13 years. As the poplin manufacture is a very limited branch of industry, the Society of Operative Weavers has been able to maintain a fixed and uniform rate of prices for several years; and the master manufacturers generally concur in the system, because in an article of limited consumption, the use of which is exclusively confined to the wealthier classes of the community, it is of far greater importance to maintain the acknowledged superiority of the article than to produce it at a lower cost. The greatest improvements in the manufacture have resulted from the introduction of the Jacquard loom, and from a machine of recent invention for introducing a variety of colours in fancy brocading by a more effective process than that which was anciently employed. In what are called French poplins, cotton is very freely introduced, and though they are thus rendered much cheaper than the Irish, they are obviously inferior in richness and beauty, and they have been found still more so in permanence of colour and durability of material. The Irish poplins are highly esteemed abroad, and they are occasionally ordered in limited quantities for the principal continental courts, the United States of America, and the East and West Indies. Silk has not been thrown in Dublin since the year 1837; it is chiefly imported from England, and the consumption of organzine is estimated at about 18,000 lb. annually. There are about 240 poplin looms in Dublin, 20 velvets, and a few furniture tabbareas; so that the poplin may be regarded as the only branch of the silk-manufacture which has a healthy existence in Ireland. It has been already stated, that the high price of the fabric must always restrict the manufacture of poplin within what large mill-owners would consider exceedingly narrow limits, particularly as it is believed impossible to apply power successfully to this species of weaving.

A paper was read from Mr. I. CATLOW, on the natural relation between the anniversary season of birth and death, and the tendency to death in the natal month. Some strange theories of the author's prevented this paper from receiving the attention which such zeal and industry, bestowed on a more practical subject, must have commanded.

Dr. D. BULLEN read a paper on the statistics of the parish of Kilmurry, a rural district in the barony of West Muskerry, in the county of Cork, which exhibited a striking improvement in the physical and moral condition of the people, arising chiefly from the temperance movement and the great advance made in education.

The discussion which followed the reading of this paper, turned chiefly on the advantages of industrial education, and it was stated that large quantities of muslin are now sent from England to be worked in Ireland, one establishment alone paying more than 20,000*l.* annually for needlework in Ireland.

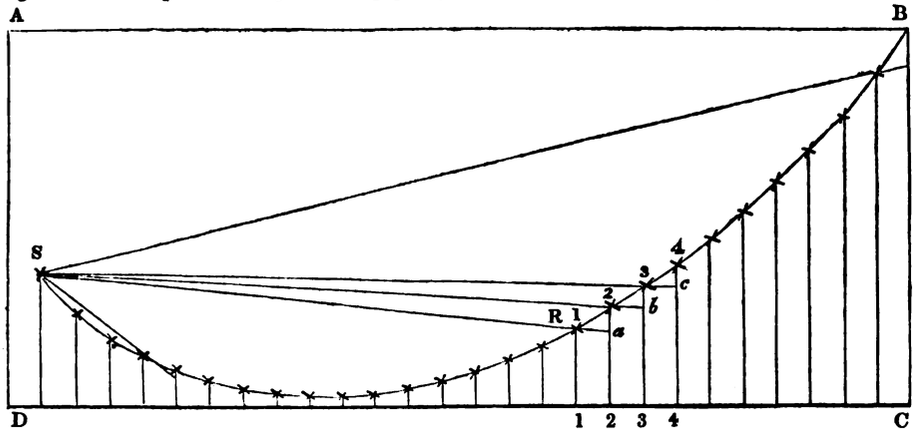
THURSDAY.



SECTION G.—MECHANICAL SCIENCE.

President—Prof. J. MACNEILL.
Vice-Presidents—Messrs. J. TAYLOR, F. G. BERGEN, Sir T. DEANE.
Secretaries—Messrs. J. THOMSON, R. MALLET.
Committee—Messrs. J. S. Russell, C. Vignolles, The Ven. Archdeacon Kyle, Messrs. J. I. Hawkins, — Chanter, W. Jessop, E. Hodgkinson, R. Taylor, J. S. Patrick, J. Perry, A. Fox, J. Wilson.

Prof. Macneill, President, in the chair.

A paper, by Mr. Ryan, 'On the Application of Water as a Moving Power,' was read. In principle, the machine described resembled Barker's mill.

Mr. SCOTT RUSSELL communicated to the Section a paper 'On the Application of our Knowledge of the Laws of Sound to the Construction of Buildings.'—The object of this paper was twofold—first, to apply our knowledge of the *known laws* of sound to the phenomena of speaking and hearing in a given building; and secondly, to develope certain *laws of sound recently discovered*, and not generally known; and to show their application to the same practical purposes. Part I. of the paper contained the application of the *known laws* of sound to the construction of buildings. The author prefaced this part of the paper by describing a form of building which had been found to be perfectly adapted to the purpose of seeing and hearing with distinctness and comfort. This arrangement of buildings had been described by him in a paper communicated to the Royal Society of Arts of Scotland some years ago, but had not been actually constructed on a large scale until lately, when a young architect, Mr. Cousins, of Edinburgh, having been employed to construct some large buildings, and alighting on this paper, adopted its principles. Buildings were now erected on this principle, and contained from fifteen hundred to three thousand people, whom they accommodated without difficulty, and with perfect comfort both to speaker and hearer. He had little doubt, from experiments he had recently made, that so many as ten thousand people might be so arranged as to hear with ease and comfort a good speaker. Mr. Scott Russell's principle of construction is to place the speaker in the focus of a curve, which he calls the curve of equal hearing, or the isacoustic curve; and to place the seats of the auditors in such a manner that their heads shall all be arranged in this curve.

Let A B C D represent the vertical section of a building for public speaking, S the height of the speaker on his platform, D C the floor of the building: then, for the purpose that all the auditors should hear and see equally well, they should be placed on the line S R B of the acoustic curve. This curve is constructed in the following manner: D C is first divided into equal parts, to represent the usual breadth of a sitting, and vertical lines are drawn through these points. R being the place of the auditor 1; the place of auditor 2 behind him is assigned thus—join S R, and produce it to *a*—from *a* upwards set off *a* 2 = 9 inches, and 2 is the proper height of the next spectator. Then join S 2, produce it to *b*, and set off *b* 3 = 9 inches, and 3 is the place of the third spectator; and so on for the place of every spectator. Such was the vertical section of the building. The horizontal section was either circular or polygonal, having the speaker at the centre. This form had been found perfectly successful in affording the highest degree of comfort both to hearer and speaker; therefore he submitted it with confidence to the Section, as a practical and established principle, more than as a mere theoretical speculation. The remainder of this paper was then adjourned till the next day.

Mr. H. DIRCKS read a paper on the construction of Luntley's Shadowless Gas-burners, and the shape of Glass Chimneys for Lamps. The object of the burner was to bring the gas issuing from the small orifices into direct contact with atmospheric air at the ordinary temperature. Mr. Dircks contended that the heating of the air previously to its combustion diminishes the brightness of the flame; because, while each volume of carburetted hydrogen gas requires ten volumes of atmospheric air for its perfect combustion, the expansion of the air by heat necessarily reduces the weight of oxygen contained in the same volume of air; and therefore, unless some means be adopted of increasing the supply of air, the oxygen would be deficient. Another alleged advantage of the burner arises from the small quantity of metal through which the orifices are perforated, for by that means a smaller quantity of heat is abstracted in burning. The peculiarity in the form of the glass chimney consists in having the upper end enlarged. The effect of this enlargement, Mr. Dircks said, was to open the top of the flame and increase its brightness.

Mr. J. TAYLOR explained to the meeting the recent improvements of Dr. Faraday in the combustion of gas; and a short discussion arose, in which Mr. Hawkins and Dr. Scoresby took part, on the advantage of enlarging the upper ends, not only of glass chimneys, but of all chimneys for the combustion of fuel.

EVENING MEETING.—THURSDAY.

COL. SABINE opened the proceedings by apologizing for the absence of Lord Francis Egerton, who was detained by sickness in England; and he proposed that the Marquis of Northampton should take the chair; he was the long-tried friend of the British Association, and ever ready to give his services in the cause of science.

The Marquis of NORTHAMPTON having taken the chair, and after dwelling at some length on the merits of the Earl of Rosse, as a cultivator of science, introduced him as President to the meeting.

The Earl of ROSSE then took the chair; and, after a short delay, rose to deliver the annual address. He said,—

I am sure no one can feel more sensible of the kindness of my noble friend, in condescending to notice my very humble exertions in the cause of astronomical science, and no one more conscious that the compliment so flattering is undeserved, and, I must say, that I should be but too happy were it now in my power to resign into his abler hands those duties which have just devolved upon me; for in that case I am sure the Association would have nothing to desire. But as that is impossible, and as it has been of late the practice for those who have occupied the position in which I find myself most undeservedly placed, to offer a few observations on the objects of the Association at the first General Meeting, I feel I have no other course but to solicit, most earnestly, your kind indulgence. Such a request you would not perhaps consider unreasonable from any one who laboured under the embarrassment necessarily arising from the consciousness of his own inability adequately to discharge the duties intrusted to him, augmented, as it must be, tenfold, by that awe which it is impossible not to feel in the presence of men the most distinguished in the varied departments of human knowledge. But perhaps, in this instance, your kindness will allow there is an additional claim to your indulgence. This very embarrassing position is not of my own seeking. To have aspired to the high honour of presiding at one of your meetings, would have been an act of presumptuous vanity which I never did, which I never could have contemplated. A communication from Manchester, announcing that the Association had actually made their selection, was the first intimation which reached me that my name had even been thought of. Under such circumstances, to have declined the honour, and to have shrunk from the responsibility, would, in my opinion, have been inconsistent with proper respect: it remained, therefore, but to endeavour to do the utmost, trusting that your kindness would overlook all omissions, and that the vigilance of the many most able men who guide the proceedings of this Association would detect and correct all important errors. But, however arduous the task, however painful the duty of addressing a meeting so constituted as this is, it is impossible not to participate in the gratification which all must feel in seeing so many men of eminence assembled to assist each other in promoting objects of such deep and general interest. The man of the world who, busied in the changing scenes of life, watches with fixed attention the actions of men, while he occasionally perhaps casts a passing glance at science as it happens to present to him some new wonder—he cannot fail to look with surprise, and, I may add, with gratification, at a meeting so large, (and in this country too,) from which politics are altogether excluded. Here he will see no angry conflict of passions, none of that feeling of bitterness and animosity, which never fails to attend the contests between man and man, between different classes in the same country, or between different nations: all proceeding from the same cause, or nearly so—a struggle for power; in other words, a struggle for dominion over man, and through him over the material things of this world. But in such a contest, what is gained on one side must be lost on the other. Here, on the contrary, however much may be gained, there can be no loss to any one. This is no paradox; for here the object of the contest is to increase man's knowledge, and with it at once his power over the material things of this world. It is plain, therefore, that in the objects we have in view, all have an equal interest; that the contest we are engaged in is one of friendly rivalry, all competing in their efforts to promote that knowledge, that science, which has been given to us as the reward of industry, and by which the gifts of a bountiful Providence may be increased and improved, for the benefit of man, to an extent almost unlimited.

But, Gentlemen, there are, perhaps, many here who have not been present at other meetings of the Association, who know nothing of the objects actually accomplished by it, and who are not acquainted with the records of its proceedings annually published. The question, therefore, may be asked, Does this Association actually promote the advance of science, and if so, by what means?

For a complete, detailed, and triumphant answer to such a question, I must refer to the printed Reports of the proceedings. It would be unpardonable on my part to take up your time in endeavouring to perform a task, no doubt imperfectly, which has been achieved in the most complete manner by the very able men who, on former occasions, have undertaken it. I shall, therefore, only mention that original researches in various departments of science, and on a great scale, have been carried on by the Association, upon which large sums have been expended under the most skilful management, and with very important results. The sum so expended exceeds 8,000*l*. Much also has been accomplished for science by the resources of the State, applied under the advice of the Association; and within a few days it has been officially announced that the sum required for an important astronomical object, the publication of the Observations of Lacaille and Lalande, has been granted by Government.

For the previous reduction of the observations we are indebted to the zeal, ability, and public spirit of Mr. Baily and Mr. Henderson, two members of the Association, who gave their services gratuitously,

Digitized by Google

and took upon themselves the laborious duty of superintending the work. The actual expense incurred, amounting to 1,400*l.*, was defrayed out of the funds of the Association.

I am also happy to be enabled to announce, that with respect to another great undertaking you all have heard of, which has been carried on at the public expense, under the gratuitous superintendence of a distinguished philosopher,* a most favourable notice has been published by a foreign geometrician of eminence: that notice, or essay, perhaps I should call it, will appear translated in the next number of the Scientific Memoirs. I regret I have not been able to procure a copy of the original essay, and therefore cannot say anything more precise about it; still I cannot refrain from mentioning it as a subject of much interest in the scientific world. In addition to the researches carried on by the Association, much has been done to aid research. A very important series of papers has been written and published in the annual volumes, under the head of "Reports on Researches in Science." Each of these Reports is, in fact, a complete and accurate general view of the actual state of that science, or branch of science, to which it refers, briefly, but profoundly, touching upon every point of interest, so that the man about to undertake the task of endeavouring to advance any particular branch of science may at once, by referring to one of these Reports, know where to look for that information which is indispensable to success, namely, an exact knowledge of all that has been done by others.

These Reports are so numerous, and embrace so wide a field, that to give any analysis of them within reasonable limits, would be impossible; and to form an adequate estimate of their importance, it is absolutely necessary to examine them in detail, just as they have been published. However, it appears to me, that without presupposing any knowledge whatever of these matters, or of the past history of this Society—without assuming that it has in any one instance effected, by joint co-operation, important and laborious researches in the cause of science, still that, even to a person who will not take the trouble of inquiring and informing himself, an answer to the question, Does the Association advance science? may be returned, short but conclusive. The answer I should give would be this: I appeal to the experience of every man at all conversant with the history of science, and with the working of scientific societies, whether it is not an indisputable fact, proved by experience, that all such societies, when properly conducted, are powerfully instrumental in promoting the advance of science.

Unfortunately, it sometimes happens, that when a new society springs up, it in some degree interferes with a society previously existing. This Association, however, interferes with no other society, and therefore, setting aside the great objects actually accomplished, far beyond the pecuniary resources of other societies, and for which I take no credit, because I presume for a moment they are unknown, it appears to me, nevertheless, to follow irresistibly, that this Association, acting precisely as other learned societies do—using the same means, and exerting a similar indirect influence, must likewise, just as they are, and on a scale just proportioned to its magnitude, be eminently useful in urging on the advance of science.

It may, perhaps, be worth while to inquire for a moment in what way the associations of scientific men promote science. The inquiry, however, cannot alter the fact that they do so, for that fact is based on experience. There are many and very obvious ways in which they do so. I shall mention but one.

The love of truth; the pleasure which the mind feels in overcoming difficulties; the satisfaction in contributing to the general store of knowledge; the engrossing nature of a pursuit so exalted as that of diving into the wonders of the creation; all these are very powerful incentives to exertion; and under their influence great works have been undertaken in the cause of science, and carried through to a successful termination; but I believe few will be disposed to deny that further inducements must be highly useful.

Let it be for a moment recollected, that where any, even the most trifling, step in advance has been gained, except, perhaps, the accidental discovery of a simple fact, there has usually been a long and laborious course of previous preparation. It has been necessary, even in the more popular sciences, to know accurately, first, what had been done by others; to see distinctly the boundary line between the known and the unknown, before there was the least chance of effecting anything; and in the higher departments of science such is the time to be expended, so great the toil to be endured in ascending to that elevation, from which the difficulties to be encountered but just begin to appear, that the task is one to which the undivided energies of man exerted for many years are no more than commensurate.

But the necessary preparations accomplished, then the real difficulties commence. Some perhaps apparently new principle suggests itself; it is followed, with great expenditure of time and labour, to its remote consequences, and it turns out to be perfectly barren and worthless.

One disappointment succeeds another, and years of toil pass away and no result. Under these trying circumstances the associations of scientific men afford their friendly aid; they soothe disappointment, excite hope, and prepare the way for redoubled exertion: they call into active existence that principle which has been implanted in our nature for the noblest purposes—the legitimate ambition of meriting and receiving the approbation of our friends and associates. In the ordinary circle of acquaintances, the man engaged in scientific pursuits will find very few, if any, who can understand and appreciate his labours; but in such associations as this, there are always many who see exactly the object aimed at, the difficulties to be encountered, and who are ready to acknowledge with gratitude every successful effort in the cause of science.

It is thus, without having recourse to other considerations, that I account for the fact, that the associations of scientific men, even when they employ no large funds, and perform no gigantic labours, as this society does, still, by their indirect action, accelerate very greatly the progress of scientific discovery.

But this Association performs other important services. It appears to me to diffuse over scientific inquiry (if I may so express myself) a salutary influence—a healthy vigour of action. What more calculated to dispel that feeling of languor and weariness, the consequence of excessive mental labour long continued, than the freshening excitement of an interchange of ideas with men to whom the same course of research had long been an object of interest? What more likely to extinguish any petty jealousy which might arise,—and scientific men, like other men, have their weaknesses sometimes,—than to bring all the parties together in friendly intercourse, where they cannot but feel they have a common object, and are working in a common cause—the discovery of truth?

Again: should the mind, pursuing in retirement some single scientific object, raise up to itself notions exaggerated and unreal, of the importance of that object, and then, elated and misled by some trifling success, should it throw off the garb of humility, the characteristic of science pursued in a proper spirit, what more calculated to dispel the illusion than these meetings, where the man, however eminent in that branch of science to which he may have devoted his almost exclusive attention, will be sure to find others immensely his superior in every other department of human knowledge? And it is not merely for the sake of individuals engaged in the pursuit of science that these consequences are so valuable; it is also for the sake of science itself.

It is important that science should stand before the world in an aspect which is not forbidding, and we may rest assured of this, that wherever there may be the least trace of petty jealousy, of prejudice, or of pride, the world will not be slow to discover it; and as science claims as one of its noblest attributes, the power of exalting and enlarging the mind, and of arming it against such weaknesses, it will thus be exposed to the charge of having preferred pretensions to which it has no just title.

I will not detain you by enlarging upon the other obvious beneficial consequences of these meetings, such as the opportunities they afford for the free discussion of questions upon which the concentrated knowledge of individuals may be brought to bear with so much success—the opportunities they afford for the formation of new friendships between scientific men, often fraught with consequences very important to science, and the necessary tendency of them to encourage a taste for science. Upon all these I will abstain from offering any observations. There is, however, one consequence of these meetings, to which, if you will permit me to detain you a moment longer, I will just advert.

It has been remarked by a modern traveller of considerable depth of observation, that he had always found in the children of the fields a more determined tendency to religion and piety, than amongst the dwellers in towns and cities, and that he conceived the reason to be obvious—that the inhabitants of the country were less accustomed to the works of man's hands than to those of God. May not the observation be of more extensive application than at first sight appeared? and if it be true that where we dwell constantly in large cities the mind is liable to be led astray by the habitual contemplation of the works of man, forced upon it imperceptibly by the continual succession of ideas—all of the same character—all originating in objects which have been shaped and fashioned by man, may it not also be true that it is equally liable to be led astray where it concentrates its whole attention, and exerts its whole energy without relaxation in the contemplation of the greatest of all human works, that which the labour of so many centuries has raised up—the structure of the abstract sciences? And if that be so, what more calculated to unbend the mind, and to divert for a season the current of ideas into other channels, than these periodical meetings, where, in the proceedings of every section, matter will be found of the deepest interest to every true philosopher; and where, however dissimilar the facts, however varied the inferences, the result will everywhere be still the same—that of putting forward more prominently in bold relief the wonderful works of creation? It appears to me, if I may presume to offer an opinion on such a subject, that the continual progress of discovery is destined to answer objects far more important than the mere improvement of the temporal condition of man. Were there a limit to scientific discovery, and had we reached that limit, we should be in the condition of a man who, with the most splendid landscape before him, was insensible of its beauty because the charm of novelty had passed away. Each successive discovery, as it brings us nearer to first principles, opens out to our view a new and more splendid prospect, and the mind, led away by its charms, is carried beyond and far above the petty and ephemeral contests of life: but the more rapid the discoveries are, the more powerful the charm, and therefore great is the motive for exertion; and in labouring in this cause there is this gratifying reflection, that our labours cannot injure our successors, for the region of discovery is rich beyond the powers of conception; and however much we may draw from it we shall not leave its treasures exhausted—no, not even diminished, because they are infinite. This Association has already accomplished much; I feel persuaded it will accomplish much more; but of this we may rest assured, that however long it may endure, and I see no principle of endurance which other societies have that is here wanting, it will find an ample and an enlarging field of useful employment.

The Treasurer then read the Annual Report of receipts and expenditure, as follows:—

TREASURER'S ACCOUNT,
From the 23rd of June, 1842, to the 14th of August, 1843.

RECEIPTS.	£.	s.	d.

Sir W. HAMILTON proposed the thanks of the Irish people to the British Association, for having visited the country, which being carried by acclamation, R. I. MURCHISON, Esq. replied, and in turn proposed a vote of thanks to the local officers for the excellence of their arrangements. In acknowledging this vote, the MAYOR OF CORK lamented the apathy exhibited by the gentlemen of the county of Cork, who had not shown that interest in the Association, which the value of its labours and their own position as country gentlemen ought to have suggested.

GENERAL COMMITTEE.

MONDAY.

Invitations, not to be pressed unless circumstances required, were presented from Derby and Hull, but it was generally known that all parties had agreed to hold the next meeting at York; and a resolution to this effect was passed by acclamation. The following noblemen and gentlemen were elected office-bearers for the next year:—

Rev. J. Peacock, Dean of Ely, *President*.—Earl Fitzwilliam, Viscount Morpeth, J. S. Wortley, Esq., Sir D. Brewster, Prof. Faraday, Rev. Vernon Harcourt, *Vice-Presidents*.—W. Hatfield, Esq., Rev. Mr. Scoresby, — Meynel, Esq., W. West, Esq., *Secretaries*.—W. Gray, Esq., *Local Treasurer*.

It was resolved, that the meeting should be held in the course of September, the particular day to be determined by the London Council. The following gentlemen were appointed to the Council for the ensuing year:—Sir H. de la Beche, Dr. Buckland, Dr. Daubeny, Prof. T. Graham, G. B. Greenough, Esq., Leonard Horner, Esq., Eaton Hodgkinson, Esq., Robert Hutton, Esq., Sir Charles Lemon, C. Lyell, Esq., Prof. Lloyd, D. Macneill, Esq., Prof. M'Cullagh, the Marquis of Northampton, Prof. Moseley, Dr. Richardson, Prof. Sedgwick, Col. Sykes, W. Thompson, Esq., Prof. Wheatstone, Rev. Mr. Whewell, and Dr. Williams, with the officers of the Association.—The General Secretaries and Treasurer were re-elected.

To CORRESPONDENTS.—P. C. B.—E. F.—H. K. W.—received.

W. C. had better write to the Commissioners.

The following Periodical Works, for SEPTEMBER, 1843, will be published by Charles Knight & Co.

THE PENNY MAGAZINE, Part XXXII. (New Series,) price 6*d*.

KNIGHT'S CABINET EDITION of SHAKSPERE, Vol. VIII., bound in cloth, with gilt edges, price 2*s*. 6*d*. To be completed in Ten Volumes. Published also in Weekly Numbers, each containing a separate Play, price 6*d*.

THE PICTORIAL HISTORY of ENGLAND, during the REIGN OF GEORGE III., Part XXXII., super-royal 8vo. price 2*s*.

LONDON, Part XXX., price 1*s*. 6*d*. (completing the Fifth Volume), Published also in Weekly Numbers, price 4*d*.

THE PENNY CYCLOPÆDIA, Part CXXVII., 1*s*. 6*d*.

THE PICTORIAL MUSEUM of ANIMATED NATURE. Part VIII., price 1*s*. To be completed in Twenty-five Parts. Published also in Weekly Numbers, price 3*d*.

THE GUIDE TO SERVICE.—The FARM BAILIFF, 1*s*. 6*d*.

LONDON, Volume V., handsomely bound in cloth, price 10*s*. 6*d*.

WILLIAM SHAKSPERE; a BIOGRAPHY. By C. KNIGHT. Being the Eighth and concluding Volume of the PICTORIAL SHAKSPERE. In cloth, uniform with the Plays. Price 1*l*. 5*s*.

22, Ludgate-street, August 21, 1843.

8, New Burlington-street, August 26, 1843.

MR. BENTLEY HAS JUST PUBLISHED
THE FOLLOWING NEW WORKS:

I.

New Work by the Author of 'The Pilot,' 'The Spy,' 'The Jack O'Lantern,' &c.

In 3 vols. post 8vo.

WYANDOTTE; or, THE HUTTED KNOLL. A Romance.
By J. FENIMORE COOPER, Esq. (Just ready.)

II.

Hudson's Bay Company.

In 1 vol. 8vo. with Maps by Arrowsmith.

NARRATIVE OF THE DISCOVERIES ON THE NORTH COAST OF AMERICA;
EFFECTED BY THE OFFICERS OF THE HUDSON'S BAY COMPANY, during the Years 1836–39.
By THOMAS SIMPSON, Esq.

III.

In 3 vols. post 8vo.

THE BUSY BODY; a Novel.

IV.

Now first published,
2 vols. 8vo. with Portraits from original Paintings, &c.

LETTERS OF HORACE WALPOLE,
EARL OF ORFORD,
TO SIR HORACE MANN, H.B.M. Resident at the Court of Florence, from the year 1760 to 1786.
Printed from the Original MSS.
Concluding Series.

V.

In 2 vols. post 8vo. revised and corrected by the Author,

SECOND EDITION OF
SLICK IN ENGLAND; or, THE ATTACHÉ.
By the Author of 'The Clockmaker; or, Sayings and Doings of Sam Slick of Slickville.'

VI.

2 vols. 8vo. with Portraits.

GEORGE SELWYN AND HIS CONTEMPORARIES,
with MEMOIRS and NOTES.
By J. HENEAGE JESSE, Esq.
Author of 'Memoirs of the Court of England under the Stuarts,' and 'The Court of England under the Houses of Nassau and Hanover.'

VII.

In 3 vols. post 8vo.

THE CIRCASSIAN CHIEF; a Romance of Russia.
By WILLIAM H. G. KINGSTON, Esq.

ALSO, JUST READY:

2 vols. 8vo. with Portraits,

CONCLUDING VOLUMES OF
GEORGE SELWYN AND HIS CONTEMPORARIES,
WITH MEMOIRS AND NOTES.
By J. HENEAGE JESSE, Esq.
Author of 'Memoirs of the Court of England under the Stuarts,' and 'The Court of England under the Houses of Nassau and Hanover.'

Richard Bentley, New Burlington-street,
(*Publisher in Ordinary to Her Majesty.*)

On Monday next, the 28th of August, will be published, price 7*s*. bound in cloth,

WITTICH'S LEXICON to HOMER, for Schools and the Junior Classes in Colleges.
London: Simpkin, Marshall & Co. Stationers'-hall-court.

THE HOME TREASURY OF BOOKS, PICTURES, TOYS, &c., PURPOSED TO CULTIVATE THE AFFECTIONS, FANCY, IMAGINATION, AND TASTE OF CHILDREN.
EDITED BY FELIX SUMMERLY.

Works now ready:

BIBLE EVENTS, WITH PICTURES BY HOLBEIN. 4*s*. 6*d*. AND 2*s*. 6*d*.

TRADITIONAL NURSERY SONGS, WITH 8 NEW PICTURES. 4*s*. 6*d*. AND 2*s*. 6*d*.

LITTLE RED RIDING HOOD, WITH 4 NEW PICTURES. 3*s*. 6*d*. AND 2*s*.

SIR HORNBOOK: AN ALLEGORICAL BALLAD, WITH EIGHT PICTURES. 4*s*. 6*d*. AND 2*s*. 6*d*.

Works in preparation:

THE PLEASANT HISTORY OF REYNARD THE FOX, TOLD IN THE PICTURES: EVERDINGEN. 4*s*. 6*d*.

BALLAD OF CHEVY CHASE, WITH FOUR NEW PICTURES. 3*s*. 6*d*. AND 2*s*.

BEAUTY AND THE BEAST, WITH FOUR NEW PICTURES. 3*s*. 6*d*. AND 2*s*.

TESSELATED PASTIME, WITH NUMEROUS PATTERNS. 6*s*. AND ABOVE.

JACK AND THE BEAN STALK, A NEW EDITION, WITH 4 NEW PICTURES. PRICE 3*s*. 6*d*. AND 2*s*.

BOX OF TERRA COTTA BRICKS, GEOMETRICALLY MADE. 10*s*. 6*d*. AND UPWARDS.

LONDON: JOSEPH CUNDALL, 12, OLD BOND-STREET.

RECREATION HAND-BOOK GUIDES
By FELIX SUMMERLY.
[See more explanatory Advertisement in last *Athenæum*.]

HAND-BOOK for HAMPTON COURT PALACE; or, Guide to the Architecture, Tapestries, Paintings, Gardens and Grounds of Hampton Court: with numerous Embellishments on Wood, engraved by Ladies, Maps and Plans from Official Sources, and bound in a Cover designed by Holbein for Cardinal Wolsey. Price 5*s*. in cloth, and Holbein's cover in gold, with Maps and Plans; and 2*s*. 6*d*. not gilt, and without Maps.
"Decidedly the best Popular Guide to the Picturesque Beauties of Hampton Court."—*Spectator*.

Hand-Books for the National Gallery. Price 6*d*., 3*d*., and 1*d*.

Also, now ready,

An Illustrated Edition, with Reminiscences of the most celebrated Pictures, drawn expressly from the Originals by Messrs. John James and William Linnell.

Hand-Book for Free Picture Galleries; being a Guide to all the Pictures in the National Gallery, the Dulwich Gallery, the Soane Museum, the Society of Arts, and the British Museum. Price 1*s*. 6*d*. Each Gallery published separately at proportionate prices.

Hand-Books for Westminster Abbey: a Guide to the Architecture, Sculptures, Tombs and Decorations, with 56 Embellishments on Wood, engraved by Ladies, 4 Etchings, a Specimen of Encaustic Tiles in the Chapter House, and an Illumination. Price 7*s*. Another Edition, without Tiles and Illumination, 3*s*.

Abridged Edition, with 4 Etchings, price 1*s*.

———, with Plan of the Abbey, 6*d*.

A Glance at the Temple Church, with Eight Illustrations and Ornamental Borders printed in three Colours. Price 1*s*. Second Edition.

Hand-Book for Holidays; or, Guide to the London Sights, price 6*d*.

A Hand-Book for Canterbury, with 35 Illustrations, 3*s*. 6*d*.; cloth extra, 5*s*. 6*d*.

Just published, Days' Excursions out of London; to Erith, Rochester, and Cobham: with a Catalogue of the Pictures at Cobham Hall. Maps and Illustrations, price 2*s*. 6*d*.

UNIVERSAL LIFE ASSURANCE SOCIETY,
1, KING WILLIAM-STREET, LONDON.
Directors—Sir Henry Willock, K.L.S. *Chairman*.
John Stewart, Esq. M.P. *Deputy Chairman*.

Major-Gen. Sir Rd. Armstrong, C.B. K.C.T. & S.	William Kilburn, Esq.
John Bagshaw, Esq.	Francis Macnaghten, Esq.
Augustus Bosanquet, Esq.	Charles Otway Mayne, Esq.
Charles Dashwood Bruce, Esq.	Robert Saunders, Esq.
Ellis Watkin Cunliffe, Esq.	James Duncan Thomson, Esq.
Raikes Currie, Esq. M.P.	Capt. Samuel Thornton, R.N.

The principle adopted by the Universal Life Assurance Society of an annual valuation of assets and liabilities, and a division of *three-fourths of the profits* among the assured, is admitted to offer great advantages; especially to those parties who may wish to appropriate their proportion of profit to the reduction of future premiums.
The following table will show the result of the last division of profits, as declared on the 10th of May, 1843, to all persons who had on that day paid six annual premiums:—

Age when Policy was issued.	Date of Policy.	Sum Assured.	Original Premium.	Reduced Annual Premium.
20	On or before 10th of May, 1839.	£1,000	£19 6 8	£9 13 4
30		1,000	24 8 4	12 4 2
40		1,000	31 10 0	15 15 0
50		1,000	43 15 0	21 7 6
60		1,000	66 11 8	33 5 10

(By order of the Board)
DAVID JONES, Actuary.

ACHILLES BRITISH and FOREIGN LIFE ASSURANCE ASSOCIATION, No. 24, Lombard-street.

Loans granted to Policy Holders.

Every description of Life Assurance may be effected, upon a moderate scale of premium, either with or without participation in profits.

Endowments for Children or Widows, and immediate or deferred Annuities, granted upon fair and equitable terms.

Loans may be obtained on personal or other security by individuals Assuring their lives with this Association.

Risks taken on the Lives of Master Mariners and Passengers by sea, either for the whole term of life, or for the voyage.

EDWARD GILBERTSON, Secretary.

Prospectuses, and every other information, may be obtained by applying at the Offices, No. 24, Lombard-street, City.

GLOBE INSURANCE,

PALL MALL and CORNHILL, LONDON.

Edward Goldsmid, Esq. *Chairman.*
William Tite, Esq. F.R.S. *Deputy Chairman.*
George Carr Glyn, Esq. *Treasurer.*

Established 1803.

For FIRE and LIFE INSURANCE, and ANNUITIES, and the PURCHASE of REVERSIONS and LIFE CONTINGENCIES.

CAPITAL, ONE MILLION STERLING.

The whole paid up and invested, and entirely independent of the amount of premiums received.

Rates and Conditions of Fire and Life Insurance, or other information, may be obtained at the Offices in London, and of the Company's Agents in the Country; and where Agents are not appointed, persons in active life, and desirous of the appointment, may apply to the Secretary.

By order of the Board,
JOHN CHARLES DENHAM, Secretary.

London, August, 1843.

THE uncertainty of life ought strongly to influence those who have relatives and families dependent on them, to have recourse to the benefits of Life Assurance, no less as a matter of duty than of interest. The following actual cases quoted from the books of the SCOTTISH WIDOWS' FUND LIFE ASSURANCE SOCIETY will place in a very strong view, not only the ORDINARY BENEFITS of Life Assurance, but also the very great advantages derived from a connexion with this Society.

Age at Entry.	Date of Assurance.	Date of Decease.	Interval between Assurance and Decease. Years.	Mos.	Original sum Assured.	Amount of Additions by way of Bonus.	Total Sum paid.
43	1815, Jan.	1837, Feb.	22	1	£500	£258 16 1	£758 16 1
55	1816, Mar.	1834, Nov.	18	8	100	45 9 11	145 9 11
51	1817, Nov.	1831, Apr.	13	5	500	186 14 0	686 14 0
65	1818, June	1832, Apr.	13	10	800	313 16 9	1113 16 9
53	1821, Mar.	1835, Dec.	14	10	885	207 17 9	1092 17 9
36	1822, Apr.	1832, Oct.	10	6	1500	250 17 6	1750 17 6
25	1823, Dec.	1832, Dec.	9	..	2500	380 1 3	2880 1 3
40	1830, May	1830, Dec.	..	7	500	....	500 0 0
33	1832, Mar.	1832, Apr.	..	1	1000	....	1000 0 0

The Profits at 31st December, 1838 were sufficient to secure, I. A RETROSPECTIVE BONUS OF TWO PER CENT. PER ANNUM, not only on the original Sum assured, but likewise on the BONUS ADDITIONS PREVIOUSLY DECLARED. II. A CONTINGENT PROSPECTIVE BONUS OF TWO PER CENT. PER ANNUM on the accumulated amount of the original sum assured, and the Bonus Additions previously declared—to be paid from 31st December, 1838, on all Policies of 5 years' standing that may emerge before 31st December, 1845.

All information may be obtained on application at the Head Office, or at any of the Society's Agencies.

JOHN MACKENZIE, Manager.

LONDON OFFICE, 7, Pall Mall.
HUGH M'KEAN, Agent.

BRITANNIA LIFE ASSURANCE COMPANY, 1, Princes-street, Bank, London.

This Institution is empowered by *Special Act of Parliament*, (4 Vict. cap. 9), and is so constituted as to afford the benefits of Life Assurance in their fullest extent to Policy-Holders, and to present greater facilities and accommodation than are usually offered by other Companies. The decided superiority of its plan, and its claim to public preference and support, have been proved incontestibly, by its extraordinary and unprecedented success.

Assurances may either be effected by Parties on their own Lives, or by Parties interested therein on the Lives of others.

The effect of an Assurance on a person's own life is to create at once a property in reversion, which can by no other means be realized. Take, for instance, the case of a person at the age of thirty, who by the payment of 5*l.* 3*s.* 4*d.* to the Britannia Life Assurance Company, can become at once possessed of a bequeathable property, amounting to 1000*l.*, subject only to the condition of his continuing the same payment quarterly during the remainder of his life,—a condition which may be fulfilled by the mere saving of RIGHT SHILLINGS weekly in his expenditure. Thus, by the exertion of a very slight degree of economy—such, indeed, as can scarcely be felt as an inconvenience, he may at once realize a capital of 1000*l.*, which he can bequeath or dispose of in any way he may think proper.

Detailed Prospectuses, and every requisite information as to the mode of effecting Assurances, may be obtained at the Office.

PETER MORRISON, Resident Director.

A Board of Directors attend daily at 2 o'clock, for the dispatch of business.

WESTERN LIFE ASSURANCE SOCIETY, 49, Parliament-street, Westminster.—Capital 500,000*l.*

Directors.

Henry Edgeworth Bicknell, Esq.
William Cabel, Esq.
Thos. Somers Cocks, jun. Esq.
George Henry Drew, Esq.
William Evans, Esq.
William Freeman, Esq.
Francis Fuller, Esq.
James Hunt, Esq.
John Arscott Lethbridge, Esq.
Edmund Lucas, Esq.
George Kennet Pollock, Esq.
James Lys Seager, Esq.
John Bazley White, Esq.
Joseph Carter Wood, Esq.
Henry Wrench, Esq.

Physician—William Richard Basham, M.D.
Surgeons—Alfred Legatt, Esq.; George D. Pollock, Esq.
Bankers—Messrs. Cocks, Biddulph & Co.
Solicitors—Messrs. J. L. Bicknell and J. C. Lethbridge.

The leading features of this Society are—

The very moderate Rate of Premium when viewed as combined with *perfect security* to the assured.

The advantage to the Assurers (by Table 2) of becoming entitled to *three-fourths* of the *profits*.

The assurance of a *certain bonus*.

The facility for *securing debts*.

The allowance of *half* the Annual Premium to remain unpaid for *seven years*, and

The accommodation of *temporary loans* to the Assured on available security. Immediate and deferred Annuities are granted by this Society on terms advantageous to the Public.

A liberal Commission allowed to Professional Gentlemen and Agents introducing business to the Office.

EDWARD T. RICHARDSON, Secretary.

NATIONAL LOAN FUND LIFE ASSURANCE, ANNUITY, and DEFERRED ANNUITY SOCIETY, 26, Cornhill, London.—Capital, 500,000*l.*—Empowered by Parliament.

Directors—T. LAMIE MURRAY, Esq. *Chairman.*

John Elliotson, M.D. F.R.S.
John Griffith Frith, Esq.
H. Gordon, Esq.
George Lungley, Esq.
John Rawson, Esq.
Clement Tabor, Esq.
Joseph Thompson, Esq.

Auditors—Prof. Wheatstone, F.R.S.; Prof. Graves, A.M. F.R.S.
Actuary—W. S. B. Woolhouse, Esq. F.R.A.S.

The superior advantages to those Assured with this Society will be best understood by a comparison of its principles and a reference to the last Annual Bonus declared on Policies of five years' standing, viz.:

Entry	Policy No.	Age	Sum	Annual Premium. £ s. d.	Bonus added. £ s. d.	Cash Bonus. £ s. d.	Premium reduced. £ s. d.
1837	39	59	1000	67 8 4	132 14 6	58 19 9	8 19 4
1838	114	56	3000	175 15 0	296 9 7	123 0 6	16 9 7

Policies now entered upon entitled to participation in next Annual Division. Two-thirds of all premiums paid can be borrowed by the assured without loss of Policy.

F. FERGUSON CAMROUX, Secretary.

NORTH BRITISH INSURANCE COMPANY, 4, New Bank-buildings, and 10, Pall Mall East.

His Grace the Duke of Sutherland, *President.*
Sir Peter Laurie, Alderman, *Chairman of the London Board.*
Francis Warden, Esq. (Director H.E.I.C.) *Vice-Chairman.*
John Webster, M.D. 24, Brook-street, *Physician.*

LIFE DEPARTMENT.—This Institution is incorporated by Royal Charter, and is so constituted as to afford the benefits of Life Assurance in their fullest extent to Policy-holders, combined with perfect security in a fully subscribed Capital of One Million, besides an Accumulated Premium Fund of Three Hundred and Fifty-five Thousand, and an Annual Revenue, from Life Premiums alone, of Eighty-two Thousand Pounds.

The last Bonus declared averaged 37 per cent. on the premiums paid. The next appropriation of profits will be made in December, 1844; and persons who now insure will participate therein according to the number of annual premiums paid in the interval.

FIRE DEPARTMENT.—Insurances against Loss by Fire may be effected at the Company's Western Branch Office, 10, Pall Mall East, on Private Houses, Country Mansions, Furniture in the same, and Farm Steadings, at the lowest rates of premium corresponding to the risk.

Prospectuses, containing Tables of Rates, and a full List of the Directors, &c. who are all responsible *Partners*, may be obtained on application to Messrs. B. and M. Boyd, Resident Members of the Board, 4, New Bank-buildings; or to the Actuary, Mr. John King, 10, Pall Mall East.

JOHN KING, Actuary.

PELICAN LIFE ASSURANCE OFFICES, 70, Lombard-street, and 57, Charing-cross.—Established 1797.

Directors.

Matthias Attwood, Esq. M.P.
W. Stanley Clarke, Esq. F.R.S.
John Coope, Esq.
William Cotton, Esq. F.R.S.
Sir William Curtis, Bart.
William Davis, Esq.
J. A. Gordon, Esq. M.D. F.R.S.
Sir W. Heygate, Bart.
Kirkman D. Hodgson, Esq.
R. Henshaw Lawrence, Esq.
J. Petty Muspratt, Esq.
George Shum Storey, Esq.
C. Hampden Turner, Esq.
Matthew Whiting, Esq.

The Plan of this Office will be found to comprise all the Solid Advantages of Life Assurance.

Persons have the option of insuring upon the Return or Non-Return Systems; and the Tables, which include Ascending and Descending Scales of Premium, have been framed to suit the convenience of all parties.

The Rates have recently been reduced agreeably to the most approved calculations; they are also verified by the experience of the Office during Forty Years, and are as low as consistent with safety; those adapted to the RETURN SYSTEM entitle its assured to an equitable participation in the surplus premium, according to the plan detailed in the Company's prospectus.

The Assured under both Systems will possess the guarantee of a large PAID-UP Capital, and the further security of a responsible body of Proprietors, without being exposed to the liabilities of partnership.

Policies are purchased on liberal terms when the object of an assurance is effected;—or, loans will be granted thereon to the extent of five-sixths of such purchase-money.

Prospectuses and every information obtained on application at the Offices as above, or to the Agents of the Company appointed in every City and principal Town in the Kingdom.

R. TUCKER, Secretary.

UNITED KINGDOM LIFE ASSURANCE COMPANY, 8, Waterloo-place, Pall Mall, London.

Charles Graham, Esq.
F. Charles Maitland, Esq.
William Railton, Esq.
John Ritchie, Esq.
F. H. Thomson, Esq.

Secretary—Patrick Macintyre, Esq.

This Company, established by Act of Parliament, affords the most perfect security in an ample paid-up Capital, and in the great success which has attended it since its commencement in 1834. In 1841, the Company declared an addition to the Shareholders of one-half of their Stock, and also added 2*l.* per cent. per annum, from the date of the policies to those parties who had insured with profits. The premiums, nevertheless, are on the most moderate scale, and only a moiety need be paid for the first five years, where the Insurance is for life.

The amount of bonus added to policies since the commencement of the Company in March, 1834, to the 31st Dec. 1840, is as follows:

Sum Assured.	Time Assured.	Sum added to Policy.
£1000	6 Years 10 Months	£136 13 4
1000	4 Years	80 0 0
1000	3 Years	60 0 0
1000	1 Year	20 0 0

Every information will be afforded on application to the Resident Directors, Edward Boyd, Esq. and E. Lennox Boyd, Esq., of No. 8, Waterloo-place, Pall Mall, London.

Frederick Hale Thomson, Esq. *Surgeon*, 48, Berners-street, attends at the Office daily, about half-past 2.

NORTON'S CAMOMILE PILLS are confidently recommended as a simple, but certain remedy, to all who suffer from Indigestion, Sick Headach, Bilious and Liver Complaints; they act as a powerful tonic and gentle aperient, imparting strength to the stomach, and composure to the nervous system. Sold in bottles, at 1*s.* 1½*d.* or 2*s.* 9*d.* each, by A. Willoughby & Co., late B. G. Windus, 61, Bishopsgate Without; and nearly all Medicine Venders.

OLD GILDING, LACKER, and BRONZE, however dirty, faded, or tarnished, rendered equal to new by UPTON'S PARISIAN DETERGENTS. The effect is sudden, astonishing, and lasting; trouble merely sponging the surface, and the expense only a few pence for the largest gilt frame, and the merest trifle for lackered articles. Fly spots are at once removed from gilding; no necessity, therefore, to cover from the fly. Gold detergent, 2*s.* 6*d.* per bottle; lacker and bronze, 1*s.* 6*d.*; lamp, 1*s.* 4*d.* All are innoxious and inoffensive. Sold by Upton & Co., Lamp-manufacturers, 33, George-street, Hanover-square, and 65, Basinghall-street, City. Established nearly 40 years. A trial allowed free of all charge. Trade supplied.

THE OMBROSOME, or PATENT PORTABLE SHOWER BATH, especially adapted for travelling and exportation. By this Bath an inexhaustible shower is produced from a few quarts of water: the height of the shower may be increased or lessened to suit adults or children, and occupying so little room, is peculiarly suited for bed-rooms and dressing-rooms; it is also an excellent Douche Bath. Being little larger than a writing-desk when packed, it will be a great desideratum for exportation to India and other hot climates. To Military Men and others of an migratory life, also to Students of the Universities, Inns of Court, &c. (where rooms are low and water scarce), the present invention cannot fail to be most acceptable. It is made entirely of brass, and is at once simple and elegant.—May be seen at the Royal Polytechnic Institution; and be had, with Prospectuses, at the Bazaar, Panklibanon Iron Works, 58, Baker-street; Mr. J. L. Benham, 19, Wigmore-street; Mr. C. Bray, 16, Cranbourne-street; Mr. J. Deacon, 4, Moorgate-street; Mr. J. Evans, London Bridge, and Ludgate-hill; Messrs. Fallows & Adcock, 4, Halkin-street West; Messrs. Glenton & Chapman, 147, New Bond-street; and may shortly be had of all the leading Ironmongers throughout England.

Price 4*l.* 10*s.* and 5*l.* 5*s.*

WARM WEATHER.—Ease and Comfort for the Feet.—HALL & CO. Wellington-street, Strand, London, sole Patentees of the PANNUS CORIUM, or Leather Cloth Boots and Shoes. These articles have borne the test and received the approbation of all who have worn them. Such as are troubled with corns, bunions, gout, or tenderness of feet from any other cause, will find them the softest and most comfortable ever invented; they never draw the feet or get hard, and for warm climates they are found easier and more durable than any other kind of shoes; they resemble the finest leather, and are cleaned with common blacking. Their Elastic Spring Boots are worthy attention; they supersede lacing and buttoning, and effectually support the ankle. The material sold by the yard in any quantity. Any respectable boot and shoe maker may be appointed agent.—The much-improved PATENT INDIAN-RUBBER GOLOSHES are light, durable, and perfectly waterproof.—HALL & CO.'S PORTABLE WATERPROOF DRESSES claim the attention of all who are exposed to the wet. Ladies' Cardinal Cloaks, with hoods, from 18*s.* Gentlemen's Dresses, comprising Cape, Overalls, and Hood, 21*s.* The whole can be carried with convenience in the pocket.

WATCHES by WEBSTER & SON, Chronometer Makers to the Lords of the Admiralty (Established 132 years), 3, BIRCHIN-LANE. The largest assortment of fine Second-hand Watches of any house in London, by the most eminent makers—many nearly equal to new, and at little above half their original cost, all of which W. & Son warrant. They consist of fine Repeaters, Duplex, Lever, and Horizontal Escapements, all of superior manufacture. New Watches of the most elegant patterns upon the principle of their Chronometers, to which the Government awarded the prizes three years in succession, with compensation balances to counteract the variations of temperature. Also a large assortment of Lever and elegant Horizontal Watches, for Ladies and Gentlemen, at considerably reduced prices. Old Watches taken in exchange. The most experienced workmen are employed on the premises in the repairing department.

Webster & Son, 3, Birchin-lane, Cornhill.

BUTTER MADE IN TEN MINUTES, by the NEWLY-INVENTED CHURN, registered according to Act of Parliament.

ATTWOOD, WIMBLE & WARNER, Manufacturers, LEWES, Sussex.

This CHURN being made entirely of Block Tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which insures the butter coming in ten or twelve minutes. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use.

Sizes,	No. 1,	2,	and 3,
Churn from	7 to 8 lbs.	13 to 15 lbs.	26 to 28 lbs.
Price, carriage paid to London,	25*s.*	35*s.*	42*s.*

Metal Pans for Churns to stand in, 4*s.* 6*d.*, 6*s.*, and 7*s.* Larger sizes made to order. N.B. Thermometers and Butter Prints supplied. May be obtained through any respectable Ironmonger in Town or Country, and from the Manufacturer, Lewes.

To be seen in London, at Wright's Range Warehouse, No. 3, Arthur-street, near the Monument; W. Baily & Son, Furnishing Ironmongers, 71, Gracechurch-street; Livermore & Son, Ironmongers, No. 30, Oxford-street; Benham, 19, Wigmore-street, Cavendish-square. Export Agents, Barnes & Co., 109, Fenchurch-street.

ELECTRO-PLATED and GILT ARTICLES.—ELKINGTON & CO., Patentees, beg to announce that, to meet the increasing demand for this manufacture, they have opened an Establishment at No. 22, REGENT-STREET, (CORNER of JERMYN-STREET,) where every variety of articles for the Side-board, Dinner, Dessert, and Breakfast Tables may be inspected.

They have also a similar assortment at their City Establishment, No. 45, MOORGATE-STREET, where they have a MANUFACTORY for PLATING and GILDING, RE-PLATING and RE-GILDING ARTICLES of every description, and of ALL METALS.

With reference to articles of their manufacture, the Patentees beg to state that they differ from all goods hitherto offered as "Plated Goods" or "Substitutes for Silver," being made in the same manner as SOLID SILVER, from which they cannot be known, and being also composed of a hard white metal, strongly coated with silver by the Electro process.

Silver Articles of every kind or pattern exactly copied.

Every article made by the Patentees bears their stamp (E. & Co. beneath a Crown.)

MOULD CANDLES to BURN WITHOUT SNUFFING.—KEMPTON'S PATENT.—These candles do not require snuffing; they burn longer and are cheaper than any other candle; the flame is steady and brilliant. No metallic or deleterious matter is used in the manufacture. Price 8*d.* per lb. Sold by G. E. Parish, agent for exportation, 21½, Bread-street, City, and by Slodden & Stocking, 42, High-street, Marylebone; W. Gethem, Broadley-terrace, Blandford-square; W. Evans, Italian warehouse, Greenwich; John Hawkins, grocer, High-street, Whitechapel; George Hawley, grocer, Pitfield-street, Hoxton; S. Game, Fish-street-hill; J. Pain, grocer, Bethnal-green-road; G. H. Hudson, 229, Blackfriars-road; C. H. Nicholas, 19, Bolingbroke-row, Walworth; and at the manufactory, Old Bargehouse, Christchurch, Surrey.

DENHAM PARK INSTITUTION

FOR

THE TREATMENT OF MENTAL DISORDERS

AFFECTING THE

UPPER CLASSES OF SOCIETY OF BOTH SEXES.

Director—EDWARD HORNOR, Esq.

Consulting and Visiting Physician—JOHN FORBES, M.D. F.R.S.,

Physician in Ordinary to Her Majesty's Household, and Physician Extraordinary to His Royal Highness Prince Albert,

12, OLD BURLINGTON-STREET, LONDON.

Resident Medical Officer—WILLIAM WILSON, M.D.

Medical Referee in London—ERASMUS WILSON, Esq., 55, Upper Charlotte-street, Fitzroy-square.

SOME changes in the direction of this Institution, and an important addition recently made to its medical staff, seem to justify the Director in calling attention to the claims which it possesses to the confidence of the public and to the support of the medical profession. It is believed that a fuller knowledge of the character of this establishment, on the part of medical men, will be found of importance to them, in many cases, when called upon to recommend a temporary abode for a patient who may be required to be removed from home. It is the object of the Director and Medical Superintendents to give to the Institution the character and appearance of a domestic retreat during the removal of a temporary disease, not of a place for the seclusion and punishment of dangerous and incurable persons. Accordingly, the greatest care is taken, not merely to discard every form of personal restraint, but, as far as practicable, to remove from the observation of the inmates everything that could tend to irritate or distress their feelings; and no pains are spared to cheer the mind, and to lessen the gloom and despondency to which so many of this class of persons are unhappily subject. Opportunities for varied occupation and amusement, within and without doors, are studiously supplied, and exercise in the open air, in the carriage and on foot, is carefully enjoined.

The excellence of the accommodations generally, and the great conveniences and comforts to be found in Denham Park, are, it is believed, of a kind that cannot fail to be approved of. The building is a fine specimen of the old English mansion, having apartments sufficiently spacious for in-door exercises during wet weather, and designed on a scale of magnificence rarely met with in modern houses. The general appearance of the house betrays nothing of its present destination, either in external or internal arrangements; and, besides the usual suites of apartments, it contains a billiard-room, a library, and a consecrated chapel, in the latter of which the patients, officers, and servants of the establishment meet daily for morning and evening prayer.

Classification forms an important part of the arrangements. The Ladies and Gentlemen have each their distinct moiety of the house, and assemble in their separate saloons, from which those are excluded who, from the state of their disorder, would be likely to prove annoying to the convalescents, or be themselves excited by the presence of company. In these reunions the invalids mingle constantly and systematically with the sane; the observances of polite society are carefully maintained; and, by judicious intercourse, the minds of the invalids are strengthened and prepared for that exercise which a return to the world may require. In some instances, where benefit is likely to result to the sufferer, and no inconvenience to the rest of the inmates, relations and friends are admitted to stay with an invalid in the house. This permission has on several occasions been found a desirable privilege, and been eagerly embraced; the arrangements, society, and resources of the establishment being such as to render it an agreeable place of residence to all.

The advantages offered by this Institution for the retirement of Ladies are considered to be especially worthy of notice: they will be found to be highly appreciated by several now resident there.

The Terms of Admission for both Sexes at Denham Park are moderate, and are regulated according to the following among other circumstances: I. The nature and extent of private accommodation required. II. The amount of domestic attendance rendered necessary by the nature of the individual case; or required for the special comfort and convenience of the patient. III. The kind and amount of horse or carriage exercise required as a luxury, beyond what is deemed of importance medicinally, and which is always furnished. IV. The pecuniary means of the Patient; a small number, to whom it is an object, being from time to time received at an inferior charge, provided they are desirable inmates from their position in society and the nature of their malady.

When required, highly responsible persons are sent for patients to any part of the kingdom.

Denham Park is situated on the Oxford Road, two miles from Uxbridge, and within easy reach of the West Drayton and Slough Stations of the Great Western Railway.

Full particulars may be obtained from the Director by letter or personal application, (Denham Park, Uxbridge, Middlesex,) or of any of the Medical Officers.

JUNE 20th, 1843. EDWARD HORNOR.

London: JAMES HOLMES, 4, Took's Court, Chancery Lane. Published every Saturday, at the ATHENÆUM OFFICE, 14, Wellington Street North, Strand, by JOHN FRANCIS, and sold by all Booksellers and Newsvenders.—Agents: for SCOTLAND, Messrs. Bell & Bradfute, Edinburgh; for IRELAND, J. Cumming, Dublin.

THE ATHENÆUM

Journal of English and Foreign Literature, Science, and the Fine Arts.

No. 827. LONDON, SATURDAY, SEPTEMBER 2, 1843. PRICE FOURPENCE (Stamped Edition, 5d.)

For the convenience of Subscribers residing in remote places, the weekly numbers are reissued in Monthly Parts, stitched in a wrapper, and forwarded with the Magazines.—Subscriptions for the Stamped Edition for the Continent, for not less than Three Months, and in advance, are received by M. BAUDRY, 3, Quai Malaquais, Paris, or at the Athenæum Office, London. For France, and other Countries not requiring the postage to be paid in London, 28 fr. or 1l. 2s. the year. To other Countries, the postage in addition. [JAMES HOLMES, TOOK'S COURT, CHANCERY LANE.]

KING'S COLLEGE, LONDON.—The DEPARTMENT of ENGINEERING, MANUFACTURES, ARTS, and ARCHITECTURE, will RE-OPEN on TUESDAY, the 3rd of October next. Further information may be obtained at the Secretary's Office.
August, 1843. J. LONSDALE, Principal.

KING'S COLLEGE, London.—MEDICAL DEPARTMENT.—The several COURSES of LECTURES in this College will COMMENCE for the Winter Session on Monday, the 2nd October.
King's College Hospital.—The Hospital is attended daily at 1 o'clock by the Physicians and Surgeons throughout the year, and Clinical Lectures are given every week during the Winter and Summer Sessions.
Residence of Students.—A limited number of Students may be accommodated with rooms in the College, and some of the Professors receive Students into their houses.
August, 1843. J. LONSDALE, Principal.

PRIVATE PUPIL.—A Clergyman, for some years Tutor to a Nobleman, and subsequently receiving six Pupils into his House, a moderate distance from London, would be glad to fill A VACANCY with a Gentleman's Son, whose Education or Health may require more than common attention. Letters addressed to Rev. J. C. C., Post Office, Hampton Court, Middlesex, will be forwarded to him.

CITY of LONDON SCHOOL, Milk-street, Cheapside, established by Act of Parliament, and under the superintendence of the Corporation of London. Head Master, the Rev. G. F. W. MORTIMER, D.D., of Queen's College, Oxford.—THIS SCHOOL will be RE-OPENED for the next Term (extending to Christmas) on TUESDAY, the 5th of September. The year is divided into three Terms. Fee for each Term, 2l. 15s. The general Course of Instruction includes the English, Latin, Greek, French, and German Languages, Writing, Arithmetic, Book-keeping, Geography, History, and Mathematics. Persons desirous of entering their Sons as Pupils may obtain Prospectuses of the School, containing also particulars of the Foundation, Scholarships, and Exhibitions to the Universities, which are attached to it, together with forms of application for admission, at the Secretary's Office, between the hours of Ten and Four. THOS. BREWER, Secretary.

GENTLEMAN'S LIBRARY.—The Widow of a Gentleman lately deceased, wishes to DISPOSE OF her late husband's Library in one lot. It consists of many of the best Modern Works of Fiction, Travels, General Literature, and Illustrated Works, in all about 500 volumes. Among the latter are Lodge's Illustrious Portraits, in 6 vols., Fisher's National Portrait Gallery, in 4 vols., Knight's Gallery of Portraits, in 7 vols., Finden's Illustrations, Batty's Scenery, &c. The books are all in good condition and well bound, mostly in half morocco. To any Gentleman wishing to possess a small and well-selected Library such an opportunity seldom occurs.—Address Mr. Leighton, Bookbinder, 55, Exmouth-street, Clerkenwell.

DRAWING FROM MODELS.—SOUTHWARK LITERARY INSTITUTION.—A DRAWING CLASS, conducted by Mr. GANDEE, Professor of Perspective, &c., on the successful method of drawing from real Objects, will be Opened at Eight o'clock on Friday Evening next, Sept. 8, at the above Institution. Terms, 40s. for the Course of 40 Lessons of two hours each, to be given every Friday Evening from 8 to 10. Five shillings to be paid in advance.—Further particulars at the Institution, Borough-road, Southwark; or at Mr. Gandee's Drawing Academy, 36, Bedford-street, Strand.

FREE EXHIBITION.—The Public are invited to inspect the PICTURES and other WORKS of ART selected by the Prizeholders in the ART-UNION of LONDON, and now exhibiting to the Subscribers at the British Artists Gallery, Suffolk-street, Pall Mall East, on the 4th, 5th, 6th, 7th, 8th, and 9th instant, between the hours of Eight and Six. The Gallery will be open to the Members and their Friends on the EVENINGS of Tuesday, Wednesday, Thursday, and Friday, from Seven o'clock till Ten, when Visitors will be admitted with the Tickets already issued. The Lists are now open, and an early subscription is solicited.
GEORGE GODWIN, F.R.S. F.S.A. } Honorary
LEWIS POCOCK, F.S.A. } Secretaries.
2nd September, 1843.

GEOLOGICAL MINERALOGY.—PRIVATE INSTRUCTION is given in Mineralogy, with a view to facilitate the Study of GEOLOGY, and of the Application of Mineral Substances in the ARTS, by J. TENNANT, Mineralogist to Her Majesty, 149, Strand, London. J. T. arranges Elementary Collections, which will greatly assist those who are anxious to study Mineralogy, Conchology, or Geology, at 2, 5, 10, 20, to 50 guineas each; he has also an extensive Assortment of Shells, Minerals, and Geological Specimens, for the Cabinet.

CONCHOLOGIA ICONICA. A complete Pictorial and Descriptive Repertory of SHELLS; to which will be added a series of Representations of their Animal Inhabitants. By LOVELL REEVE, F.Z.S. A.L.S. &c. Now publishing under the distinguished patronage of H.R.H. Prince Albert, His Majesty the King of the French, His Majesty the King of Denmark, The Marquis of Northampton, The Grand Duke of Tuscany, and most of the Natural History Societies of England and the Continent; in Monthly Numbers, with text, and figures of the natural size, price 10s. each Number, coloured. No. 8 on the 1st September.

THE LINNÆAN LITHOGRAPHIC PRESS.—The art of chemical printing, either lithographic or zincographic, having greatly superseded the use of copperplate printing for Natural History Illustration, on account of its economy and peculiar softness for colouring, it has become necessary that this important department of the art should be practised exclusively by one who would conduct it with the zeal and discrimination of a naturalist. The Author of the 'Conchologia Iconica' begs respectfully to announce that he has now in operation the most complete lithographic apparatus ever imported into this country, and having used it with great economy and success for the printing of his own drawings, is now ready to execute the most simple or elaborate subjects on Botany, Zoology, Geology, or any of the Natural Sciences, at a cheaper rate than has been hitherto attained. Engravings transferred from copper to stone. Estimates given either for the entire illustration of a subject, including use of stones or zinc plates, drawing, printing, colouring, &c.; or for the printing only.
Lovell Reeve, Naturalist and Scientific Lithographer, 8, King William-street, Strand.

HOWE, LEONARD & CO., AUCTIONEERS AND COMMISSION MERCHANTS, BOSTON, UNITED STATES.—Particular attention given to Sales of New and Old Books, Paintings, Engravings, and Fancy Goods; also any other description of Merchandize. Refer to John Miller, Bookseller, London; Goddard & Hill, Birmingham.

AFTER a long and needless delay, Mr. HATCHER finds that his HISTORY of SALISBURY is published, under the name of ROBERT BENSON, Esq. M.A., and his own, as if Mr. BENSON were the principal and joint author. This Mr. HATCHER distinctly and positively denies. He also disavows the Preface, with which his name is connected, without his consent or knowledge. The real Preface will shortly appear, with a statement of the circumstances attending this extraordinary transaction.
Salisbury, August 30, 1843.

TO BOOKSELLERS, PRINTERS, &c.—TO BE DISPOSED OF, the GOOD WILL and STOCK in TRADE, &c. of a Bookseller, Printer, Stationer, &c. at East Retford, in the County of Nottingham. The Business has been established upwards of 50 years, and the connexion is extensive and of the highest respectability. The Premises are very complete, and in the most favourable situation in the Town. For further particulars, and to treat for the purchase, apply to Messrs. White & Son, Auctioneers, East Retford.
Retford, August 24, 1843.

RECONNOITERING TELESCOPES.—These beautiful Instruments, measuring but 3¼ inches when closed, possess sufficient power to show clearly Jupiter's moons, price 35s., securely packed and sent through the post for 1s. To be had only of the maker, JOHN DAVIS, Optician, Derby; or at the establishment of his brother, High-street, Shrewsbury.

OFFICE for PATENTS of INVENTIONS and REGISTRATION of DESIGNS, No. 14, Lincoln's Inn-fields, where all business relating to the Securing and Disposing of BRITISH and FOREIGN PATENTS, Preparation of Specifications, Drawings of Inventions, is expeditiously and economically effected.
Also REGISTRATIONS under the New Consolidated Copyright of Designs Act, 5 & 6 Vict. cap. 100.
A Prospectus, containing much useful information, may be obtained, and references to an Alphabetical List of Patents and Registrations made, on application to Mr. Alexander Prince, 14, Lincoln's Inn-fields.

CHOICE AND VALUABLE SECOND-HAND BOOKS.
Just published, Gratis, and forwarded, on application, to any distance at the cost of a double postage, Part the Fourth of

DOWDING'S CATALOGUE for 1843; comprising an extensive and very superior Collection of the BEST STANDARD WORKS in DIVINITY, HISTORY, and PHILOSOPHY; the ARTS and SCIENCES; VOYAGES, TRAVELS, and BIOGRAPHY; POETRY and the DRAMA; and the other branches of lighter ENGLISH LITERATURE; with extraordinary low prices for ready money affixed, on Sale at No. 87, Newgate-street.
Parts 1, 2, and 3 can be had; each at a double postage.
J. D. invites particular attention to the exclusive cheapness of the various copies of the ENCYCLOPÆDIAS, ANNUAL REGISTER, PARLIAMENTARY HISTORY and DEBATES in the Catalogue.

.. EVENING—FULL DRESS BALL.
The MORNING PERFORMANCES will be in the TOWN HALL; the EVENING in the THEATRE.
Tickets of admission to the reserved seats, for the Morning Performances, 21s. each; ditto, for the Evening Performances, 15s.
The GREAT ORGAN of the TOWN HALL has received great additions, and other improvements, since the last Festival; and is now considered the most powerful and perfect Instrument in Europe.

APARTMENTS.
Persons desirous of engaging Apartments during the approaching Festival, are requested to make application to Mr. LYON'S, Bookseller, 20, Bennett's-hill, Birmingham, where a Register of Lodgings may be inspected.
Visitors applying will find ample accommodation on reasonable terms, a Committee having been appointed for the superintendence of this department.
GEORGE BARKER,
Chairman of the Committee of Management.
August 15, 1843.

BRITISH METALLURGICAL ASSOCIATION of ALICANTE.—According to a statement lately printed by the Directors of the above Association at Alicante, it appears that the result of their operations to 30th April, 1843, was—

	Dollars.	
373,739 oz. Silver delivered at their works agreeably to contracts entered into, the proceeds	418,037	14 6
16,084 cwt. of Leads, of which 8,084 had been shipped to England, the proceeds, including a profit insured on cargo, per *Ocean Child*, which vessel foundered at sea	61,618	0 26
8,000 cwt. remained for sale or further shipment. The cost of the Buildings at Alicante	33,430	9 0
The cost of Machinery from England, and erecting seven furnaces	28,696	16 15
The cost of a Smelting Establishment at Garrucha, with five furnaces complete, which now yields from 40,000 to 45,000 ounces of silver monthly, besides lead, at a comparatively small expense, owing to its proximity to the mining district	45,000	0 0
	107,127	5 15
Profits on an average of nine months' work, with actual force at both works, on a capital of only 50,000 dlrs.	54,904	7 16
Deduct extraordinary expenses, which will not occur again, incurred in bringing from England an experienced assayer, and the necessary workmen of every description, including their salaries until the works were ready D. 10,000 0 0 and interest on monies taken on loan 14,904 19 30	24,904	19 30
	D. 30,699	7 30

Net gain on 30th April, 1843, including every charge from commencement of the enterprise 16 months ago, for a dividend of 61 per cent.
At a General Meeting of Shareholders held on the 31st of May last, in conformity with the rules of the Company, it was resolved that 250 additional shares (or more, if the Directors judged fit) should be issued at 400 dlrs. each: of these a number were at once subscribed for, and by last advices about one-fifth of the new issue had been disposed of. It was originally contemplated by the leading shareholders that the capital of the Company should be composed of 2,000 shares, at 100 dlrs. each; however, it was finally agreed on between them that a trial should be made with only 500; this has been done, and with such very flattering results, that the recommendation of the Directors in favour of a further issue of shares for the purpose of forming a more suitable capital, was unanimously approved of.
N.B. By the 13th article of the Deed of Settlement, and in accordance with the articles of the Spanish Commercial Code, Shareholders are only answerable for the liabilities of this Company to the extent of their respective shares.
Applications for shares (400 dlrs. each—85l. sterling) to be made at the office of the Company's London Agents, 28, Bucklersbury, between the hours of 11 and 2. CLAY & GILLMAN,
28, Bucklersbury, Aug. 25, 1843. Agents.

TO ARCHITECTS, SURVEYORS, BUILDERS, AND OTHERS.

PATENT METALLIC CEMENT.—The Proprietors of this valuable Cement (which is prepared from a metallic sand, similar in quality and chemical analysis to the best Italian Pozzelana), after ten years' experience of its excellent qualities, can now, with the fullest confidence, recommend it to the attention of architects, builders, and the public generally, as being superior to and cheaper than any other Cement at present in use.
In colour and texture this Cement closely resembles the best Portland stone; it is much improved, both in appearance and durability, by exposure to the weather, requires neither colour nor paint, and remains entirely free from the green tint produced by vegetation.
The Metallic Cement, when used as an external Stucco for houses, and other buildings, is not liable to be affected by the action of frost, is impervious to all kinds of fresh or salt water, and has (in addition to the numerous trials made of it in this country) stood, without having received the slightest injury, the severity of the climate of New York. It is entirely free from those cracks and blisters which disfigure Roman Cement, and its adhesive qualities are so perfect as to render it almost impossible to separate it from the bricks, slate, or other material upon which it has been laid.
When used as an internal stucco for walls, staircases, passages, &c., it will be found to possess great advantages, and can, if required, be trowelled up to a face equal to that of marble.
The extreme beauty and durability of the architectural enrichments which have been executed in this material, warrant the proprietors in claiming for it a marked and decided superiority over all other cements; and they can with the utmost confidence refer to very extensive and highly enriched buildings in which the whole of the decorations (formed of Metallic Cement) have stood for a number of years, uninjured by frost or rain, and still exhibit all the sharpness of outline possessed by the best stone carvings.
Employed as a concrete for foundations, or as a mortar for brickwork, in the erection of bridges, viaducts, tunnels, &c., the Metallic is preferable to all other mortar cements, from its extraordinary adhesive qualities, the extreme hardness which it ultimately attains, and the facility with which it can be applied, in corroboration of this statement the proprietors refer to the tunnels at Primrose-hill and Kensall-green, on the London and Birmingham line of railroad, and to the foundations of the new Houses of Parliament, which have been formed entirely of Metallic Concrete.
The Metallic Sand is found of peculiar advantage when mixed with Roman Cement, as it entirely prevents vegetation, and the general decay which in so short a time is exhibited in that material.
References and further particulars may be obtained, and specimens seen, on application at the Metallic Cement and Blue Lias Lime Wharf, King's-road, Camden New Town (opposite Pratt-street); or of Mr. Charles K. Dyer, 4, New Broad-street, London.

Now ready, price 1s.

GUIDE to FEMALE HAPPINESS through the PATHS of VIRTUE.
By ELIZABETH JANE CASTELL.
"Virtue alone is happiness below."—*Pope.*
London: C. Mitchell, Red Lion-court, Fleet-street, who will send the above to any address, free, on receipt of a pre-paid letter containing 1s., or postage stamps of equal value.

THE NEIGHBOURS: a Story of Every-day Life. Second Edition, 3 vols. post 8vo. 18*s*. boards.

THE HOME; or, Family Cares and Family Joys. 2 vols. post 8vo. 21*s*. boards.
"It is impossible to read this book as a piece of *make-believe*. We have had nothing so simply life-like since Galt's 'Annals of the Parish'—no pictures of female nature so finely touched, since Miss Austen's. As an illustration of northern life and manners, too, the tale has great value."—*Athenæum*.

2.
Professor Owen's Hunterian Lectures.

LECTURES ON THE COMPARATIVE
ANATOMY AND PHYSIOLOGY OF THE INVERTEBRATE ANIMALS,
Delivered at the Royal College of Surgeons in 1843.
By RICHARD OWEN, F.R.S., Hunterian Professor to the College. From Notes taken by WILLIAM WHITE COOPER, M.R.C.S.; and revised by PROF. OWEN. With Glossary and Index. 8vo. with nearly 140 Illustrations on Wood, 14*s*. cloth.

3.
The Marquis De Custine's Work on Russia.

THE EMPIRE OF THE CZAR;
Or, Observations on the Social, Political, and Religious State and Prospects of Russia, made during a Journey through that Empire. By the MARQUIS DE CUSTINE. Translated from the French. 3 vols. post 8vo. 31*s*. 6*d*. cloth.
"M. De Custine has exhibited some new views on Russia in a striking and attractive way. To the Frenchman's sparkling vivacity of manner he adds his skill in seizing upon the incidents of action, the features of character, or the points of things, and presenting them with an attractive or inspiring effect."—*Spectator*.

4.
Lady Blessington's New Novel.

MEREDITH.
By the COUNTESS of BLESSINGTON.
3 vols. post 8vo. 31*s*. 6*d*. boards.
"'Meredith' is, in every respect, one of Lady Blessington's best—we should perhaps not be going too far to call it her best work."—*Morning Post*.

5.
Bedford Correspondence.

CORRESPONDENCE OF JOHN, FOURTH DUKE OF BEDFORD.
Selected from the Originals at Woburn Abbey. With an Introduction by LORD JOHN RUSSELL. 8vo. Vol. I. (1742—48) 18*s*. cloth; Vol. II. (1749—60), 15*s*. cloth.
"The second volume of this publication includes a correspondence having relation to the period from the Peace of Aix-la-Chapelle to the death of George II. Its most remarkable portion bears upon an important question on which there exist some differences of opinion at the present time,—namely, the intrigues which led to the junction of the Duke of Newcastle and Pitt in 1757. The letters respecting the state of Ireland under the Viceroyalty of the Duke of Bedford, also here, are not a little interesting."—*Morning Herald*, Aug. 30, 1843.

6.
Capt. Postans' New Work on Sindh.

PERSONAL OBSERVATIONS ON SINDH;
The Manners and Customs of its Inhabitants; and its Productive Capabilities: with a Narrative of the Recent Events. By CAPT. POSTANS, Bombay Army; late Assistant to the Political Agent, Sindh. 8vo. with new Map, coloured Frontispiece, and other Illustrations, 18*s*. cloth.
"We thank Capt. Postans for the information furnished in his volume, and recommend it to the early perusal of our readers."—*Eclectic Review*, Sept. 1843.

7.
THE BIOGRAPHICAL DICTIONARY
OF THE SOCIETY FOR THE DIFFUSION OF USEFUL KNOWLEDGE.
Vols. I. and II. 8vo. in Four Half-Volumes, 12*s*. each, cloth.
*** Half-Vol. 5 (Vol. 3, Part 1), will be published *next week*.

8.
Barker's Lempriere, revised and expurgated.

LEMPRIERE'S
CLASSICAL DICTIONARY,
Abridged for Public and Private Schools of Both Sexes. By E. H. BARKER, of Trinity College, Cambridge. A New Edition, revised and corrected throughout by JOSEPH CARWIN, Assistant Editor of 'Brande's Dictionary of Science, Literature, and Art.' 8vo. 12*s*. bound. [*Next week*.
*** To enable the editor to make the additions and improvements, without altering the nature of the work as an abridgment, or increasing materially its cost to the purchaser, a quantity of matter not calculated to assist the scholar has been erased, numerous repetitions which encumbered the previous editions have been removed, and the size of the original volume has been increased by upwards of two hundred pages.

London: Longman, Brown, Green, and Longmans.

NOW PUBLISHED,
PRINTED IN VARIOUS STYLES AND SIZES,
FOUR EDITIONS
OF

The Psalter;

OR,

PSALMS OF DAVID IN METRE;

FROM THE AUTHORIZED VERSION OF BRADY AND TATE.

SET TO APPROPRIATE TUNES, ARRANGED FOR FOUR VOICES, WITH AND WITHOUT ACCOMPANIMENTS.

EDITED
BY JOHN HULLAH.

Together with Indices, and Tables showing the Psalms applicable to the Morning and Evening Services of the Sundays, and other Holy-Days, throughout the Year, according to the Form and Order of the Book of Common Prayer.

EDITION I.

The Psalter, with the Tunes in Score, set for Four Voices, with ACCOMPANIMENTS for the Organ or Pianoforte. *Folio Edition.* Price, bound in cloth and lettered, 24*s*.; half-bound morocco, gilt edges, 28*s*.

This Edition is adapted for the Organ Desk, the Drawing-room, or the Study.

EDITION II.

The Psalter, with the Tunes in Score, set for Four Voices. *Super-royal Octavo.* Price, bound in cloth and lettered, 15*s*.; half-bound morocco, gilt edges, 17*s*. 6*d*.

This Edition is in Score, without Accompaniments, for Use in Church, and for practice in Families.

EDITION III.

The Psalter, with the Tunes set in separate Voice Parts, viz., SOPRANO, ALTO, TENOR, and BASS, each in a distinct Volume. Price, bound in embossed roan, gilt edges, 6*s*.; and in morocco, 8*s*. 6*d*. per volume.

These Volumes of separate Voice Parts are ornamentally printed in foolscap octavo, uniform in size with some of the most approved Editions of the Common Prayer, Church Services, &c.

EDITION IV.

The Psalter, with the Tunes set for separate Voice Parts, each in a volume, as above. Price, bound in coloured sheep, 2*s*.; in embossed roan, gilt edges, 2*s*. 6*d*. per volume.

In the same size as the Nonpareil Twenty-fours Editions of the Prayer Book, and adapted by its cheapness to general use and gratuitous distribution.

☞ *In ordering the Psalter, whether in Score, or in Separate Voice Parts, it will be found convenient to describe the Edition as well as the binding required, in the words used in this List.*

In these Editions of the *Psalter*, each, or one or more portions of each, of the Psalms is set to an appropriate Tune; and every word of each verse is placed under the note to which it is to be sung. The Work, therefore, forms a complete Psalm Book for those who do not, as well as for those who do, join in congregational singing.

Each volume contains Three Hundred and Fifty Pages of Music, besides the Indices and Tables; and every Volume, whether of the Score, or of the Separate Voice Parts, being printed page for page, the most perfect uniformity extends throughout the whole Series.

REVIEWS

On Feigned and Factitious Diseases, &c. By H. Gavin, M.D. Churchill.

THIS volume opens a curious and interesting chapter in the history of human nature—a chapter studied but by a few, and scarcely even apprehended by the mass of observers. That man should (in the language of Falstaff) "turn diseases to commodity," is certainly no anomaly in his general habits; and there are cases in which the recurrence to sham pleas of sickness, for specific purposes, is an admitted fact. But the extent to which the practice is carried, the almost infinite variety of diseases simulated, the exhaustless ingenuity exerted, both in the commission of fraud, and in attempts to detect and defeat it, are but obscurely guessed at in the philosophy of any, save those who are specially interested in the consideration. From the truant schoolboy to the veteran intriguing for a retirement and a pension, manifold are the practices upon the ignorance or the credulity of the profession; and as if such sinister motives were not enough to urge on the cheat, occasions are of frequent occurrence, in which a species of monomania impels its victims to the practice of this deception, or in which a simply perverse cunning finds its account in successful imposition, unmotived by any ulterior purpose.

It is, however, in the army and navy that the principal inducements are offered to practice deception; it is there, especially, that a war of ingenuity is engaged between the simulator and the medical officer; and the arts of deception have been carried to such perfection, that Foderé thought it as difficult to detect a feigned, as to cure a real, disease. The counterpart of such deceptions, the dissimulating real diseases, either for the purpose of receiving enlisting money, or, in civil life, for defrauding insurance offices, is less dwelt upon by the author; but the amount of fraud thus attempted or committed is by no means small.

For the purposes of deception, the symptoms of disease may be altogether feigned, or a real disease may be factitiously excited; or, again, a natural infirmity may be exaggerated, either by false representations, or by the employment of drugs. There is also another case in which fraud is largely mixed with reality—we allude to that of enthusiasts of various denominations, who begin by yielding to the influence of the imagination, or who fall into morbid conditions by the activity of the imitative instinct, and who, when well warmed to the business, supply by combination and contrivance whatever may be wanting, in these causes, to complete the colouring of the tale. This mixture of the true and the false is, indeed, sometimes dependent upon a still more extraordinary principle of our nature; for it is found, that hysterical women and hypochondriacs, who really believe themselves the victims of the most extraordinary and impossible diseases, when baffled in their statements of imputed fact by the intelligence of their medical adviser, are prone to attempt making good their story by artful imposition. This affords an additional difficulty in the discharge of professional duties; for the discovery of a determinate fraud does not exhaust the inquiry, by yielding a certainty that there is nothing real in the case. So also the means adopted for exciting fictitious disease may end in establishing a real malady, or the bare mimicry of certain symptoms may lead to their establishment as a positive disease. Thus the efforts made to excite a temporary irregularity in the action of the heart, may occasion positive disorganization of that part; and the frequent enactment of a fictitious fit of epilepsy, is a not unfrequent means of establishing the actual disease. This complexity of the subject besets the practice of the medical officer with many snares; for not only is he called on to guard against imposition, but to defend his patient from false imputations, and most especially to protect the sick against his own passions, irritated by the suspicion of imposition. The encounter of wits, thus established, between the impostor and the officer to whose care he is committed, is of the most exciting description; and the *amour propre* of both are deeply compromised by the issue. Obstinacy on one part begets a corresponding obstinacy on the other; and it is often a mere question of who shall hold out longest. It must be borne in mind, also, that as certainty must bring the contest to an abrupt conclusion, the bare fact of its being carried on entitles the patient to all the benefit to be derived from doubt. It will not do to presuppose guilt, and to attempt a clearing up of the mystery by means, which would be tyrannous to the innocent, though no more than just punishment to the offender. On this point Dr. Gavin makes a grave and important distinction—that punishment is no part of medical duty: that when certainty of guilt is once obtained, the facts belong to the cognizance of a court-martial. It follows, therefore, most cogently, that the surgeon is not justified in the application of cruel tests, amounting to punishment, in the apprehension that they may tend to conviction. Again, as we have stated, fraud itself does not necessarily imply guilt:—

"Perversion of reason, rather than the attainment of a discharge, or the evasion of duty, would sometimes appear to give rise to the simulation of diseases. In corroboration of this statement, Dr. Cheyne says, that he has no doubt that soldiers are often actuated by the same wayward fancies, so perplexing to the physician, which influence hypochondriacal or hysterical patients in the middling or upper ranks of life. Dr. Hennen states, that some of the diseases of soldiers derive their character from a certain state of mental hallucination. Some soldiers, indeed, without any ulterior object, seem to experience an unaccountable gratification in deceiving their officers, comrades, and surgeon: and Marshall remarks, that the simulation of disease, in some instances, seems rather to be a consequence of insanity, than a rational attempt of a man to improve his future prospects. He instances a man who divided the tendo-Achillis with a razor, and prevented as much as he possibly could its reunion, who bore an excellent character, had served twenty-six years, and might have been discharged with a good pension when he pleased. It is stated in the 'Cyclopædia of Practical Medicine,' that there are cases which indubitably show, that the simulation of disease has frequently been practised without the existence of any interested motive, indeed without motive of any kind; that there is, in short, a species of moral insanity of which this simulation is the characteristic."

The surgeon, therefore, is at most justified in such attempts only at extorting confessions of fraud, as consist in the employment of those severe remedies which are adapted to the cure of the disease, if it should be real; and in the application even of such tests, there is this additional evil, that it may be difficult to determine how far the resulting convalescence is the effect of a dislike to the remedy, or depends on a really curative operation. These considerations are sufficient to exhibit the perplexing nature of the inquiry, and to show the narrow path to be trod between carelessness or a false humanity on the one side, and on the other, a culpable desire to detect fraud at all risks—an overweening conceit, and a wish to be thought adroit and clever at the expense of others.

The motive for simulation being given, it is clear that every disease may be assumed; but there are certain bounds, affixed by circumstances, to the field of imposture, which materially narrow the inquiry. Thus, if the object be to obtain a prompt relief from an impending duty or punishment, the disease assumed must necessarily be an acute malady; if the end be a discharge from the service, a chronic disease is most easily assumed for the requisite time, and is less easily detected, than one of which the features change from hour to hour. Again, the probable ground for deception will be a malady with which the patient is best acquainted. The military student of the art finds his readiest lessons in the infirmary; and as he cannot affect with success a disease, when he is ignorant of all its symptoms and accidents, he will most likely choose some one that he has witnessed in that hospital. Then, again, the skulker will prefer such diseases as exhibit the fewest symptoms cognizable by the senses, and for the knowledge of which the examiner is most exclusively dependent on the veracity of the narrator. On this account deaf-dumbness is a favourite cheat with mendicants, and with those whose previous history cannot easily be traced. Dr. Gavin, among other instances, quotes an impostor,—

"Whose remarkable ingenuity resisted for four years an infinity of investigations by the most scientific men in France, Germany, Switzerland, Spain, and Italy, but whom the Abbé Sicard afterwards detected by his writing as he heard, not as he saw. This case, however, would not have been detected, had he not foolishly stated himself to be an élève of the Abbé Sicard. He was put to the most trying proofs, he was tempted by a young and beautiful woman, who offered him her hand, but without effect. In the prison at Rochelle, the turnkey was ordered to sleep with him, to watch, and never to quit him. He was repeatedly violently awakened, but his fright was expressed by a plaintive noise, and in his dreams guttural sounds alone were heard. The hundred prisoners who were all ordered to detect him if possible, could discover nothing from which they could imagine deceit. The following extracts will serve as a specimen of his writing, and afford an illustration of the ingenious manner in which he was detected:—'*Je jur de vandieux; ma mer et né en nautriche; quhonduit* (pour *conduit*); *essepoise* (pour *espoir*); *torre* (pour *tort*); *ru S. Honoret; jai tas present* (pour *j'étais présent*); *jean porte en core les marque* (pour *j'en porte encore les marques*).' It will be observed that in this letter Victor uses *q* instead of *c*; and from this Sicard inferred, that he had heard and knew that the sound of these gutturals was similar."

The performance of the deaf and dumb part is, however, more difficult than is usually supposed, requiring an incessant vigilance to preserve the necessary self-control:—

"The impostor frequently forgets himself during sleep, when any one calls him by name. He endeavours to escape from danger when there is a great noise. The dumb man, when he is attacked at night, as if by a murderer, forgets his part in defending himself, and cries out; whereas he ought merely to give a kind of screech. Extreme pain often entices from him articulate tones,—though Cheyne mentions the case of a man pretending this complaint, who was shot in the ear by an awkward recruit, yet did not forget himself, and only expressed pain and consternation by a variety of motions and contortions. This man exhibited this disability for no less a period than five years, and only recovered his speech when he was discharged from the service. Very frequently the deaf hear, and the dumb speak, when an operation threatens them. This, however, was not the case with a seaman on board the *Utile* frigate, who pretended to be deaf and dumb. The surgeon, appearing to be deceived by him, made very formal and ostentatious preparations for an operation upon his throat, and while his attention was thereby engaged, he applied a lighted candle to the man's fingers. He resisted this test, however, and represented his case to the Admiralty, who caused the surgeon to be dismissed his ship for cruel, or at least unprofessional treatment of his patient. The person, afterwards finding that the deceit was productive of no advantage,

Digitized by Google

gave in. This man was of a very different temper from the simpleton of whom Parr speaks,—'How long have you been dumb, my good friend?' says a passenger, with the most insidious humanity. 'Three weeks, sir!' replied the incautious deceiver. Foderé says, that a good way to detect pretended deaf-dumbness, is to say something deeply interesting to the patient in his presence, and mark the effect it produces on his countenance. Sir Walter Scott illustrates this admirably in 'Peveril of the Peak,' where Fenella betrays herself on hearing that Julian is assassinated."

Among the many diseases which may be feigned for fraudulent purposes, madness has recently been brought into peculiar notice, through an epidemic apprehension, that the facility of deception will tempt to the perpetrating great crimes against society. On this point Dr. Gavin affords some curious information. A false plea of madness as a means of extorting charity, by working on the fear, as well as the charity, of individuals, is as old as the history of mendicity; but the rareness with which it has been pleaded to avoid punishment, shows that it is not a very effectual means of escape. Indeed, it is hardly to be believed, that any one urged by passion to commit a great crime, would take time to establish the requisite fictitious antecedents for laying a ground-work for the plea. Dr. Gavin justly thinks, that the disease itself is difficult to feign, so as to deceive the expert. It is curious, he says,—

"To observe, that among the numerous delineations of insanity, presented in the writings of poets and novelists, there is scarcely one in which there could not be pointed out the most glaring deviations from nature, so much so as to strike any one competently informed and versed in the history of the disease. Shakspeare, Goethe, and perhaps a few others, might stand the application of the severest test; but nearly all others have completely failed in their delineations. * * Dr. Cheyne says it is extremely difficult to feign insanity, so as to deceive those who are familiar with the phenomena of mental disease. Yet he states that we are in more danger of supposing insanity simulated when it is real, than of supposing that disease to be real which is only pretended."

On the whole, the difficulties which at present surround this question, in practice, seem to arise "less from the obscurity of the subject, than from the imperfect means which have been applied to its elucidation."

But if furious lunacy be difficult to feign, monomania is still more so, as almost every writer on the subject asserts. It is a form little known to the general public; and nothing but a long and minute observation of the quiet, half-rational insanity of the monomaniac can qualify an impostor for his task:—

"The simulator is deficient in the presiding principle, the ruling delusion, the unfounded aversions, and causeless attachments, which characterize insanity. He is unable to mimic the solemn dignity of characteristic madness, nor recurs to those associations which mark this disease; and he wants the peculiarity of look which so strongly impresses an experienced observer. His feelings are not so concentrated as to be almost inaccessible to impressions unconnected with the subject of his melancholy. No moral abyss separates him from all objects and sentiments that present no relation to his fears or delusions. No periodicity or exacerbation characterizes his disease. It is most difficult for him to sustain his part, and to cause no false vibration of the cord upon which his exclusive idea is accounted to depend. The mental and physical peculiarities of partial mania are of a kind that do not obtrude themselves on the observation; and instead of loudly proclaiming his crazed condition, and soliciting the attention of the beholder, some investigation is required in order to discover them. This, however, is contrary to the purposes of the simulator; which require an immediate and powerful impression to be produced on the minds of his supervisors. The real monomaniac never troubles himself to make the subject of his delusion accord with other notions having relation to it, and the spectator wonders that he fails to observe the inconsistency of his ideas, and, that when pointed out to him, he should seem indifferent to, or unaware of this fact. In the simulator the physician will discover an unceasing endeavour to soften down the palpable absurdity of his delusions, or reconcile them with correct and rational notions. This marked anxiety to produce an impression, is widely different from the reserve and indifference of the real disorder, and will of itself furnish almost conclusive proof of simulation. Marc states, that a real monomaniac is strongly prejudiced in favour of his opinions; that the slightest contradiction excites his temper; while the simulator readily overlooks this essential point in his part, if the contradiction be skilfully managed."

Of moral insanity (which, in our estimate is improperly separated from monomania with illusions, as differing only in degree,) we have a graphic detail, for which we must make room, as the subject is as yet so imperfectly before the public:—

"The term Moral Insanity has been adopted, because physicians have not been able to detect any delusion or hallucination in the persons affected. The intellectual faculties appear to have sustained but little injury, whilst the feelings and affections are perverted and depraved, and the power of self-government is lost or greatly impaired. * * In some instances, the *impulses* and propensities to which the patient is subject, or which he has indulged, are so exalted or disordered as to constitute the sole manifestations of insanity, as ably insisted upon by Reil, Hoffbauer, &c. Dr. Pagan states, that 'disease of the moral faculties may exist, when it is impossible to discover any intellectual disorder.' * * Marc relates facts, which, he observes, display a struggle in the mind of the individual between the instinctive desire which constitutes the whole manifestation of disease, and the judgment of the understanding still unaffected and struggling against it. Prichard remarks, that 'individuals labouring under this disorder, are capable of reasoning or supporting an argument on any subject within their sphere of knowledge, and often display great ingenuity in giving reasons for their eccentric conduct, and in accounting for and justifying the state of moral feeling under which they appear to exist.' 'There are madmen,' Esquirol observes, 'in whom it is difficult to discover any traces of hallucination: but there are none in whom the passions and moral affections are not disordered, perverted, or destroyed. I have in this particular met with no exception.' * * It is under this division of insanity that the commission of acts of violence frequently occurs. In many it displays itself in an irresistible propensity to commit murder (homicidal moral mania, and suicide), in others to commit theft: in some the principal or sole manifestation, is a propensity to break or destroy whatever comes within reach of the individual. Many lunatics of this class have felt themselves impelled to set fire to buildings, often of the most venerable description."

Referring to the indisposition of English lawyers to admit the existence of moral insanity, Dr. Gavin arrays the following witnesses in behalf of its reality:—

"Facts well authenticated, and the opinions of practical men, established upon the ground of experience, authorize a very different conclusion. Abroad, Otto, Esquirol, Gall, Spurzheim, Broussais, Orfila, Andral, Marc, Georget, Michu, Guislain, Ray, Rush, Reil, Platner, Ethmuller, Henke, and many others, have avowed their belief in the various forms of homicidal insanity: while in this country, Drs. Prichard, Elliotson, Burrow, Mayo, Pagan, Combe, Conolly, Dr. Wake, of York, Drs. Bompas Fox, and Symonds of Bristol, Mr. Hitch of Gloucester, and many others, are among the supporters of the doctrine. The German writers, Hoffbauer, Reil, and Heinroth, admit, more or less distinctly, the existence of moral insanity, or of a mental disease consisting exclusively in undue and morbid excitement of the passions and feelings. But neither they nor Pinel have assigned to moral insanity so general a description as the truth warrants, nor have they referred to it all the different forms which really belong to it."

That these witnesses are trustworthy few will be disposed to deny; and yet, if their testimony contain the truth, the inferences to be drawn from their statements are obvious; and they are of the most melancholy character:—

"Dr. Georget believes that madmen have died upon the scaffold, and that others have undergone every mark of infamy. Marc likewise observes, that homicidal monomania has brought to the scaffold many deplorable victims, who merited compassion rather than punishment. Prichard also states, that it is not to be doubted that men have been occasionally executed as criminals, who, if they had been kept in confinement, would have proved to be insane. Ray states, that of the double homicides to which this affection has given rise, there can be no question which is most to be deplored; for shocking as it is for one bearing the image of his Maker to take the life of a fellow-being with brutal ferocity, how shall we characterize the deliberate perpetration of the same deed under the sanction of law, and with popular approbation? It has been well remarked, that until the existence of moral insanity is distinctly recognized, there will always be a danger of this event ensuing on the trial of mischievous lunatics."

The homicidal monomania presents itself in two forms, as it exists with and without hallucinations:—

"In the first form the murderer is hurried on by a strong but delirious conviction, by the exaltation of a wandering imagination, by false reasoning, or by maniacal passions; is always excited by an acknowledged and unreasonable motive; the understanding is disordered under the influence of a false perception, or of a delusion momentarily entertained, and the insane person acts under an error of judgment, and always offers sufficient signs of partial aberration of intelligence or of the passions. This class is undoubtedly *monomania*—partial intellectual mania. In the second form, the homicidal moral maniac shows no appreciable alteration in his intelligence or passions [save only the insane passion for blood]. Reasoning and judgment are suspended; he is led on by a blind instinct—by an idea—by some undefinable feeling—which prompts him to kill. This insane impulse impels and directs the will without any effort of the understanding or of the moral powers to prevent the act. Even when his conscience recoils with horror from the act which he is about to commit, the unbalanced will is overcome by the force of that feeling which hurries him on. The murderer, uninfluenced by delirium, or emotion, or passion, and almost without consciousness, is led on by an irresistible power; by a force which he cannot overcome; by a blind and instantaneous impulse; by an undeliberated determination independent of the will, and before which reason and judgment are for a moment entirely prostrate; one cannot divine that which prompts him—without interest, without motive, without intellectual aberration,—to an act so atrocious, and so contrary to the laws of nature."

Of the connexion between homicidal mania and suicide, Dr. Gavin presents very nearly the same language as that we have quoted from Mr. Sampson [*Athen.* No. 803]: we need not therefore repeat it.

On the discriminating tests between disease and criminality in these cases, Dr. Gavin observes:—

"Homicidal moral maniacs are lonely, without accomplices who can excite them by their counsels or their example, and are frequently hereditarily predisposed to insanity. Criminals have their companions in immorality and debauchery, and usually their accomplices, and do not exhibit this predisposition. In the history of the homicidal moral maniac, it will be found that the impulse to destroy has been powerfully excited by the sight of murderous weapons, by favourable opportunities of accomplishing the act, by contradiction, disgust, or some other equally trivial, and even imaginary circumstance. The criminal has always a motive; the murder is for him only the means to an end; it is to satisfy a more or less criminal passion, and has an obvious reference to the ill-fated victim, and is nearly always complicated with some other criminal act. * * The criminal never sheds more blood than is necessary for the attainment of his object; the homicidal moral maniac often sacrifices all within his reach to the cravings of his murderous propensity. The criminal lays plans for the execution of his designs; time, place, and

Digitized by Google

weapons are all suited to his purpose. The homicidal moral maniac, on the contrary, for the most part, consults none of the usual conveniences of crime. If, as sometimes happens, he does prepare the means, and calmly and deliberately executes his project, his subsequent conduct remains the same. * * The criminal selects his victims from those who may present obstacles to his designs, or who may inform against him. The acts of the moral maniac are in opposition to the influence of all human motives; he immolates those beings to whom he is indifferent, or who have the misfortune to come in his way at the time when he is seized with the idea of murder; but more frequently he chooses his victims among those who are most loved and cherished by him; and it is remarkable how often they are children, and especially his own offspring. A mother kills her infant and not the child of a stranger; a husband destroys the wife with whom he has lived in harmony for twenty years; a daughter wishes to murder the mother whom she adores. * * The subsequent conduct of the unfortunate moral maniac is generally characteristic of his state. When he has accomplished his momentary design, he has no more upon his thoughts: he has killed, he has finished everything, his end is attained; after the murder, he is collected, and does not think of concealment. He testifies neither remorse nor repentance, nor satisfaction. Sometimes, satisfied, he proclaims that which he has done, and surrenders himself to the nearest magistrate; and describes the state of mind which led to the perpetration of the deed."

Means of defence are not then wanting against the pseudo-maniac, nor can there exist any dangerous peculiarity in the disease, which will stand in the way of substantial justice, where crime has really been committed.

We have only further to say, that Dr. Gavin's book will serve as a convenient index to the medical literature of his subject, and that the spirit which pervades his volume is that of an enlightened and humane philosophy.

Austria. By J. G. Kohl. In Two Parts.—Part I. *Vienna, Prague, Hungary, Bohemia, and the Danube.* Chapman & Hall.

To travel or not to travel—to stroll through the world, or to remain at home, and shoot out roots like a tree—were the perplexing doubts which troubled our worthy friend Kohl after his return from Russia. Fortunately for the public, he decided on abandoning all thoughts of a quiet little farm on the banks of the Elbe, and to trust himself to a Hungarian Bauerwagen, and commence a journey through the Austrian dominions. Kohl, as our readers know, is no idler—and no sooner had he set foot in Teplitz than forthwith he booked a group of Polish Jew pedlars, that might well serve our purpose, but that we had rather push on to Prague, and have a picture on a larger scale. The Jewish community of that ancient city is equal to one-fifth of its whole population. How long they have been settled there is a question open to discussion, and the disputants differ somewhere about a thousand years. Without offering an opinion on this subject, Kohl observes that the Jewish cemetery has all the outward appearance of great antiquity:—

"The cemetery lies in the very heart of the *Judenstadt*, where it is encircled by buildings and narrow lanes. Its form is very irregular, winding, now broad and then narrow, amid the houses that overtop its lofty wall. This very irregularity of form seems to speak in favour of the high antiquity of the place, to which, through succeeding centuries, a fragment seems now to have been added here, and now there. In the central part of the enclosed space, the tombstones are crowded together in a manner I never saw equalled anywhere else. Close to the wall, on the inside, is a footpath, and a man must walk tolerably fast to make the round in a quarter of an hour. The Jews do not, as we do, inter fresh corpses in graves whose former tenants have mouldered into dust, but always place their dead either over or by the side of each other. This practice occasions the astonishing accumulation of tombstones, of which I am sure there are several hundred thousand in this cemetery. They have all a family resemblance, being four-cornered tablets, with neatly-executed inscriptions. They stand literally as close together as ears in a cornfield. All are carefully preserved, though some have sunk more or less into the ground, so much so, that here and there you see a stone, of which only a portion is still visible. The whole is overgrown with elder bushes that stretch their knotty and confused branches from stone to stone. These elders are the only trees that grow there, and some of them seem to be nearly as old as the stones which they overshadow. The presence of the elder tree in burying-grounds is not, however, peculiar to this place, but prevails very generally throughout Bohemia. Here and there a small path winds among the thicket of tombstones and elder trees, and on following it you come to small elevated spaces of ground, that have been left unoccupied, and are now overgrown with grass. * * The inscriptions are nearly all in Hebrew. Nowhere did I see a Bohemian inscription, and only here and there, on a stone of comparatively modern date, has the German language been used. The year is always at the top. The tombs of those of Aaron's race are distinguished by two hands graven into the stone, and those of the Levites by a pitcher, to mark the office of the latter to pour water on the hands of the former, when performing their ablutions in the temple. The descendants of Aaron never visit the cemetery during their lives. Any contact with, or even a near approach to, a dead body, is a pollution for them. They may not, therefore, remain in a house in which a dead body is lying. There is but one exception made to this law, namely, when the father of an Aaronite dies, in which case the son may come within three ells of the body, and following it to the burying ground, till within three ells of a grave. The Jewish laws even prescribe the distance at which an Aaronite must keep when passing a burying-ground, which distance, however, is not calculated from the outer wall, but from the nearest grave. Now, in Prague, it happens that one street passes close to this wall, and that just in this spot the graves not only reach up to the very wall, but that some are even supposed to lie under the pavement of the street. This would, consequently, be a forbidden road to every Aaronite, had not particular arrangements been made to provide a remedy. This has been done by undermining that part of the street, and the empty vaulted space thus obtained, protects the Aaronite against pollution, for, according to the law, one hundred ells of vaulted space are deemed equal to one thousand filled with solid earth. Here, as in every other Jewish cemetery, a piece of ground has been set apart for the interment of children stillborn, or of premature birth. In the course of time, this portion of the cemetery has grown into a hill or mound, eighty paces long, ten paces broad, and twelve feet high. *Ephel* is the Hebrew word for a child whose life does not extend beyond the fourth week, and *Ephel* is the name given by the Jews to this mound formed of infantine remains. Close to this *Ephel* are situated some old houses that seem to be on the point of falling in. They are propped up by beams resting on the Ephel; thus the mouldering bones of deceased infants lend their support, perhaps, to the tottering dwelling-places of their living parents. When, some sixty years ago, the Emperor Joseph prohibited all future interments within the walls of the city, the Jews had purchased a small piece of land, and consecrated it as an addition to their cemetery. Having once been consecrated, though not one body has been interred there, the ground has become holy, and may not be sold again; but though it may not be sold, it may be let for hire, and accordingly a dealer in wood has become the tenant, and uses the place as a depot for his merchandise. The whole cemetery, since Joseph's time, has been only an interesting piece of antiquity, still no portion of it can be sold or built upon."

At the Cistertian convent of Osseg Kohl found a picture gallery, rich in legendary lore. One picture represented—

"A Cistertian of the name of Daniel, who studied and read so indefatigably in his solitude, that the flames of his holy zeal issued forth at his fingers' ends, so that he could hold them, at night, like so many little tallow candles before his book. This allegory is a beautiful one; for no doubt there is within the human breast a self-illuminating power, that enables the possessor to read the mysteries of God without the aid of a teacher; but in the way the painter has placed his subject before us, it loses all dignity, and looks rather as if the artist had designed to turn the matter into ridicule."

At the treasury of the Metropolitan church he records—

"In one cabinet I counted no less than 32 golden mitres. I took several of them in my hand, and observed to my guide that I thought them heavy. 'And yet, sir,' said the man, archly, 'our gentlemen are so very fond of wearing them!' In various drawers are preserved no less than 368 priestly vestments for the service of the mass, many of them of astonishing richness and splendour. One of them was of a material that might have furnished a mantle, either for a beggar or a prince; it was of common straw, but plaited and worked with such surprising art, that the whole looked like elaborate embroidery. Most of these vestments are gifts from Bohemian nobles, and the history of some of these presents may contribute to illustrate the character of the country. Thus, one vestment has been made up from the bridal dress of a Countess Tshernin, another of the coronation robes of Maria Theresa. One of the richest of all, and which is only displayed on occasions of great solemnity, has been decorated by the Prince Schwartzenburg with a number of golden bunches of grapes and vine-leaves, and with all the buttons worn on his wedding coat. Each of these buttons is a jewel of considerable value, fashioned into the form of an animal, and set in gold. What wasteful profusion! and what a strange whim, to dedicate the wedding dresses of lords and ladies to the service of the church!"

Kohl visited the celebrated University library—a university which once, according to tradition, contained 60,000 students! on which Kohl significantly observes, "unless it had more books than it has now, the whole library must have been exhausted if only each student occupied one work at a time." But it is not without some rarities.

"One of the most curious, is perhaps, a Hussite hymn-book, which is written and illuminated with singular splendour. The book, which must have cost many thousands of florins, was the joint production of a large portion of the inhabitants of Prague. Every guild and corporation of the city had a few hymns written, and pictures painted to accompany them, and several noble families did the same, each family or corporation placing its arms or crest before its own portion of the book."

The mention of Huss draws forth some reflections on that tremendous revolution, which shook Bohemia to its foundations, and has left no trace behind—a proof of the fallacy of the common assertion, that persecution only fans the flame it strives to put out. Let but the persecution be in earnest—no dallying with fire and sword,—no half measures,—and let Spain and Bohemia tell what may be effected by it. Mr. Kohl shall answer for Bohemia:—

"Poor Huss raised a flame in which he himself was burnt, as well as many that came after him, but from that flame posterity has derived neither light nor warmth. The history of the Calixtines of Bohemia is a sadder one than that of any other religious sect, for no doctrine ever made its way amid acts of greater violence, and none was ever annihilated by a more ruthless reaction. Lutheranism was also cradled amid fearful storms, but the tempests have spent themselves, and millions have become peaceful participators in the blessings at which Lutheranism aimed. The Hussites raised a mighty conflagration, of which the Austrians succeeded in treading out the last spark; the Lutherans lighted a roaring fire on their own hearths, and their homes, in spite of pope and emperor, have been warmed by its genial influence ever since. Yet Huss, despite of his heresy, lives in the affections of his countrymen. I have often observed in them a strange struggle, on this score, between religion and nationality. As Bohemians they love to take credit for all the great things

Digitized by Google

that the Hussites did, though as Catholics they cannot, of course, approve of them."

The lunatic asylum at Prague is spoken of as being very well conducted. The straight jacket is the only means of coercion or punishment employed, and every available means are taken to amuse the lunatics:—

"It is characteristic of music-loving Bohemia, that in the lunatic asylum of its capital, music should be considered one of the chief instruments for the improvement of the patients. In addition to the garden concerts, in which all assist who can, there are quartettos every morning and evening in the wards, and a musical director is appointed for the express purpose of superintending this part of the domestic arrangements."

One of the patients was the well-known Orientalist Sieber.

The beauty of the ladies of Prague, which struck Mr. Kohl as remarkable, gives rise to some speculations on the reason of their being so generally handsome:—

"That the little ugly, squalling, red-faced creatures (for all newly-born babies are alike) should grow up in Prague into such remarkably beautiful girls, is one of those phenomena of nature which I cannot take upon myself to explain. Some have attributed the fact to the mingling of German with Slavonian blood, but this the Slavonians protest against most loudly, telling you that in the villages of the interior, where no such mixture of the races has taken place, much finer specimens of female beauty are to be found, than in any of the frontier districts. The members of the Bohemian Patriotic Association boast, moreover, that by far the richest display of beauty is to be seen at their balls, where nothing but Bohemian is ever spoken, and where, consequently, the bulk of the company must be genuine Slavonian; nay, even the far-famed beauty of the Hungarian ladies is attributed by these zealous patriots to the mixture of Slavonian blood with that of the original races. The theory is not one that I would at once reject as absurd. On the contrary, I often fancied, in the course of my subsequent wanderings, that I saw reason to believe there was some ground for it. Be this, however, as it may, Prague is decidedly a very garden of beauty. For the young ladies of 1841, I am ready to give my testimony most unreservedly, and many an enraptured traveller has left us his books as living witnesses to the loveliness of the grandmothers and great grandmothers of the present generation. The old chronicler, Hammerschmidt, and his contemporaries, dwell with equal pleasure on the sweet faces that smiled upon them in their days, and the picture gallery of many a Bohemian castle is there to testify to the truth of their statements. One witness there is to the fact, whose right few will question to decide on such a point. Titian, who studied the faces of lovely women for ninety-six years, and who, while at the court of Charles V., spent five years in Germany, tells us, it was among the ladies of Prague, that he found his *idéal* of a beautiful female head. If we go back beyond the times of Titian, we have the declaration of Charles IV. that Prague was a *hortus deliciarum*, and whoever has read the Life of that emperor, will scarcely doubt that beautiful women must have been included in the delights of a capital so apostrophized. Nay, the time-honoured nobility of the beauty of Prague, may be said to go back even to the earliest tradition, where we find it celebrated in the legends of Libussa and Vlasta, and the countless songs composed in honour of the *Devïy Slavanske* or Tshekhian damsels."

The movement now going on in Bohemia is discussed by Mr. Kohl, who gives one remarkable instance of patriotic self-sacrifice. A Mr. Jungmann, a zealous Bohemian patriot, has lately published a dictionary of his country's language (the first good one that has ever been executed), and sold a vineyard to defray the expense. His compatriots, however, do not seem to have come forward very liberally to his aid: and this fact leads Mr. Kohl to doubt whether the feeling for liberty and their country be so strong and powerful among the Bohemians, as has been represented. He quotes the opinion of a Bohemian gentleman on the subject, which will possess some interest for our readers, and we will give it entire:—

"'It is a kind of luxury,' said he, 'in which a few idle young men indulge, and in which they are encouraged by the professors and antiquaries; but it is no movement originating in the wants, or emanating from the wishes, of the people. All that is eminent with us is German. Our men of education read Schiller and Goethe in preference to any other writers; every official man, down to the humblest clerk, writes and speaks German; and as every Bohemian feels that he cannot get on in the world without a knowledge of German, he seeks to learn it himself, and teach it to his children, and has no time to trouble himself about the fantastic visions of the Tshekhian patriots. Besides, the German language is taught, *ex officio*, in every school, and many of our gentry do not even understand the patois of the country. With all these mighty agents at work, what avail the efforts of a few enthusiasts? The government, meanwhile, feels itself strong enough to let the Tshekhian party go their own way. Foreigners, moreover, are deceived, if they attribute to politics all that is done here in the way of Slavonian investigation. The inquiring spirit of the time, the revived fondness of everything that tends to the illustration of antiquity, has led to similar efforts in other countries, as well as in those inhabited by Slavonians. Every province in Europe has been burnishing up its recollections; every city has been turning over the leaves of its chronicles, and repairing its cathedral or its town-house. Not only the Slavonian provinces, but all the provinces of Austria, have been collecting their antiquities, dusting their records, and new binding their chronicles. The same has been done in the provinces of Prussia, and indeed in the provinces of almost every European country. We have seen Ossian's literature rescued from its tomb in Scotland, and in Germany we have seen Voss writing poems in *Platt Deutsch;* we have seen Westphalian, Saxon, and Brandenburg Associations, not to speak of hundreds of other provincial societies; and thus the fashion has reached Bohemia at last. It is not any inclination on the part of the Western Slavonians to accept the fraternization offered them from the East, that has led to all these Slavonian journals, grammars, dictionaries, and poetical anthologies. In England, and even in France, books and newspapers have been printed in the local dialects, and so in Russia have works been of late published in Lettish and Esthonian, languages of which, some years ago, no cultivated man made use, unless perhaps in the pulpit. It is not to be denied, that the provincial, literary, and patriotic movements in the Slavonian provinces of Austria, acquire a peculiar character from the spirit of Panslavismus, of which so much has been heard of late years. No nation, while yet a breath of life is in it, becomes reconciled to the loss of its independence; and though the Bohemians, the Slovaks, and the other Slavonians, would do better to attach themselves more and more to the mild sceptre of Austria, than to stretch out their hands after the questionable independence which seems to be offered them from the East, yet nations, like individuals, are not exempt from acts of folly, prejudicial to others as to themselves; and for their own sake, therefore, as well as for Austria's, the Bohemians must be watched. The classes, however, which have most influence in the country, are the least disposed to sympathize with Russia. The clergy and the nobility know how little they would be likely to gain by exchanging the sovereignty of Austria for that of Russia. Recent events in Poland have likewise much contributed to cool the enthusiasm formerly manifested for Russia. The less instructed Bohemians, indeed, look upon much that they hear of Russia as mere German calumnies; but those among us, who stand higher, have had opportunities, many of them, of seeing with their own eyes. In short, should it ever come to a struggle between the Slavonian and German elements, the Tshekhs, in spite of their sympathies and antipathies, will be found fighting on the side of the Germans, and it will be for their own advantage to do so.'"

We must not forget the glass-warehouses of Prague, before we leave that celebrated city:—

"The workshops are generally at some distance in the country; but the warehouses in Prague, for the greater part, are the property of the manufacturers. These have chemists and artists in their pay, who are constantly tasking their invention to extend the domains of glass, by discovering new articles that may admit of being formed of so brittle a material, and to give new colours and forms to those articles which the glass-cutters have long looked upon as belonging to their legitimate sphere. Of each new discovery or modification a drawing is made, and a copy sent to the manufactory. The drawing and the copy bear corresponding marks and numbers, so that if a sudden demand comes to the warehouse for any particular article, all that is necessary probably is to send an order down to the country, to make up immediately so many dozens of B 288, or whatever else the number may be. I was allowed to look over a number of these drawings, which were neatly bound up in folio volumes, and I was astonished at the immense variety of designs and inventions for coffee, tea, and milk pots; at the endless modifications of form which so simple an article as a glass stopper was made to undergo; and at the prodigality of ingenuity that had been expended on varying the conformation of a thing so unimportant as a lady's smelling-bottle. In the different shades of colour there was almost as much variety as in the form; yet the prevailing taste appears to be always, in the long-run, in favour of that which is most simple. The plain, pure, colourless, crystalline glass has always been in favour, and will maintain its supremacy in the end, however taste may sport for awhile among the brilliant colours and variegated forms which science has found the means of imparting to this beautiful manufacture. All the bright 'Leonore greens' and 'Chrysopras' of 1840, and the 'Anne green,' the 'gold glass,' the 'dead glass,' and the 'alabaster' of 1841, may hold their place in public favour for a time; but they will have passed away, when the pure crystal will be prized as much as ever."

We must conclude for the present with a sketch of a Bohemian railway—

"The Linz-Budweis railroad is the grandmother of all the railroads on the European continent; and taking this into consideration, we must not deem it matter of surprise to find it manifesting occasionally some symptoms of the debility of old age. It was the *coup d'essai* of Baron von Gerstner, who afterwards laid down rails in Russia, and died in America. He had great natural difficulties to contend with in the mountainous region over which his road had to be carried. To overcome these difficulties he was obliged to make his railroad take so circuitous a route, that though the distance between the two towns, in a straight line, is not more than ten (German) miles, the railroad has a length of seventeen. After arriving at Linz, the railroad is carried ten miles further to Gmünden, for the convenience of the government salt-works at that place. The railroad from Budweis to Linz cost 1,700,000 florins. It consists of a single pair of rails, with arrangements at intermediate stations to enable two trains to pass each other. The rails are partly of Styrian, but chiefly of Bohemian iron; partly cast and partly wrought. In many places they seem sadly in want of repair. Some have been completely worn away, others have lost their nails, and stand up from the wooden sleepers to which they were originally fastened. Sometimes a very sensible jolt of the carriages reminds the passengers of a striking difference between the respective altitudes of two succeeding rails; at other times a drag must be put upon the wheels, to prevent the train from rattling down the hill at too rapid a pace. My journey was performed immediately after rainy weather, which had made the rails extremely dirty and slippery; and I find, from a memorandum in my journal, that our wheels occasionally sunk into soft earth. It is evident from all this, that this railroad must have been left in a very neglected condition; but its importance to the commerce of the Danube is so great, that the government will be obliged, before long, to step in, and, by a timely treatment, endeavour to save this grandmother railroad from an untimely fate. The trains on this railroad are drawn by horses, and owing to the inequalities of the ground over which it passes, there is little likelihood that steam locomotives can ever be introduced there. One horse generally draws two or three carriages; but sometimes two or three horses are yoked on, in which case the train consists of six,

Digitized by Google

seven, or even eight carriages. On an average, a horse is able to draw from seventy to a hundred cwt. at a slow walk; the trains for passengers travel at a smart trot. On the common road, in this mountainous district, a horse cannot draw more than twelve cwt."

Aunt Elinor's Lectures on Architecture, dedicated to the Ladies of England. Rivingtons.

BRIEF as it is, the title-page of this little volume says a great deal, intimating as it does that we may expect shortly to have not only additional *lay*, but also *lady* students in architecture. Multifarious as are the pursuits and accomplishments of modern female education, women have hitherto been privileged to avow utter ignorance of architecture, although it ranks as one of the fine arts. It may indeed be said that as an acquirement, it would be quite useless to them; yet at that rate a good many other female studies might be put under ban. What is there of particular and obvious utility to women in the study of botany, mineralogy, conchology, geology, and some of the many other *ologies* to which they apply? or in that of chemistry when they scorn to cultivate that truly domestic species of it—the chemistry of the kitchen? Surely it would be quite utility enough if the study of architecture afforded them an intellectual occupation which would tend to improve their taste, and enable them to relish far better than they can do at present, an extensive and varied department of art. Besides, in this age of travellers and tourists, some knowledge of architecture becomes almost indispensable, since without it those who visit foreign cities are very much in the condition of a blind man in a gallery of pictures;—or if they see, they must both see and afterwards speak according to the traveller's oracle—the 'Guide-Book.'

Very easily might we extend these remarks; but what we have said will serve to call attention to what is one particular object of Aunt Elinor's work. Still, while we are willing to hail her book as being in that respect of favourable augury, we do not approve of all "Aunt's" views; nor can we by any means compliment her on having produced a work likely to render the study attractive to females. So far from being at all "popular" and calculated to interest the beginner, her mode of teaching is exactly the reverse; nor does she seem to have any idea of the difficulties that are most likely to be felt at the outset, and ought therefore to be cleared away in the first instance. Even where no more than a mere sketch or introductory outline of a subject is professed to be given, brevity alone does not tend to facilitate an acquaintance with it; on the contrary, rather to cause it to appear dry, fatiguing, and uninteresting.

This has always appeared to us one great defect of most elementary books: professing to be familiar, and to serve as a "short cut" to the subject treated of, they are frequently very difficult and obscure; and no wonder, for instead of being composed with a view to their particular purpose, many of them seem to be only the siftings obtained from more complete treatises, by no other process of abridgment than that of mere erasure,—of omitting what may appear superfluous for a beginner, but without attempting to supply that explanation which is indispensably requisite for him. One important point in the art of teaching is to put the learner in the way of teaching himself; which is certainly not to be accomplished by affording him only partial and indistinct glimpses of the subject. It is true that having obtained some general insight into it, from a slight introductory sketch, the student may afterwards enter into it as fully as he pleases, and where there is a strong natural relish for it, such will be the case; but then how many are there who abandon it in despair or disgust, owing to no interest having been imparted to it in the books that have professed to initiate them into its rudiments.

Aunt Elinor's first Lecture, which is on the subject of the ancient orders, affords a very notable specimen of that mode of elementary instruction which we are inclined to deprecate. It cannot, indeed, be objected, that it is tediously long, but it certainly is miserably dry and jejune, amounting to no more than a few bare definitions, without attempt at explanation or instructive comment. The characteristics of the respective orders are merely specified without being described, much less accounted for; and what is not a little singular, no notice is taken of their proportions, not even so as to give an idea how those proportions are computed, and that the lower diameter of the column is taken as a scale for the whole order. Neither is information afforded as to anything further than the general composition of an order by itself, without reference to the mode in which it is employed. It may, therefore, easily be guessed how far the beginner is put into a proper and intelligent way of study.

It may, perhaps, be some excuse for this lame and bald account of the ancient orders, that it may be passed over altogether, as having no connexion with what follows; for though it is not so intimated by the title, these Lectures do not treat of architecture generally, but merely of that of our own country, and only one particular class of it—namely, the Ecclesiastical. Consequently, Lectures on Church Architecture would have been a more suitable title,—hardly a less catching one just now, and it would have in some degree prepared us for the religious and polemical tone, which is not the least striking characteristic of the volume. Aunt Elinor is, in fact, a sort of Protestant Pugin in petticoats, almost equally hostile towards Pagan art, (with this difference, that she imputes its encouragement in modern times to popes and cardinals) —and equally disposed to rail at this money-making, steam-going, self-sufficient nineteenth century, for subduing and changing whose spirit they seem to consider Church Architecture an all-sufficient panacea.

Accordingly, not contented with "lecturing," Aunt Elinor must needs take upon herself to preach also; and preach she does, after a fashion that must have been more bewildering than instructive to her auditors, supposing her lectures to have been really delivered before children for their winter evening's amusement. Dealing in architectural mysticism, and laying very great stress upon symbolical meaning in design,* she attempts to render the study *edifying* in more meanings of the word than one; yet whether such views be, or be not, correct in themselves, they are altogether out of place in what purports to be a course of elementary instruction. Considered from this point of view, the book is unsatisfactory; at least, not more satisfactory than others of the kind, for although it contains much information, it omits a great deal which must first be understood, in order to render that information available and instructive. The writer strides too rapidly over the ground, and jumps over many essential particulars; the book will therefore hardly help those who now first seek information on the subject,—if only because the respective architectural members and features are neither described nor delineated, but spoken of as if sufficiently well known. All that is given in the way of illustrations are five specimens of arches and the heads of doorways, which seem to have been taken at random, and which certainly are utterly inadequate to convey any notion of the multifarious elements and characteristics of so complex and diversified a style, or series of styles, as the Gothic. We are aware that in order to elucidate such style of architecture satisfactorily, a most extensive series of illustrations would be required; and it is, no doubt, owing to this circumstance, that numerous as are the publications on Gothic architecture, there is not yet any single one which furnishes a complete and systematic course of instruction. The subject is treated rather historically than elementarily, and with comparatively very little of architectural or critical remark, properly so called. It is true a great stock of information has now been provided, but it is scattered about fragmentarily, and the student has to collect and arrange it for himself. Attention is directed rather to dates and matters of history than to architectural principles and characteristics, except as these last serve to discriminate one period of the style from another, as its indicial marks. The consequence is, that in copying, the real spirit of the style is missed, though such "marks" are kept up; no account being taken of a variety of circumstances, all more or less influential in design, yet which do not admit of being described or defined like the separate members and positive features of an edifice.

It would, perhaps, be too much to expect that Aunt Elinor should be the first to direct attention to matters of the kind just alluded to, especially when she could find such a topic to expatiate upon as that of "Fonts and Altars," to which she devotes an entire lecture! The Font is considered by her, if not exactly as an object of devotion, one to which peculiar sanctity is attached, therefore not to be treated as mere matter of taste, but according to orthodox precedent. Yet how far ancient precedents can always be followed with propriety, is, upon her own showing, somewhat doubtful, since she informs us—

"At St. Nicholas' Church, Brighton, there is a very curious font, which some persons have imagined to be a trick upon antiquaries, *i. e.* an imitation of an early Norman font, carved in modern times. The clearness and freshness of the sculpture is wonderful; the figures are grotesque and ludicrous, yet there is spirit and expression in some of them. One side represents the sacrament of the Lord's Supper; our Saviour is in the act of blessing the bread, and the Apostles lift up their hands and eyes in utter amazement at the miraculous change. If this font be really ancient, then there is nothing irreverent about it, as the figures carved by a rude people would not be ludicrous in the eyes of those who could make nothing; but if it be the work of a modern artist, and executed by way of joke, it is a melancholy specimen of perverted skill—I may say of shocking profaneness."

It would seem, then, after all, that propriety or impropriety in such matters depends greatly upon circumstances, and that the very same thing may be either becoming or objectionable according to the particulars of the case. This cannot be altogether disputed, yet, being admitted, it rather makes against the writer's views than for them, since what is said tends to show that what would formerly have been harmless, may now be reprehensible, not to say scandalous. If the figures alluded to be actually "grotesque and ludicrous," it matters not, as far as we are concerned, whether their being so is the result of ignorance and bad taste, or of malicious intention; to us they seem ludicrous, consequently for us they are improper. The case is the same with many other things and matters on which this writer and the Church Revivalist party lay great stress. Many forms and observances, which some centuries ago were in accordance with the then spirit of the age, would, at the

* Of the fanciful notions entertained by some on this subject, an idea may be formed from what is said relative to it, in a notice of Lewis's 'Illustrations of Kilpeck Church,' (*Athen.* No. 778).

Digitized by Google

present day, appear both superstitious and fantastic—at the best, unmeaning. Had they been kept up in full force till now, it might have been a question how far it would be prudent to lay them aside; but to attempt to revive them, as is now being done, after they have long become obsolete, is a different matter from merely retaining what had never been discontinued. The reform or change in regard to matters of ceremonial or etiquette in church service and church architecture, which is now contended for in certain quarters, is, in itself, hardly worth the clamour and scandal it has occasioned; therefore, suspicion is very naturally excited, and room is afforded for supposing that the real object is as yet kept in the background, and that having been enticed to return to forms, we are to be trapped into returning to doctrines. If it is not meant to re-enlist us under the banners of Romanism, why should we be asked to put on its colours, and wear what looks like its badge?

Of Romanism there is certainly some *tinge* in Aunt Elinor's Lecture; nor does she confine herself very strictly to matters of church architecture alone, but expatiates on other topics, some of them hardly suited to her auditors. Not content with recommending religious embroidery, and the meritoriousness of presenting altar-cloths and other ornamental productions of needle-work to churches, she goes on to advocate female celibacy on religious motives. Celibacy among women, and that from choice, is, she assures us, on the increase, notwithstanding that, as she oddly expresses it, "*certainly* the education so common now-a-days, unfits women for a single life to a remarkable degree." We are not skilled in the statistics of matrimony, and the subject is rather too delicate for discussion; but it is not easy to reconcile the prodigious increase of population with Aunt's assumed growing popularity of celibacy. It is, however, upon such grounds that she founds an argument for such change in female education and pursuits as would serve as a preparation and training up for a life of "single blessedness."

We have said enough to give an idea of the peculiar views inculcated in these Lectures, which are by no means confined to architectural subjects.

Wyandotté, or the Hutted Knoll. By J. Fenimore Cooper. 3 vols. Bentley.

To those readers who find the chief attraction of Mr. Cooper's novels in his narratives of "moving accidents by flood and field," his accounts of hair-breadth escapes from Indian savages or government cruisers, we cannot promise much interest in 'Wyandotté:' even to those who are wont to be gladdened by the joyous descriptions of scenery wild and free, with which this author's tales generally abound, we can offer less than their usual treat; while to all those who prefer a calm and domestic peace, and everyday unheroic trials and characters, we can promise a full and fair enjoyment. There is scarcely a scene of wild interest in the whole tale, and yet it is not tiresome or tedious. It relates the fortunes of a British officer and his family, settled near the Susquehannah, on a spot called "The Hutted Knoll," at the outbreak of the American revolution. The progress of the family to their future home is thus described: Capt. Willoughby, with his daughter, his adopted daughter, and his wife, leave the town of Albany for their wild habitation.

"Mrs. Willoughby had often overcome, as she fancied, the difficulties of a wilderness in the company of her husband.—It is the fashion highly to extol Napoleon's passage of the Alps, simply in reference to its physical obstacles. There never was a brigade moved twenty-four hours into the American wilds, that had not greater embarrassments of this nature to overcome, unless in those cases in which favourable river navigation has offered its facilities. Still, time and necessity had made a sort of military way to all the more important frontier points occupied by the British garrisons, and the experience of Mrs. Willoughby had not hitherto been of the severe character of that she was now compelled to undergo. —The first fifty miles were passed over in a sleigh in a few hours, and with little or no personal fatigue. This brought the travellers to a Dutch inn on the Mohawk, where the captain had often made his halts, and whither he had, from time to time, sent his advanced parties in the course of the winter and spring. Here a jumper was found prepared to receive Mrs. Willoughby; and, the horse being led by the captain himself, a passage through the forest was effected as far as the head of the Otsego. The distance being about twelve miles, it required two days for its performance. As the settlements extended south from the Mohawk a few miles, the first night was passed in a log cabin on the extreme verge of civilization, if civilization it could be called; and the remaining eight miles were got over in the course of the succeeding day. This was more than would probably have been achieved in the virgin forest and under the circumstances, had not so many of the captain's people passed over the same ground going and returning, thereby learning how to avoid the greatest difficulties of the route, and here and there constructing a rude bridge. They had also blazed the trees, shortening the road by pointing out its true direction. —At the head of the Otsego our adventurers were fairly in the wilderness. Huts had been built to receive the travellers; and here the whole party assembled, in readiness to make a fresh start in company. It consisted of more than a dozen persons in all; the black domestics of the family being present, as well as several mechanics whom Captain Willoughby had employed to carry on his improvements. The men sent in advance had not been idle, any more than those left at the Hutted Knoll. They had built three or four skiffs, one small bateau, and a couple of canoes. These were all in the water, in waiting for the disappearance of the ice, which was now reduced to a mass of stalactites in form, greenish and sombre in hue as they floated in a body, but clear and bright when separated and exposed to the sun. The south winds began to prevail, and the shore was glittering with the fast-melting piles of the frozen fluid, though it would have been vain yet to have attempted a passage through it.—The Otsego is a sheet of water which we have taken more than one occasion to describe, and the picture it then presented amidst its frame of mountains will readily be imagined by most of our readers. In 1765, no sign of a settlement was visible on its shores, few of the grants of land in that vicinity extending back so far. Still the spot began to be known; and hunters had been in the habit of frequenting its bosom and its shores for the last twenty years or more. Not a vestige of their presence, however, was to be seen from the huts of the captain: but Mrs. Willoughby assured her husband, as she stood leaning on his arm the morning after her arrival, that never before had she gazed on so eloquent and yet so pleasing a picture of solitude as that which lay spread before her eyes.—'There is something encouraging and soothing in this bland south wind, too,' she added, 'which seems to promise that we shall meet with a beneficent nature in the spot to which we are going. The south airs of spring to me are always filled with promise.'—'And justly, love; for they are the harbingers of a renewed vegetation. If the wind increase, as I think it may, we shall see this chilling sheet of ice succeeded by the more cheerful view of water. It is in this way that all these lakes open their bosoms in April.'"

After a few amusing incidents, in which a blundering Irish servant figures conspicuously, they cross Lake Otsego, and soon arrive at their destination, which is thus introduced to the reader:—

"The appearance of a place in which the remainder of one's life is to be passed is always noted with interest on a first visit. Thus it was that Mrs. Willoughby had been observant and silent from the moment the captain informed her that they had passed the line of his estate, and were approaching the spot where they were to dwell. The stream was so small, and the girding of the forest so close, that there was little range for the sight: but the anxious wife and mother could perceive that the hills drew together at this point, the valley narrowing essentially; that rocks began to appear in the bed of the river; and that the growth of the timber indicated fertility and a generous soil. When the boat stopped, the little stream came brawling down a ragged declivity; and a mill, one so arranged as to grind and saw, —both in a very small way, however,—gave the first signs of civilization she had beheld since quitting the last hut near the Mohawk. After issuing a few orders, the captain drew his wife's arm through his own, and hurried up the ascent, with an eagerness that was almost boyish, to shew her what had been done towards the improvement of the 'Knoll.' There is a pleasure in diving into a virgin forest, and commencing the labours of civilization, that has no exact parallel in any other human occupation. That of building, or of laying out grounds, has certainly some resemblance to it, but it is a resemblance so faint and distant as scarcely to liken the enjoyment each produces. The former approaches nearer to the feeling of creating, and is far more pregnant with anticipations and hopes; though its first effects are seldom agreeable, and are sometimes nearly hideous. Our captain, however, had escaped most of these last consequences, by possessing the advantage of having a clearing, without going through the usual processes of chopping and burning; the first of which leaves the earth dotted for many years with unsightly stumps, while the rains and snows do not wash out the hues of the last for several seasons. An exclamation betrayed the pleasure with which Mrs. Willoughby got her first glimpse of the drained pond. It was when she had clambered to the point of the rocks where the stream began to tumble downward into the valley below. A year had done a vast deal for the place. The few stumps and stubs which had disfigured the basin when it was first laid bare, had all been drawn by oxen, and burned. This left the entire surface of the four hundred acres smooth and fit for the plough. The soil was the deposit of centuries; and the inclination, from the woods to the stream, was scarcely perceptible to the eye. In fact, it was barely sufficient to drain the drippings of the winter's snows. The form of the area was a little irregular, just enough so to be picturesque; while the inequalities were surprisingly few and trifling. In a word, nature had formed just such a spot as delights the husbandman's heart, and placed it beneath a sun which, while its fierceness is relieved by winters of frost and snow, had a power to bring out all its latent resources. Trees had been felled around the whole area, with the open spaces filled by branches, in a way to form what is termed a brush fence. This is not a sightly object, and the captain had ordered the line to be drawn *within* the woods; so that the visible boundaries of the open land were the virgin forest itself. His men had protested against this; a fence, however unseemly, being in their view an indispensable accessory to civilization. But the captain's authority, if not his better taste, prevailed; and the boundary of felled trees and brush was completely concealed in the back-ground of woods. As yet, there was no necessity for cross-fences, the whole open space lying in a single field. One hundred acres were in winter wheat. As this grain had been got in the previous autumn, it was now standing on the finest and driest of the soil, giving an air of rich fertility to the whole basin. Grass-seed had been sown along both banks of the stream, and its waters were quietly flowing between two wide belts of fresh verdure, the young plants having already started in that sheltered receptacle of the sun's rays. Other portions of the flat showed signs of improvement, the plough having actually been at work for quite a fortnight. All this was far more than even the captain had expected, and much more than his wife had dared to hope. Mrs. Willoughby had been accustomed to witness the slow progress of a new settlement; but never before had she seen what might be done on a beaver-dam. To her all appeared like magic; and her first question would have been to ask her husband to explain what had been done with the trees and stumps, had not her future residence caught her eye. Captain Willoughby had left his orders concerning the house,

Digitized by Google

previously to quitting the Knoll; and he was now well pleased to perceive that they had been attended to. As this spot will prove the scene of many of the incidents we are bound to relate, it may be proper here to describe it at some length. The hillock that rose out of the pond, in the form of a rocky little island, was one of those capricious formations that are often met with on the surface of the earth. It stood about thirty rods from the northern side of the area, very nearly central as to its eastern and western boundaries, and presented a slope inclining towards the south. Its greatest height was at its northern end, where it rose out of the rich alluvion of the soil, literally a rock of some forty feet in perpendicular height, having a summit of about an acre of level land, and falling off on its three sides,—to the east and west, precipitously; to the south, quite gently and with regularity. It was this accidental formation which had induced the captain to select the spot as the site of his residence; for, dwelling so far from any post, and in a place so difficult of access, something like military defences were merely precautions of ordinary prudence. While the pond remained, the islet was susceptible of being made very strong against any of the usual assaults of Indian warfare; and, now that the basin was drained, it had great advantages for the same purpose. The perpendicular rock to the north even overhung the plain; it was almost inaccessible: while the formation on the other sides offered singular facilities both for a dwelling and for security."

The wild desert is soon taught to blossom as the rose, and, some time after, we have the description of the Hutted Knoll:—

"The forest is opened, and the light of day admitted, it is true; but its remains are still to be seen in multitudes of unsightly stumps, dead standing trees, and ill-looking stubs. These vestiges of the savage state usually remain a quarter of a century; in certain regions they are to be found for even more than twice that period. All this, however, had Captain Willoughby escaped, in consequence of limiting his clearing, in a great measure, to that which had been made by the beavers; and from which time and natural decay had, long before his arrival, removed every ungainly object. It is true, here and there a few acres had been cleared on the firmer ground at the margin of the flats, where barns and farm buildings had been built, and orchards planted; but in order to preserve the harmony of his view, the captain had caused all the stumps to be pulled up and burnt, giving to these places the same air of agricultural finish as characterized the fields on the lower land. To this sylvan scene, at a moment which preceded the setting of the sun by a little more than an hour, and in the first week of the genial month of May, we must now bring the reader in fancy. The season had been early, and the Beaver Manor, or the part of it which was cultivated, lying low and sheltered, vegetation had advanced considerably beyond the point that is usual at that date in the elevated region of which we have been writing. The meadows were green with matted grasses, the wheat and rye resembled rich velvets, and the ploughed fields had the fresh and mellowed appearance of good husbandry and a rich soil. The shrubbery, of which the Captain's English taste had introduced quantities, was already in leaf, and even portions of the forest began to veil their sombre mysteries with the delicate foliage of an American spring. The site of the ancient pond was a miracle of rustic beauty. Everything like inequality or imperfection had disappeared, the whole presenting a broad and picturesquely-shaped basin, with outlines fashioned principally by Nature—an artist that rarely fails in effect. The flat was divided into fields by low post-and-rail fences, the captain making it a law to banish all unruly animals from his estate. The barns and out-buildings were neatly made and judiciously placed, and the three or four roads or lanes that led to them crossed the low-land in such graceful curves as greatly to increase the beauty of the landscape. Here and there a log cabin was visible, nearly buried in the forest, with a few necessary and neat appliances around it; the homes of labourers who had long dwelt in them, and who seemed content to pass their lives in the same place. As most of these men had married and become fathers, the whole colony, including children, notwithstanding the Captain's policy not to settle, had grown to considerably more than a hundred souls, of whom three-and-twenty were able-bodied men. Among the latter were the millers: but their mills were buried in the ravine where they had been first placed, quite out of sight from the picture above, concealing all the unavoidable and ungainly-looking objects of a saw-mill yard."

With these extracts we dismiss 'Wyandotté,' recommending it to the favourable consideration of our readers.

OUR LIBRARY TABLE.

Cowper's English Version of the Odyssey of Homer: with a Commentary in Explanation of the practical Purposes of the Text, by OY TIΣ, F.R.S., &c.—The noticeable thing in this neat edition is the running commentary on the "mystic sense" of the Poem. Therein if he have but faith, the reader will find much curious information. Homer, it seems, should take rank "among the prophets"; for in his capacity of prophet he foresaw all the evils of modern society—and these he has foreshadowed, not dimly or in vague generalities, but with minute particularity. Thus Proteus represents a smuggler, "hanging out the flags of all nations by turns, rather than fail of his object": Menelaus is "the chancellor of the University of Argos," making his interest and power "the introduction to an easy and tranquil old age in retirement"; and so on. This tendency to particularize is shown most clearly in the interpretation of the allegory of Scylla and Charybdis. With regard to Scylla the editor is rather in doubt. "It *may* be the *press-gang*, formerly the mariner's greatest and most flagrant grievance; it may be the practices of crimps, and fraudulent dealers of various classes, on his newly replenished purse; it may be even the police of a seaport; but there are features in the picture which agree strictly with none of these. It *may* be, lastly, in irony, that very harmless place of resort (provided a man have money in his pocket to pay withal), the cook's shop! But the name of Crataïs (*krataiis*, vis magna) seems to assign to the government the origin of the pest; from the operation of which the hero is here advised to secure his men by a 'protection.'" As to Charybdis, with its ebb and flow thrice a day, there can be no mistake: it is the pawnbroker's shop, wherein "thrice a day (it should seem in that age) they let in the poor to pawn their property and thrice to redeem." Did we not think this sufficient, we could inform our readers how that the Sirens represent balls and concerts to which the superior officers give themselves a dispensation to go, while "the hands" and all on duty are expected to stay on board; we could show them how that a gold cup "perhaps made by Tubal Cain" came into the possession of Phœdimus, "if Phœdimus be Solomon," together with other equally probable suppositions. The scholar, too, may gain from this commentary much information on etymology.

A Statement of Facts in relation to the recent Ordination in St. Stephen's Church, New York, by Drs. Smith and Anthon.—It would seem from this pamphlet that Puseyism is spreading in America, as according to the statements here made, the Rt. Rev. Dr. Onderdonk, Bishop of New York, with six presbyters, consented to the ordination of a Mr. Carey in spite of the remonstrances of Drs. Smith and Anthon, the remaining two of the college of presbyters, who accuse the candidate for ordination of holding Romanist principles, decidedly opposed to those of the Protestant Episcopal Church of America. Beyond this statement of facts we have, of course, nothing to do with the question.

A Glossary to 'By-gone Hours,' by Dry Nurse.—A poet here protests against the injustice of the critics toward a brother poet,—the author of 'By-gone Hours.' The Glossary opens with an imaginary dialogue between the poets, in which 'By-gone Hours' consoles himself that—

> Future generations
> Shall honour, with applauses loud and long,
> The poet's genius, and the child of song.

To which Dry Nurse replies:—

> Such thoughts are very pleasant,
> I only wish they'd praise you more at present.

With a self-devotion worthy of admiration, Dry Nurse adds some "Imitations" of his friend's Epigrams, by the inferiority of which to those of the "great original" he hopes, we suppose, to impress the reader with an idea of the terseness and pathos of the elder poet. Thus, says By-gone Hours:

> The short-lived Rose, before to-morrow's dawn,
> Bereaved of bloom, scarce differs from a thorn.

Thus imitated:—

> The grass that I saw in the meadow to-day,
> When it's cut down, will scarce differ from hay!
> And true it is, if you're out when it rains,
> All that you get, is—wet through for your pains.

Again:—

> The strictly honest, and the truly brave,
> Despise alike the treacherous knave.

Now, *haud passibus æquis*, Dry Nurse:—

> An honest man and a naughty thief
> Are not alike, it's my belief.

As our judgment has been appealed from, we leave the question as desired to "future generations."

Gleanings from the South, East, and West—consists of a tale entitled 'The Huguenot Family,' the scene of which is partly laid in South Africa,—'The Cingalese Converts,' a story whose title conveys a sufficient description of its localities,—and 'The Two Bridals,' a West Indian romance. They are compounded of good feeling and commonplace in about equal quantities.

Aunt Martha; or the Spinster.—The title of one of Miss Mitford's prettiest sketches is here prefixed to a small romance of some sixty pages; good neither for old nor young, and beneath the average of Annual fiction.

The Character of the Rev. W. Palmer as a Controversialist considered, in a Letter to a Friend at Oxford.—Here we have Greek meeting Greek, Roman Catholic meeting Anglo Catholic, on the very debateable ground of the Fathers. For our parts we believe that "both are right and both are wrong"; the Fathers, with admirable impartiality, having written on one side as much as on the other. Had poor Vincent of Lirens imagined what a sensation his unfortunate canon would make, we doubt whether he would have bequeathed such a bone of contention to posterity.

The Philosophy of Training, by A. R. Craig.—This little work contains some sound remarks, mixed, as usual in books of the kind, with many fallacies. The author thinks it necessary to attack the systems and discipline of the Cam and Isis, regarding which he seems wholly ignorant. What can he mean by the copies of Greek Pentameters written at Oxford, as qualifications for "prizers"? There are legitimate causes enough of complaint against our Universities; why invent others?

A Voice from the Holy Land, edited by Rev. E. Mangin, M.A.—A little work, in the style of the Athenian Letters; purporting to be the letters of a centurion in Judea, at the time of the preaching and death of the Messiah, to a friend at Rome. The letters are unobjectionable, but wanting in originality and power.

Canada, Nova Scotia, &c., in regard to Emigration. A useful little manual for emigrants, but, like most works of the kind, it does not enter sufficiently into particulars.

The New Torquay Guide, by Democritus Tertius.—Democritus Tertius is no Anstey *redivivus*, though he uses the slipshod rhyme of 'The New Bath Guide,' with fluent and feeble pleasantry, to describe the beauties of one of the fairest haunts of the West Country. The quiz on Dr. Granville, who, it will be recollected, gave "scrimp measure" of praise to Torquay, is the most pungent portion of his *brochure*.

Jerusalem as it was, and as it is, translated from the German, by Sophia Taylor.—A neat little abridgment of the larger works of Raumer, Schubert, Robinson, Fisk, &c. It might have been extended with advantage, but, brief as it is, it forms an interesting volume. The translation has been executed with judgment.

The Ottoman and Spanish Empires in the Sixteenth and Seventeenth Centuries. The History of the Popes in the Sixteenth and Seventeenth Centuries, by Leopold Ranke: translated by W. K. Kelly.—These two works together form the four volumes of the original German edition called collectively, 'Sovereigns and Nations of Southern Europe in the Sixteenth and Seventeenth Centuries.' No doubt can be entertained as to Ranke's merits as a historian, and he appears, on a hasty glance, to have been faithfully rendered by Mr. Kelly.

OUR WEEKLY GOSSIP.

It is with deep regret that we announce the death of Sir T. Charles Morgan—one of the best men it was ever our good fortune to be associated with, either in public or private life. We dare not, at this moment, trust ourselves to speak of him as our heart dictates. What would seem extravagant eulogy to those who knew him not, or knew him only under the chilling influences of general society, would but imperfectly express our feeling, and be read but as a poor and unworthy testimony to his virtues by those who had the honour and the happiness of an intimate acquaintance with him. He was a man of a refined and philosophic mind, and varied accomplishments—a scholar and a gentleman in the largest sense of those comprehensive words. Though essentially a social man, he was not, in our opinion, especially qualified to shine in society. He recognized, indeed, and at its full value, the graceful ease of manners and opinion which best enables men to glide smoothly through life; but he would rather commend than imitate it; though tolerant of all differences, he was too honest to trifle with truth, and too earnest to smooth and polish it down to that true no-meaning which is the current coin of conversation in our day,—an indignant or a generous impulse was sure to break through conventional usage. In his family, or among friends whom he loved and trusted, he was simple and gentle as a child—always cheerful, always ready for a laugh or a joke, with an anecdote or a pun—no matter what, so it made those around him happy. He was open to all generous and genial influences, and sensitive as a woman to the feelings of others; nothing was insignificant that enabled him to give pleasure. We are personally indebted to him for so many acts of kindness and consideration, that we feel, at this moment, "poor even in thanks."—To come to those barren facts which are expected in the briefest of obituary notices: Sir Charles Morgan was the son of John Morgan, Esq., for many years resident in Charlotte Street, Bloomsbury. He was sent when very young to Eton, but removed to the Charterhouse. He entered at Cambridge in his eighteenth year, and was distinguished there as a Greek scholar; and, as we have heard his contemporaries say, for his uncompromising opinions, and the power and metaphysical acuteness with which he maintained them. There, in due course, he took his Doctor's degree, and soon after married the daughter of Mr. Hammond, of the Stock Exchange. On the death of this lady, by whom he had one daughter, he accompanied the late Marquis of Abercorn to Ireland, and there married Miss Owenson, and settled in Dublin. Embracing with all the earnestness of his nature the cause of his adopted country, he contributed his time and talent, in joint labour with his wife, to promote its interests, and, above all things, Catholic Emancipation. Besides those chapters on Science, Politics, and Statistics, which he added to Lady Morgan's 'France' and 'Italy,' he published 'The Philosophy of Life,' and 'The Philosophy of Morals,' works which drew down upon him, in those days of triumphant assumptions, the persecution of opinion—

Far worse to bear
Than violence—

but which he bore, with all its consequences, cheerfully, for it was, as he believed, in the cause of truth. It was some consolation to know that these works were welcomed on the continent, and translated into French, under the supervision of the Count de Tracy, one of the most distinguished metaphysicians of his age and country. In 1837, a desire for the best medical advice, in consequence of Lady Morgan's threatened loss of sight and declining health, with circumstances of a private nature, induced him to return to and settle in London. He wrote other works—amongst them we remember 'The Mohawks,' a satirical poem, with notes—and was for many years a contributor to one or other of the more distinguished periodicals.—But we must conclude this hurried notice. We have not attempted a biography—the cloud that overshadows us must pass away before we venture to recal the thousand circumstances that won for him our regard—and ere then we hope some abler pen will do justice to his memory.

As the reader may suppose, we are in no humour for trifling, and shall therefore allow more licence than usual to a correspondent. "If you care for a bit of gossip architectural, the late doings at Wisbeach, on the occasion of laying the first stone of a small cemetery chapel, might be referred to as of an extraordinary character, it having been made—not very decorously, perhaps—the pretext for protracted festivities during several days. In addition to the attraction of a Fancy Bazaar, there was a Concert and Ball, a Picture Exhibition, and also an Exhibition of Fireworks! which last alone, it is said, must have cost at least 40*l.*, to say nothing of the expense incurred by profuse hospitality—keeping open house for guests of distinction during the whole week—so that the party might as well have undertaken to build the chapel at his own sole cost, for I understand that it will not much exceed 400*l.* There is another circumstance connected with the business, which is likely, I think, to give umbrage to the architectural profession, namely, that Mr. Basevi (one of the Vice-Presidents of the Institute,) acts as architect *under* Prof. Willis, who has given the design for the structure; nor is this matter of doubtful report, it being thus recorded on the foundation stone:—

"Professor Willis, F.R.S., *delt.*
Geo. Basevi, jun. Esq. *archt.*"

Whether Mr. Basevi will be censured by his brother architects for accepting the office of Clerk of the Works to the Professor, remains to be seen. Had it been a matter of mere private arrangement between the parties, I know not that the profession ought to have taken notice of it, but such kind of association seems to portend a change in professional position. To be sure Prof. Willis has a name and fame, and is a scholar; but then we find Prof. Hosking engaged at St. Mary Redcliff as *aide* or *sub* to Mr. Britton! At present such co-partnerships may be matters of arrangement and choice, but these strange examples may not be lost on the public, and the time may arrive when they will be insisted upon. Nor is it the least remarkable thing, that in both the cases above-mentioned the non-professional man formally takes precedence of the professional."

Had every great medieval painter had as many hands as Briareus, and a pencil in each, he could not have painted half the old pictures daily discovered and affiliated upon him. One would think the dust of lumber-rooms bred these productions like vermin, and that it was only requisite to poke into some receptacle for rubbish, to be sure of turning up a jewel! An undoubted 'Virgin,' by Correggio, accidentally met with at the Seven Dials—a 'Belle Jardinière,' the real original by Raffael, just brought to light at Newington Butts—Titian's 'Venus,' of which that in the Grand Duke's collection is a palpable copy, rescued from its obscure and dangerous situation as sign of the Victoria public-house, Clerkenwell—Michaelangelo's 'Cupid pursuing a butterfly,' long the chief ornament of a celebrated Brentford connoisseur's cabinet: such are the mare's eggs hatched dozen after dozen, which the finders imagine those of a phœnix! Here is Annibale Carracci's '*Andromeda*,' till now quite an unknown work by that master, come all the way from Derbyshire to the Cosmorama, Regent Street, for metropolitan admiration. Many critics indeed, foreign as well as native, the prospectus declares, ascribe it "with equal confidence" to Titian, Domenichino, and Guido; so do we, ascribing it with not a whit more confidence to one of them rather than another. Their beauties apart, it cannot boast even their defects, neither Titian's bad draughtsmanship, nor Carracci's coarseness, nor Domenichino's dull elaboration, nor Guido's morbid sentiment, but exhibits all these faults in a worse style of its own; its greatest merits do not rise to the level of their imperfections. Yet we dare say it will make the grand tour of these kingdoms, and be proclaimed at sound of penny trumpet by the newspaper critics wherever it goes—a miracle!—with full as much justice, too, as many another one—some "Old Master" gross and grimy enough to pass for a specimen of the great Italian style, or some modern daub, whose importunate glare and flare is taken for undeniable splendour, overpowering magnificence. Public taste has little improved as yet, despite all our travelled dilettantes, all our visitors of Galleries, Museums and Collections, continental and national: year after year are pictures or sculptures exhibited in this show-room, or that, where the real show is the flock of gulls opposite them. Could the groan, which "escapes from Andromeda's finely formed mouth" (*vide* prospectus) be heard, we surmise it would be a groan for her admirers, not herself: the Sea-monster, a "huge, disgusting reptile, with glowing eyes and opened jaws," seems to utter an immense O! of amazement, which, perhaps, may mean, turned into plain English—"All the fens of Lincolnshire could not furnish greater geese, than stretch out their necks and clap their wings in canorous cackle at my charms and self-congratulation at their perception of them! *Tant mieux*—they will depart well pleased, and well plucked." Verily popular connoisseurship has made no vast advance since the time when President West's 'Christ Rejected' went circuit through both England and North America, gathering golden tributes and leaden opinions from saint, from savage, and from sage, all the way between London Stone and the Blue Mountains. Another of these itinerant exhibitions was a pair of 'Adam and Eve' scenes, by *M. Dubufe*, which combined the bad qualities of both the French and British schools, so united the public voices of France, Great Britain, and Ireland in its favour. Various examples besides crowd upon our memory for quotation; but let these suffice. We have made poor 'Andromeda' an occasion to moralize a little about popular taste, though its proprietor appears no more impressed with a sense of its perfection, than the lady or the Monster. He professes himself only anxious that its just pretensions should be ascertained by the critics, and we have contributed our mite towards promoting this most legitimate object.

The question which Mr. Hawes lately propounded to Sir Robert Peel respecting the public recognition of the labours of eminent civilians (see *Athen.* p. 756), appears, from the subjoined letter, addressed by the Premier to Mr. Eastlake, as Secretary of the Commissioners on the Fine Arts, to be likely to lead to some practical results:—

Whitehall, August 17, 1843.

Dear Sir,—A proposal was recently made in the House of Commons, that the Commissioners should be empowered by Her Majesty to inquire into the best means of doing honour, by public monuments in sculpture or painting, to be erected at the public charge, to the memory of men entitled to the gratitude of their country by eminent civil, literary, or scientific services. I was unwilling to devolve on the Commissioners a general inquiry of this nature, not immediately connected with the original object for which the Commission was appointed, but I willingly undertook to recommend to Her Majesty to give to the Commissioners full authority to consider whether there is any portion of the edifice intended for the accommodation of the Houses of Parliament or of the buildings connected with that edifice, which could, with advantage and propriety be allotted to the reception of monuments, such as those to which I have before adverted, and to report their opinion to Her Majesty, not only with regard to the particular site of such monuments, but in the event of an appropriate site in connexion with the new Houses of Parliament being recommended by the Commissioners, with regard to the principles, generally, which should govern the selection of the names to be honoured by so distinguished a record of national gratitude, and to the best mode of combining the public acknowledgment of eminent service with encouragement to the arts in this country. I am empowered by Her Majesty to recommend the subject to the consideration of the Commissioners, and to give them Her Majesty's full authority for entering upon it.

I am, &c. (Signed)

C. L. Eastlake, Esq. Robert Peel.

A correspondent of *The Times*, writing from Canada, questions the policy of extending the law of copyright to the colonies. The price (he says) of books printed in Great Britain and carried to the colonies is so high, that it amounts to a prohibition; and this is not only a serious impediment in the way of civilization, but debars the colonists from procuring even those works which would be of immediate practical utility to him; and so well (he tells us) are the English booksellers aware of this, that they seldom or ever send out more than half a dozen copies of a new work. Why, what is there in this argument that does not apply equally well to Connaught, or Munster, or Fife, or Forfarshire? No doubt the high price of books is an impediment in the way of civilization, and the remedy is to remove the tax on paper, &c. &c., and all other taxes that tend to raise the price. Books would help forward civilization in England, Ireland, and Scotland, as well as in Canada: they have a "direct practical utility" in Wales as well as in Ottawa County or Trois Rivières; and are the Welsh farmers or the Irish cotters better able to pay for them than the Canadians? The argument, therefore, so far as it is general, is of universal application, and so far as it is special, is without force. The booksellers of Great Britain, we are told, send but half a dozen copies. Why? because if heretofore those copies did not reach Canada by express, the market was forestalled by the American reprints; but we will answer for it, that if an enterprising Canadian bookseller will enter into a treaty with the London publishers, he may have five hundred or five thousand copies of any work expressly printed for his market, at some twenty or five and twenty per cent. above the mere cost of paper and press-work; and he may thus help forward colonial civilization, and put works of practical utility within the reach of the colonist, at a price at which it is impossible to offer them to our own countrymen. This is the natural and obvious remedy of the inconvenience of which the writer complains, and will certainly be adopted; but no doubt the market has not yet adapted itself to the altered circumstances, and books are and must be dear, until the new channel is freely opened.—Already, and since the above was in type, we have received from Mr. Murray, the announcement of a series, to be called "The Colonial Library," expressly projected to meet the difficulties urged by the Canadian, and in which it is proposed to furnish the colonists with useful and popular works at the lowest possible price.

Private letters from Jiddah, on the Red Sea, mention that an Englishman, Mr. Mansfield Parkyns, late of Trinity College, Cambridge, is making preparations to ascend the White Nile, penetrate the Galla country, and strike across the continent to the Niger! Our correspondent says, Mr. Parkyns is a high-spirited young man, and has been some time travelling in Asia Minor.—A letter from Constantinople states, that "The impression is every day gaining ground at this place, that the report of the murder of Colonel Stoddart and Captain Conolly, at Bokhara, is altogether unfounded in fact. All the Hajjis who pass through Constantinople, on their way to Mecca, agree in contradicting this story, and state that, though incarcerated, these gentlemen are still alive." Surely the government must take some active and effective means to set this question at rest.

We learn, from the *Doncaster Chronicle* that the workmen employed in cleaning and repairing the parish church in that town, have discovered upon the walls some highly curious and interesting paintings in fresco [?], which had become almost obliterated by dirt and the hand of time. The design is, it is said, extremely rude, and the figures are drawn in a hard and Gothic style; are about four feet in height, and each distinctly defined by a broad black outline. Such, in fact, is the general character of the painting, that there would seem to be little doubt that it is of a remote date; if, indeed, it is not coeval with the church itself. The date of the erection is not accurately known, but it is conjectured to have been in the reign of Edward IV., about the close of the fifteenth century. Mr. Alport, artist, of Rotherham, is engaged in making a drawing of the picture above described, with a view to the publication of a lithographic plate.

VENICE.—MORNING and EVENING EXHIBITION.—Under the patronage of the Emperor and Empress of Austria, the Kings and Queens of Prussia, Bavaria, and Holland (whose signatures may be seen in the Royal Album, in the Exhibition Room).—The Grand MODEL of the CITY of VENICE (with brilliant effect of sunshine, produced by artificial light), representing every object in the City.—Open to the public, at the Egyptian Hall, Piccadilly, from eleven in the Morning till Ten in the Evening.—Admission, 1*s.*

DIORAMA, REGENT'S PARK.

NOW OPEN, with a NEW EXHIBITION, representing the CATHEDRAL of NOTRE DAME at Paris, with effects of Sunset and Moonlight, painted by M. RENOUX, and the BASILICA of ST. PAUL, near Rome, before and after its destruction by Fire, painted by M. BOUTON. Open from Ten till Six.—N.B. A GRAND MACHINE ORGAN has been constructed expressly for this Exhibition, by Messrs. Gray and Davison, of the New-road, and will perform the Gloria, from Haydn's Service, No. 1, during the midnight effect of the Cathedral of Notre Dame.

MEETINGS FOR THE ENSUING WEEK.

TUES. Horticultural Society, 3, P.M.
THUR. Zoological Society, 3.—General Business.

MUSIC AND THE DRAMA

HAYMARKET.—'The Wedding Breakfast' is only noticeable as a specimen of that sort of mechanical drollery which is the staple of pantomimic fun, and exerts such triste influence over the gambols of the motley crew. It is a farce, made up of practical jokes, of the most approved kind on the stage, we conclude, because they are constantly employed to produce bustle, in the absence of anything lively or natural in the dialogue or the characters; but which reduce the actors to the condition of grimacing machines. Of humour, it has not a particle; and the incidents are not merely absurd in their improbability, but disagreeable withal. Mr. Farren plays an elderly Doctor, who is horrified at the expense of the "wedding breakfast," which the "managing mamma" of his young bride-elect is ordering at his cost; and whose discomfiture is complete at hearing from the lips of the young lady herself that she hates him and loves a man whom she has corresponded with, but never seen, having only had a squeeze of his hand "in the dark, in Kensington Gardens." Of course, the lover enters the next minute, and turns out to be an adventurer, who is going to marry a rich widow, whom he hates, to save himself from jail; but, instead of the young couple running off together, as usual, the respective parties pair off; the old Doctor making his young bride believe that he was her unseen admirer, and exposing the baseness of his rival, whom he had unwittingly introduced to his intended wife. To us, there is no more of drollery than of novelty in all this; though one or two of the situations are ludicrous, apart from their outrageous improbability; but this kind of humourless fun, which is made at the expense of the *dramatis personæ*, and also of the performers who fill the parts, is of an unpleasant kind,—and, like a practical joke in real life, is only perpetrated or enjoyed by such as are incapable of any more genial amusement. It was painful to see such an actor as Mr. Farren lending himself to be the laughing-stock of a piece which afforded scope only for those grimaces that he practises too constantly. The end of a farce, it may be said, is accomplished if it makes people laugh: this the author and actor managed between them, though the merriment was neither universal nor cordial.

MISCELLANEA

Paris Academy of Sciences.—Aug. 14.—The notes read or reported upon were chiefly on matters of abstruse science, possessing a very limited interest. —A paper was received from M. Dutrochet, on the production and ripening of fruits. This gentleman confirms, by his experiments, the modern opinion that the removal of the leaves of fruit-trees, in order to expose the fruit to the direct influence of the air and light, is exceedingly destructive; but he considers it highly essential that the tree itself should be well exposed to both. This is particularly requisite with the dwarf vine, which if shaded, or placed in a position which prevents its receiving an abundant supply of air, becomes almost unproductive.—The same gentleman communicated a paper on some enormous hailstones picked up on the 10th inst., near Villers-Cotterets. They were from one to two inches in diameter generally, but some were as large as a hen's egg. Their form was an irregular half-sphere. In the centre was a nucleus of opaque ice, over which was a covering of transparent ice, and this was repeated four times, the covering of each opaque body always transparent.—A paper on lightning, and its action on sand, was communicated by Dr. Fiedler. It is a general opinion at Paderborn, in Westphalia, that wherever a thunderbolt falls vitrified tubes are to be found. In 1711, the Rev. Mr. Hermann, at Massel, Silesia, followed these tubes to a considerable depth in sandy hillocks, the description of which is to be found in his 'Mastography,' under the denomination of fossil shrubs or osteocolla. He thought that these tubes were formed in the earth, and came gradually up to the surface. Other persons have considered them to be petrified roots. M. Couerden dug one up at the depth of 15 feet. In 1812, Mr. Irton, of Irton Hall, dug one up. Dr. Fiedler has seen them in Hungary, and at Harz, near Dresden. They have been found on the border of the desert of Sahara, in the Brazils, &c. M. A. de Humboldt sent to Dr. Fiedler a piece of porphyry which he broke from off one of the highest mountains of the chain of the Andes, and which contained a portion of a tube. On the 13th June, 1841, at 5 p.m., during a violent thunder-storm, a bolt fell on the right bank of the Elbe, near the village of Loschwitz, a league from Dresden, split a stake, burnt the leaves of a plum-tree, and buried itself in the earth at an angle of 66°. On digging a hollow tube was found, in which the sand was completely vitrified; it was simple for about four feet, and then divided itself into two branches, which disappeared on reaching a sandy, argillaceous, and ferruginous soil, containing a great deal of water. The electric fluid, on meeting several roots, went round them, simply blackening without destroying them. —*Aug.* 21.—The following communication from the Governor of Guadaloupe was laid before the Academy: The earth has not ceased to quake, particularly at Grande Terre and Point-à-Pitre, since the 8th of February; but since the 24th of April the shocks, with the exception of a pretty sharp one on the 4th of May, have become more slight as well as more rare, and we were beginning to think we were at the end of the phenomenon, when on the morning of May 4, an alarm was excited by new convulsions of the earth. The first shock took place at about half-past five; it was severe, and lasted from 3 to 4 seconds. At about six o'clock a second shock took place, which lasted 8 to 9 seconds. According to the general opinion, it was the most severe that we have had since the catastrophe of February 8. I compare it with the shocks tha we felt at Basse-Terre on that fatal day, and I find that my furniture here has been as much tossed about as it was in my cabinet at the moment when the district of the Champ d'Arbaud was the most violently agitated. I know nothing yet from Basse-Terre or the country, but here in the midst of our ruins, we saw a great number of the fragments of our walls fall, and our population in affright, rushing to the public squares, in apprehension of a new disaster.—A paper was received from M. Delaunay, announcing his intention of making a series of minute investigations connected with the tides. He states that it was, in the first instance, necessary to determine whether the tides of the Atlantic are produced in a direct manner by the action of the moon and sun, or whether, as asserted recently in England, they proceed from the motion of the waters of the South Seas. M. Delaunay states, as the result of his investigations, that the tides of the Atlantic are to be attributed to the action of the sun and moon.—M. Flourens read a paper on the comparative structure of the skin in various portions of the human race. In the year 1836, M. Flourens published the results of his first investigations as to the comparative structure of the skin in three distinct races, the white, black, and red, or American. Since then he has received from Algiers portions of skin, skulls, and entire heads of Arabs, Moors, Negroes, &c., and he reports that they are all essentially and fundamentally the same.

Progress of Lotteries.—Excursion.—A model of a Ship, &c., will be disposed of by Lottery on board, among the purchasers of Tickets for the Excursion. Tickets, with a share in the Lottery, 3*s.* 6*d.*

Four magnificent and richly wrought silver tea services, with coffee pots, now exhibiting at the —— Rooms, Corn Exchange, Cork, will be raffled for the two following days after the exhibition, Friday the 25th, and Saturday the 26th, of August, &c.

The following curious epitaph may be seen in the churchyard at Folkestone:—

In memory of Rebecca Rogers,
who died August, 22, 1688, aged 44 years.
A house she hath, it's made of such good fashion,
The tenant ne'er shall pay for reparation;
Nor will her landlord ever raise her rent,
Or turn her out for non-payment:
From chimney-money, too, this cell is free,
To such a house who would not tenant be?

THIRTEENTH MEETING OF THE BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

[*From our own Correspondents.*]

FRIDAY, AUGUST 18.

SECTION A.—MATHEMATICAL AND PHYSICAL SCIENCE.

Mr. S. HARRIS laid before the Physical Section the results of the discussion of the Meteorological Observations made at Plymouth and Devonport at the request of the Association. The great mass of the results which these observations necessarily involved, had precluded the possibility of completing a full report, such as would be requisite for the pages of the next volume of the Association. The requisite documents are, however, sufficiently complete to insure this report for the next meeting. The first series of observations were those deduced from Mr. Whewell's Anemometer, by which a result has been arrived at not dissimilar from that laid before the meeting at Manchester, viz. the existence of a sort of trade-wind, or current of air, from south to north, in the place where these observations were made. This was exemplified by large typographical delineations of the aerial currents, by lines proportional to the velocity and direction for given times, laid down for the years 1841 and 1842. Mr. Harris made some observations on the nature and capabilities of this instrument, and the results which might be expected from it, in deducing the great annual movement of the atmosphere. The result of the discussion of the observations with Osler's Anemometer were next brought under consideration, which being regularly tabulated and discussed, had shown a mean hourly intensity of the wind, tending to follow an order similar, but inverse, to that of the barometer; a major and minor wave occurring in the day, so as to produce two maxima and two minima of intensity, the full discussion of these observations had not yet been effected to a sufficient extent to exhibit all the various relations of the wind required. The remaining observations on pressure and temperature were next considered; and graphical delineations of the mean hourly progress of the temperature, pressure, dew-point, and intensity of the wind, were brought under one point of view in a general diagram.

The Rev. Dr. SCORESBY inquired from Mr. Harris how the mean lines, which appeared to be the final result of the observations with the anemometers, were obtained?—Mr. Harris replied, that these were merely laid down by the eye, that no deduction was grounded upon them, and that they were placed there merely to give the Section a general idea of the mean direction of the great aerial current which passed annually over Plymouth.—Dr. Scoresby suggested, that a mean result might, as he conceived, be very readily and accurately obtained, by laying down each day's work of the machine, something after the manner in which traverse sailing was worked by the masters of ships at sea. To this Mr. Harris assented. Dr. Scoresby stated, that so invariable were the relations existing between the temperature, pressure, the direction of the wind, and the general state of the weather in the Polar Seas, that when he sailed in them he found he could almost with unerring certainty, predict the changes of wind, from north to south and *vice versâ*. He had kept a record of these anticipations for thirty-two days, and twenty-nine of those turned out to be correct.—Mr. BEAMISH said, that the general result of the anemometer, obtained by Mr. Harris at Plymouth, seemed to indicate an atmospheric current tending towards the west; now this was opposed to a most familiar fact in the county of Cork, namely, that all the trees, particularly near the coast, had a leaning towards the east; indeed, it was well known that the prevailing winds here were westerly.—Mr. Harris replied, that the long continuance of a particular wind did not at all prove that the total atmospheric current set from that quarter; for a single day's violent blowing of a storm from the opposite quarter might be more than sufficient to counterbalance the long continued, but more gentle effect.

Prof. LLOYD availed himself of the opportunity afforded by the present discussion, to read an extract of a letter which he had that morning received from Mr. Osler, describing various improvements which he had recently made in the construction of his anemometer. These improvements consisted, chiefly, in a modification in the form of the vane, whereby its arc of oscillation was reduced in magnitude, and in the dimensions of the pressure plate, by which its indications were rendered more sensible. The writer stated, that he felt much confidence in the performance of his instrument in its present improved form.

'On the Nature and Causes of the Diurnal Oscillations of the Barometer,' by G. Hutchison.—In the first part of this paper the author, after stating the leading features of the phenomenon, argued, that the three explanatory suggestions previously advanced relative to its cause, viz. diurnal variations of temperature, diurnal variations in the amount of moisture in the atmosphere, and diurnal variations in the force of the wind, whatever influence they might separately and conjointly have in modifying the extent of the atmospheric tides and the periods when their maxima and minima are attained, were totally inadequate to account for the broad features of the phenomenon, as exhibited in intertropical climates. The author then ascribed the phenomenon of diurnal atmospheric tides to the ever-varying degrees in which the rotatory and orbital movements act, either in union with, or in opposition to, each other in different latitudes during the course of twenty-four hours, and the different seasons of the year. During night, when the orbital and rotatory movements co-operate more or less in direction, the excess of acquired velocity, through space in the orbital direction above the mean of 68,000 miles an hour, must communicate some degree of lateral pressure to the atmosphere in the direction of rotation. On the contrary, during day, when the orbital and rotatory movements act more or less in opposition to each other, the atmosphere must be subject to an equal amount of lateral pressure in the opposite direction of rotation. But when the atmosphere was moving in the orbital direction, with its mean velocity of 68,000 miles an hour, which occurred only at 6 o'clock A.M. and P.M., no lateral pressure could thence result, for the rotatory and orbital movements of the atmosphere, through space, were then equal to, and therefore nullified, or neutralized, its acquired velocity. The theory advanced is also supported by the results obtained from laborious reductions of long-continued observations made in different places, in temperate latitudes, by different philosophers. From these it appears, that even in temperate latitudes the atmospheric tides attain two maxima and two minima annually, the former occurring during spring and autumn, the latter during summer and winter. This, on the supposition of the theory being true, is exactly what ought to take place. In consequence of the rotatory and orbital movements coinciding more directly during night, and being more directly opposed to each other during day, at the equinoxes than at other seasons, it is in accordance with the theory under consideration, that the atmospheric tides should attain their maxima about these periods of the year; and upon the same principle, in consequence of the greater divergence of these forces from exact co-operation with, or opposition to, each other at the summer and winter solstices, than at other seasons, it is also in accordance with our theory, that the atmospheric tides should attain their maxima about these periods of the year.

Mr. HARRIS inquired, whether the theory laid down by Mr. Hutchison would explain the atmospheric tides in the upper regions of the atmosphere, which were well known to be directly opposite to those lower down, as, for example, those observed and recorded at the Great St. Bernard by Mr. Forbes.—Mr. HUTCHISON answered, that they were explained by the theory he had advanced, and that the facts observed by Mr. Forbes at the Great St. Bernard were among those which he had quoted as proofs of the soundness of the explanation he had ventured to give.—Mr. Harris did not see how the fact, that the hourly oscillations of the barometer, observed at lower latitudes, become negative at higher latitudes, could by any possibility be accounted for by Mr. Hutchison's theory.—Mr. Hutchison admitted, that he could not account for them, and that they constituted the only real difficulty he had met with in explaining by his theory the observed facts.

Mr. NOTT, 'On a new Electrical Machine, and upon the Electricity of the Atmosphere.'—This paper treated at great length of electrical currents and of the atmospheric electricity, by way of a preliminary to the consideration of terrestrial magnetism. The author insisted on the close analogy between the voltaic pile and a magnet. The difference between voltaic and frictional electricity he conceives to be, that the former is *in* the conducting wire, the latter *on* its surface, and therefore decomposed by whatever approaches it. Besides, the voltaic pile exhibits the two electricities and the current in which they unite; whereas the ordinary frictional machines develope and maintain but one electricity and no current. Among the novelties presented by the paper, may be mentioned the description of what the author calls the rheo-electric machine, in which both electricities are developed by friction. "It consists of a circular plate of glass and another of resin, both supported upon a horizontal axis, and set in motion by a winch handle; the rubber of the vitreous plate is connected by a metal rod with the rubber of the resinous one; and the conductor of the latter plate is also connected by a metal rod with that of the former, and thus a complete circuit is formed, as in the voltaic pile. The distribution of the electricity of this instrument is also analogous to that of the pile. For example, the electro-motive disturbance is produced by the plates; the rubber of the vitreous plate is rendered negative, that of the resinous one positive; and the conductors are also in opposite electric states, and their remote extremities are therefore analogous to the poles of the pile. When the conductors are connected by a conjunctive wire, it is natural to suppose that the accumulated electricities flow along its surface in opposite directions, for then an electric current is formed, which permanently deflects the magnetic needle, and the deflection is according to the direction of the current. The direction of motion of this current may be varied at pleasure; for instance, in order to fix our ideas, let us suppose the plates of this instrument and the axis of the conductors to be lying in parallel planes, perpendicular to what is called the magnetic meridian, the conjunctive wire connecting the conductors being bent at right angles, a portion of it will then be in the meridian, and the metal rod connecting the rubbers will be parallel to this portion. If now a magnetic needle be suspended above the conjunctive wire, and the resinous plate, which we will suppose to be placed north of the vitreous one, be connected with the earth, then a current of electricity passes from the resinous plate, and consequently flows along the conjunctive wire from north to south; the needle is then permanently deflected towards the west. If the needle be placed beneath the conjunctive wire, the deflexion is towards the east. When the vitreous plate is connected with the earth, the current flows from the vitreous plate, and the deflexions are in the opposite directions." In the course of his experiments with this machine, the author found that all the parts of it which were made of brass became, by electrization, highly magnetic, and retained their magnetism for some time. The character of the magnetism thus produced will be understood by conceiving an orthographical projection of this instrument, to be drawn upon a horizontal plane: it will be a parallelogram, of which the conjunctive wire will form one side, and the rod connecting the rubbers another: then all the brass parts of one half of this parallelogram, cut off by a diagonal line, will attract the north pole, and all of the other half the south pole. But if immediately after electrization, either pole of the needle be forced into contact with any part of the brass conjunctive wire, it will develope an opposite magnetism to its own, and adhere to the wire, as it would to a piece of iron. He also proved that water may be decomposed by the rheo-electric machine, as with the galvanic current. The two electricities, as developed by this machine, appeared to him to be visibly different: the resinous electricity was subject to remarkable changes of colour, according to the state of the atmosphere and the nature of the exciting body. It also struck him that electricity is radiated in a peculiar manner from magnetized bodies. Combining this observation with a hypothesis respecting the electricity of the globe, viz., that the equatorial parts of the earth are in the resinous (in old language, negative) state of electricity, the poles vitreous (positive); while the atmosphere is, in its lower strata, vitreous, and in the upper resinous; the author proceeded to exhibit the phenomena of the aurora borealis by direct experiment. "I procured a globe

Digitized by Google

of steel and magnetized it. It may not be unnecessary to state how this was effected. I suspended the globe upon an axis, and by a multiplying wheel and pulley set it in rapid rotation; while rotating I made the magnetizing bars traverse from the equator of the globe to the poles. I then tested it with a proof needle, and found it to be regularly and perfectly magnetized. The next object was to place this magnetic globe in similar electric circumstances to those which I conceived the earth to be in. Regarding that region of the atmosphere immediately over the torrid zone as the principal seat of atmospheric electricity, I conceived, that if I surrounded the globe with a ring that would bear approximately the same proportion to the globe, as this region of the atmosphere does to the earth, and electrized them oppositely, that the action of the electricity of the ring upon the air immediately enveloping the globe, would place the latter in nearly similar electric circumstances to those of the earth. If, then, the aurora were an electric phenomenon, that is, a discharge of free electricity, taking place from the pole of the earth, rendering the vortex, which I supposed to be immediately over the pole, luminous, from the great rarefaction of the air within it, and passing over our atmosphere to the upper stratum of the equatorial region, that as I could increase the electric intensity of my artificial terrella as I pleased, an analogous effect would be produced. This result followed with the greatest precision, as I shall now describe. I insulated the ring, and connected it with the resinous conductor of the rheo-electric machine. I also insulated the globe, and connected one of its poles with the vitreous conductor, and placed it so that its equator was surrounded by the ring. These bodies being electrized differently, and at a very short distance from one another, one would expect that a discharge would have taken place between them; instead of this, they at once re-acted upon one another, so that the exterior of the ring being resinous, the interior became vitreous; the equator of the globe resinous, and both its poles highly vitreous; and a truly beautiful and luminous discharge took place from the unconnected pole. The state of the atmosphere has a remarkable effect upon the appearance of this discharge. One evening that the atmosphere was very dense, it had the appearance of a ring of light, the upper part of which was very brilliant, and the under part, towards the globe, was comparatively dark, just as we see at the bottom of ignited vapour; and indeed a vapour of some kind seemed to be ascending from the globe; above the ring, all round the axis were foliated diverging flames, one behind the other. When the atmosphere is very dry, it has merely the appearance of a beautiful electric brush. If the globe be moved towards any point of the interior of the ring, a discharge takes place in the line of shortest distance between them, and then there is a partial intermission of the auroral light. This experiment seems to point out the true cause of the aurora borealis."

This paper gave rise to a most animated but desultory conversation, in which the President, Dr. Robinson, Dr. Scoresby, Dr. Green, and Mr. Snow Harris took part. In the course of this discussion, several questions were asked tending to elucidate the construction and peculiarities of action of the rheo-electrical machine as well as Mr. Nott's views. Mr. HARRIS then stated that he was about to publish, in the *Nautical Magazine*, the observed facts connected with more than 300 thunder-storms, from which he thought it would amply appear that thunder-storms were connected with, and in some manner caused by, opposing and violent currents of wind. That the wind, after blowing for some time from one quarter, changed, and at this crisis, first a calm, and then a flurry and confusion of the wind, blowing from every point of the compass, ushered in the change. It was in this confused state that the rapid deposition of vapour seemed to take place, torrents of water pouring down, and sometimes hail and even large masses of ice, as in the late thunder-storm at Cambridge, by which, as the Dean of Ely had informed him, that immense destruction of property had taken place, the hail breaking even strong plate-glass.

Prof. LLOYD made a short communication, on the method of Graphical Representaion, as applied to Physical Results. It is well known, that if a series of ordinates be taken to denote the observed values of any physical quantities, the corresponding abscissæ denoting the respective values of the variable upon which it depends, the course of the first variable, at intermediate points, may be represented by drawing a curve through the extremities of the ordinates of observation, the exactness of the representation depending on the shortness of the intervals. The observed values of the ordinates, however, being subject to the errors of observation, it is manifest that their extremities are not necessarily points of the representative curve; and the object of the author was to inquire whether, and under what circumstances, *other* points could be substituted for those of immediate *observation*, the former being connected with the latter by known relations. Such a course is usually resorted to, when the intervals of observation are small, and the errors considerable, the curve being, in such cases, drawn (*not through*, but) *among* the points furnished by observation, allowing a weight in proportion to their number. The validity of this process appears to depend on two principles—viz. 1. That the positive and negative errors are equally probable; and 2. the assumption that the function represented is not subject to abrupt changes. It is obvious, however, that its applicability will depend upon the relation in any particular case, which subsists between the intervals of the successive ordinates and their probable errors; and it is important to know what that relation is. The points connected with those of observation by the simplest relations, are those obtained by bisecting the interval between each successive pair, or taking the arithmetical mean both of the ordinates and abscissæ. It is very easy to express, in this case, the relation sought.

Sir W. HAMILTON inquired whether the curve, so corrected by Prof. Lloyd, would not, by a continuation of the process, gradually approach to a straight line, and at length end by becoming one, as the first and last points were alone left unchanged during the process. Prof. Lloyd replied in the negative; as the number of points was not diminished during the process.

Sir W. HAMILTON 'On a Problem in the Calculus of Differences.'—The author here offered a solution of a curious and important problem, which had exhausted the analytical resources of Laplace, who arrived at an equivalent transformation, but by a much less simple analysis.

SATURDAY.

'On the Correction to be applied for Moisture to the Barometric Formula,' by J. Apjohn, M.D.—If the atmosphere were of one uniform temperature throughout, destitute of moisture, and the intensity of gravity were also constant, it is well known that the difference of the altitudes of any two points in the atmosphere would be represented correctly by the formula $D = m \times \log. \frac{p}{p'}$, m being a constant quantity, and p and p' being the respective pressures at the upper and lower stations, as measured by the barometer, or in any other way. The conditions, however, which lead to this simple expression, are in nature never fulfilled; for it will seldom happen that the temperature of either station is 32°, and the atmosphere always includes a greater or less amount of aqueous vapour. A correction for temperature has been long applied, by augmenting the approximate height, or $m \times \log. \frac{p}{p'}$, by the amount that a column of air of this length would expand, if raised from 32° to $\frac{t+\theta}{2}$, t being the temperature of the lower, and θ that of the upper extremity of the aerial column,—by which the expression becomes $D = m \times \log. \frac{p}{p'} \left(1 + \frac{\left(\frac{t+\theta}{2} - 32\right)}{493}\right)$. Such is, I believe, a correct account of the present form of the barometric formula; at least, when we neglect the correction for variation of gravity, which is, however, so minute as to be in general safely negligible. The pressure of moisture in the air must obviously exercise some disturbing effect upon this formula; but though this has been generally admitted by those who have turned their attention to the subject, I am not aware that any attempt at estimating its exact amount has been as yet made; and as the correction for moisture is frequently of considerable magnitude, and may, in my opinion, be applied with as much accuracy as that for temperature, I have taken the liberty of occupying for a few moments the time of the Section with an explanation of the method which it has occurred to me to devise, and with which, from some trials I have made of it, I feel every reason to be satisfied. Let p be the pressure, and t the temperature of the air at the lower station, t'' the dew point of the air, and f'' the force of the included vapour; and let p', θ, θ'' and F'' represent the corresponding quantities at the upper station. This being understood, a little consideration will suffice to show that the presence of the aqueous vapour produces upon the formula a twofold deranging effect. It augments the values of p and p' beyond what they would be in dry air; and it produces an elongation of the column of air between the two stations, additional to that which results from the excess of its mean temperature over 32°, or the freezing point. The first of these is obviated, or, in other words, the correction for it is made, by substituting for p and p' in the approximate formula, $p - f''$ and $p' - F''$, by which it becomes $D = m \times \log. \frac{p - f''}{p' - F''}$. Having thus eliminated the effects of the tension of aqueous vapour upon the pressures, we have next to estimate the conjoint influence of it and temperature in elongating the pillar of air between the two stations. The theory of mixed gases and vapours enables us to do this, provided we can assign proper mean values to the temperature, the pressure, and the force of vapour of the aerial column in question. The mean temperature is usually taken as $\frac{t+\theta}{2}$; and this must be very nearly its true value. For the same reason the mean force of the vapour may be set down as $\frac{f''+F''}{2}$; and let us assume the mean value belonging to the pressure as $\frac{p+p'}{2}$. Now, volume v, of dry air at 32°, under a pressure p, if raised to a temperature t', becomes $v \times \frac{461+t'}{493}$; and if saturated with vapour at this temperature, the tension of such vapour being f'', will become $v \times \frac{461+t'}{493} \times \frac{p}{p-f''}$. This is the volume of the air when raised to t', and saturated at this temperature with vapour. And if this volume of air have its temperature farther raised, we shall say to t, then its bulk will be represented by the expression $v \times \frac{461+t'}{493} \times \frac{p}{p-f''} \times \frac{461+t}{461+t'} = v \times \frac{461+t}{493} \times \frac{p}{p-f''}$ Substituting then in this expression, instead of v, the value of the length of the column of air between the stations supposed dry, and at 32°, viz. $m \times \log. \frac{p-f''}{p'-F''}$ and for p, t, and f'', their proper mean values as already explained, the barometric formula finally becomes

$$D = m \times \log. \frac{p-f''}{p'-F''} \times \frac{461 + \frac{1}{2}(t+\theta)}{493} \times \frac{\frac{1}{2}(p+f''+p'+F'')}{\frac{1}{2}(p+f''+p'+F'') - \frac{1}{2}(f''+F'')}.$$

I may add here, that the correction for moisture is far from being insignificant in its amount, as may be seen by the following example. Let us suppose that, when the approximate height corrected for temperature amounts to 2,700 feet, (a height reached by several of our Irish mountains) the mean value of the pressure to be used in the final factor of the formula, is 27.3, and of the force of vapour, .3 of an inch, then the elongation of the aerial column resulting from moisture, is $\frac{3}{270} = \frac{1}{90}$th of 2,700 = 30 feet. It will, of course, have been observed, that the correction for aqueous vapour differs from that for temperature in the circumstance of being always positive; and this coincides perfectly with the observation I have had frequent occasion of making, viz., that heights calculated by the formula in general use, are all appreciably less than the truth. I may, in conclusion, observe, that in assuming,—with the view of calculating the expansion produced by moisture,—that the pressure to be employed is the arithmetic mean of the corrected pressures got

Digitized by Google

by observation at the two stations, I am quite aware that I am assigning to it but an approximate value. An exact expression for the pressure to be employed admits of being investigated; but its introduction into the formula, while it would give this latter complexity of form, and thus render it less suited for practical use, would conduct to results not appreciably different from those given by the more simple method just explained.

The PRESIDENT briefly pointed out the practical importance of this correction, arising from the extensive use now made of the barometer in geodesical operations, and the uncertainties and discrepancies in its results, which had heretofore been so baffling, but which this correction seemed to afford a prospect of removing.—Prof. LLOYD remarked that Laplace was aware of the necessity of some correction being, in general, requisite to be made in the barometric formula, and had increased the co-efficient from .00375 to .004, which, no doubt, would occasionally give an approach to the correct result; but this correction, so ably brought under the notice of the Section by Dr. Apjohn, was the first attempt at a universally applicable correction.—Dr. APJOHN remarked that Laplace's increase of the co-efficient could only give the result correct in one particular hygrometric state of the air, while in every other it must be erroneous.

Mr. SCOTT RUSSELL then read the concluding Report of a series of observations on the Tides of the Frith of Forth and of the East Coast of Scotland.—These observations extended over several seasons, and no complete report had been hitherto presented, as the observations of each former season had only shown the necessity of further extending the observations. The observations of the first season had proved the existence of certain anomalous tides, which had not formerly been accurately examined, and proved that these anomalies were more extensive than was at first conceived. Next season the observations were more widely extended, so as to comprise the whole phenomenon, including many adjacent places, to which the same anomalies were traced; and thus the general nature and extent of the phenomena were determined with accuracy and precision, and reported to the last Meeting. But it was found that great differences of opinion existed with reference to the cause of these ascertained phenomena, and rendered it obvious that the observations required to be extended still further, in time and extent, in order to settle conclusively the questions which had arisen out of the former inquiries. But this last series, from their extent and completeness, had now been so fully examined and discussed, as to afford ample means of deciding on the nature of the phenomena, and determining their origin. Simultaneous observations had been made at nearly twenty stations on the east of Scotland, from Newcastle and Shields to Inverness, and as many as 2,000 observations a-day registered and discussed. The results of these were exhibited in the tables and diagrams accompanying the Report: and the result of the whole had been to elucidate, in a remarkable manner, the mechanism which propagates along our shores and rivers the great ocean-wave, which carries from one place to another the successive phenomena of the tides—in such a manner as could not have been attained by any system of observation less extensive than that which had been adopted. It is pretty generally known that the phenomena of the tides with reference to their generating cause, the influence of the mass of the sun and of the moon in the various relations of distance and direction of these luminaries, have recently been examined with great success, in a series of researches carried on, first by Mr. Lubbock and then by Mr. Whewell, partly with the co-operation of this society. By means of their labours we are now enabled to predict, with unlooked for accuracy, the time of high water, and the height of the tide in many of the harbours of Great Britain. But many of the local phenomena of tides remained unaccounted for, and these had been the object of a special series of researches, of which the present formed a part; the object being to determine in what way the conformation of the shores, and of the bottom of the sea, and the forms of the channels of rivers and friths, affect the phenomena of the tidal wave. The rivers Dee and Clyde had been formerly examined with this view. To these were now added the Forth, the Tay, and the Tyne, and the northern shores of the German Ocean. The manner in which these observations were conducted, is not the usual one, of noting down simply the hour at which high water occurs, and then the hour of low water, along with the height at which the water stands at these times. Such a method had been found quite inadequate to the purposes for which such observations are required, and, indeed, he thought it of importance that all tide observations should, if possible, be made in the manner he was now about to describe, especially all tide observations made for scientific purposes. This plan was, to carry on simultaneously at the places examined, a series of continuous observations, every five minutes night and day, by successive observers, without intermission, for the period of a month, or of several months, as might be required. Printed forms were sent to all the stations, and in them, the observers simply noted down every five minutes, the height of the tide on a graduated scale placed before him. Every day at noon all these papers were sent by post to the central station, and immediately on their arrival, the papers of the different stations were compared, and their observations laid down on paper, so as to give a graphical representation to the eye of all the observations, by means of which, they were at once verified and compared with great facility. From the examination of these tide-waves thus laid down, certain characters of the tide-wave peculiar to each locality had been discovered. As in the former observations of the Clyde and the Dee, it had been found in this series, that the form and dimensions of a channel produce important changes in the form of the tide-wave. Where the sea was deep and the shore open and abrupt, the form of the tide-wave was symmetrical, and of the form predicted by Laplace, where he says, that in rising and falling, the water covers in equal times equal arcs of a vertical circle. This is the form of the ocean tide-wave; but, on approaching a shallow shore, and travelling along a shelving coast, the tide-wave undergoes two changes—its summit becomes displaced forwards in time, its horizontal chords become dislocated, and the wave ceases to be symmetrical. This peculiar dislocation and displacement are characteristic of a littoral tide, and in the case of running streams, the currents still further affect the tide-wave, and give to it a peculiar distortion characteristic of fluvial tides. To these were further added the exaggeration and elevation of the tide, by means of narrow channels. All these phenomena were fully proved by the present series of observations. The author of this paper also considers it to have been fully established by the observations on the Frith of Forth, that there exists on the eastern coast, satisfactory evidence of the presence of a second tide-wave in that part of the German Ocean, and that the southern tide-wave, a day older than the northern tide-wave, sensibly affects the phenomena of that part of the coast. To this he attributes the double tides of the Frith of Forth, the nature of which he fully explained. Regarding these double tides, various theories had been formed—and there were various ways in which such tides might happen, whenever tide-waves arrive by different paths in different times. But this kind of double tide was, in this case, only to be explained by the method he had adopted, and which removed the difficulties in which the subject had formerly been involved. He then proceeded to explain the mode of discussion which had been adopted. It was the semi-diurnal inequality, so accurately examined by Mr. Whewell, which enabled us to decide on the ages of two tides. If the two tides which appeared together, presented opposite inequalities both in time and in height, regularly alternating, varying with the moon's declination, disappearing with it, and re-appearing with it, and following it regularly, without regard to other simultaneous changes of a different period, then it became plain that no other inference could be drawn, than that which he had mentioned; when, further, he had proceeded to treat these tides as compounded of two successive tides, one due to a transit $12^h\ 24^m$ later than the other, and had used for this purpose two simple river tides super-imposed at a distance in time corresponding to that at which the northern and southern tides could enter the Frith, he had obtained a close representation of the double tides of the Frith of Forth; when these two methods of examination ended in the same conclusion, he conceived that it had obtained a very high degree of probability. By means of these observations tide-tables had been formed, which were designed to afford a more accurate means of predicting the local tides of the east coast of Scotland than any we now possessed.

Dr. ROBINSON and the PRESIDENT put several questions to Mr. Russell, for the purpose of eliciting the facts more clearly.—LORD MOUNTCASHEL inquired whether Mr. Russell had observed and accounted for any of the tidal phenomena which were denominated bores, and described one which he had witnessed in the River Seine, the rapidity of which far outstripped that of the steam-boat in which they were proceeding.—Mr. Russell said that he had frequently observed this phenomenon, and described the bore of the River Dee, and of the Solway Frith. He then briefly accounted for it on the principle of the tidal wave coming with enormous rapidity from deep water, where it was freely propagated into shoal water, where the upper part, retaining its velocity less impaired while the bottom was retarded, it toppled over, at length, breaking in its rapid onward course.—Captain LARCOM observed that the Ordnance Survey would contain a very full account of the tidal phenomena along the coast of Ireland. Captain Larcom hoped before long to lay before the Association the result of the observations made on the coast of Ireland in the course of the Ordnance Survey. Gauges were established at different stations, and observations have been made every five minutes during the course of three lunations. The direct object of them was to obtain data for the plane of mean sea level; but while the observations (which are now in course of reduction) are likely to decide this, they also give much valuable information as to irregularities like that just mentioned. He might mention that in Lough Swilly the spring tide high water was eight feet higher than in Lough Foyle.

'Experiments to prove that all Bodies are in some degree Inelastic, and a Proposed Law for estimating the Deficiency,' by E. Hodgkinson, F.R.S.—Mr. Hodgkinson said it was a principle generally acknowledged in the present day, and employed by those who have written on the subject of elasticity, that, when bodies are acted upon by forces tending to elongate or compress them in a small degree, the changes produced are in proportion to those forces; and that equal extensions and compressions are produced by equal forces. That this principle is true, so long as the change produced in bodies is very small, is not be doubted; and as regards *extensions* it is the basis of the early investigations of Jacques Bernouilli on the elastic curve; of Hooke who was its author (Theory of Springs, Phil. Trans., 1666,); Mariotte, Leibnitz (De Resistentia Solidorum, 1684). With respect to elasticity, it was adopted in the profound inquiries of Euler on the strength of columns, which were corroborated by Lagrange (Berlin Memoirs); and with respect both to *extensions* and *compressions*, it forms the basis of the calculations on the strength and elasticity of bodies in the principal theoretical and practical works on mechanics of the present day; as the Mécanique of Poisson, and the works of Whewell, &c.—the practical treatises of Navier, Poncelet, Tredgold, Barlow, Moseley, &c. He hoped, however, to convince the Section that this principle does not operate *alone* in the resistance of bodies subjected to tension, or to compression, or to both. He hoped, too, to show the law which the element, not considered by writers, nor generally known to exist, is subject to. This element is a defect of elasticity, or a set, to which all bodies made to undergo a change of form, however small, seem to be liable. The defect here mentioned was known to exist only when the body had been strained with a considerable force, or such as to be equal to one-third, or upwards, of the breaking weight. But the experiments which he should adduce would show that the defect commences with the smallest changes of form, and is increased according to the square of the extension, or compression, or of the weight. Thus, if e represent the extension or compression which the strained body had undergone, and $a\ e$ the force which would have produced that extension or compression if the body had been perfectly elastic, the real force necessary to produce this change, e, will be less than the former by a quantity, $b\ e^2$, representing the defect of elasticity. Hence the force required to produce a change, e, is $a\ e - b\ e^2$, where a and b are constant quantities. He had found this law to obtain when the change produced in the body arose from extension or com-

Digitized by Google

pression alone, but when the change arose both from extension and compression, as in the flexure of a rectangular body, the force of a fibre was to that due to perfect elasticity, as $a\,x - b\,x^2$ to $a\,x$; or it was equal to $a\,x - b\,x^2$, where x was the weight applied, and a b constant quantities, as before. In proof of these statements, Mr. Hodgkinson mentioned that having remarked, in his experiments made for the British Association on the subject of hot and cold blast iron, that the elasticity of bars broken transversely was injured much earlier than was generally assumed, he paid particular attention to this circumstance in his future experiments, and had bars so formed that he could separate the elasticity of extension from that of compression; by these bars, which were very long and of small depth, he perceived that one-fiftieth or one-eightieth of the breaking weight was sufficient to injure the elasticity. He mentioned the matter to his friend, Mr. Fairbairn (who was associated with him in the inquiry), soon after he had made the discovery; and Mr. Fairbairn's subsequent experiments made to determine the strength of rectangular bars of iron, from all parts of the kingdom, were conducted in the same manner as Mr. Hodgkinson's had been; the deflexion and quantity of set, or defect of elasticity, from each weight being always observed. Mr. Fairbairn's experiments were on bars cast one inch square and five feet long, and were made with the utmost care; Mr. Hodgkinson has, therefore, adopted their results with respect to the "set," and taking means both from Mr. Fairbairn's results and his own on the same sort of bars, he has sought for the relation between the weights and the mean sets from those weights, these sets being the deflexions or deviations from the original form of the bar, after the weights have been removed. To ascertain the relation above, Mr. Hodgkinson had curves described from the results of the experiments, making the sets the abscissæ, and the weights the ordinates; and the similarity in appearance of these curves to the common parabola, led him carefully to examine whether they were not in reality represented by that curve. The examination was successful—the parabola was the curve; and the mean results of the observed sets, together with the calculated ones, from equal additions of weight, from 56 to 448 lb., derived from 44 kinds of cast iron, and from 90 to 100 experiments, were as follows,—

Weights	56	112	168	224	280	336	392	448
Mean sets	.003	.013	.026	.047	.069	.102	.136	.197
Computed sets (parabolic)	.003	.012	.027	.047	.072	.102	.138	.181

Mr. Hodgkinson made experiments on stone, timber and wrought iron, and observed the quantity of set in all. These different materials, when the results from them were constructed, all gave the form of the parabola, though less perfectly than in cast iron, as the experiments on them were but few. It appears, from the above-stated experiments, and others that were made, that the sets produced in bodies, are as the squares of the weights applied. Hence, there is no weight, however small, that will not produce a set and permanent change in a body; all bodies, when bent, have the arrangement of their particles altered to the centre; and when bodies, as the axles of railway carriages, are alternately bent, first one way and then the opposite, at every revolution, we may expect that a total change in the arrangement of their particles will ensue. It appears, too, from the results of these experiments, that all calculations hitherto made, on the strength and elasticity of bodies, have been only approximations. Mr. Hodgkinson stated, that he laid the results of this communication before a meeting of the Literary and Philosophical Society of Manchester a short time ago, soon after he had made the discovery which it contains. In the prosecution of the experiments he had received every assistance which the works of his friend, Mr. Fairbairn, could supply; and Mr. Robert Rawson had kindly assisted him in the reduction and arrangement of the results of the experiments.

This communication gave rise to much conversation, in which the President, Prof. Lloyd, Dr. Robinson, and other persons joined, and in which all agreed, that these experimental inquiries were of the utmost importance in supplying a solid foundation for the speculations of the mathematical investigator in this most difficult branch of physical inquiry. Dr. Robinson also inquired, if Mr. Hodgkinson had observed whether the molecular structure of the bodies, on which he had experimented, was altered in any manner, and if so, how did the change take place, during the progress of the experiments?—Mr. Hodgkinson replied, that he had no means of determining this point satisfactorily, but he had no doubt, that matter, when subjected to strain, long before it broke, had its molecular structure permanently deranged. He exemplified this by the axles of locomotive engines, which, as they turned round, had the parts that were extended and compressed successively underneath and above; and after this action had been continued for a long period, they were found to become of a kind of crystalline structure, internally, and of course were much impaired in strength.—Prof. Stevelly said, that the forces to which they were subjected were in kind, though not in degree, something like the alternate bending back and forward of a piece of wire, under which it at length broke.—Mr. Hodgkinson assented.

Dr. Robinson made the following report to the Section on the progress of the Committee appointed for making experiments with Captive Balloons.

"The requisite apparatus is nearly complete. The balloon, eighteen feet diameter, and twenty-five feet high, has been received at Woolwich by Colonel Sabine. Mr. Wheatstone's Electric Thermometer has been tried, and found to act in the most perfect manner at distances of some miles, and I have ordered the addition of another part for giving the hygrometric indications. A series of experiments has been made on the strength and weight of cordage of various kinds of fibre; the proper quality has been decided on, and I am happy to state, that Mr. Enderby, who has taken great interest in these inquiries, will present the necessary quantity of it to the Association. Unless some unforeseen occurrence interfere, I hope we may be able to have a series of observations for the twenty-four hours on the 21st of September next. Of the original grant of 250*l.*, 81*l.* 8*s.* has been expended. The Directors of the Woolwich Gas-Works have shown every wish to accommodate us, and assisted us in our preliminary experiments, so as to make the inflation of the balloon perfectly manageable. To complete the advantages of our position at Woolwich, I would suggest it as extremely desirable, that a request be made by the Association to the Master-General of the Ordnance, entreating his assistance."

The following paper from Prof. Wheatsone, which ought to have accompanied the preceding Report, was not received by Dr. Robinson till near the close of the meeting.

The telegraph thermometer which is intended to be carried up by the balloon, weighs, with its case, about four pounds. It is thus constructed; the movement of a small clock causes a vertical rack to ascend and descend regularly in six minutes, three minutes being occupied in the ascent and three in the descent. The rack carries a fine platina wire, which moves within the tube of a thermometer; the extent of motion of this wire corresponds with 28° of the thermometric scale, but it is capable of adjustment, so that it may pass over any 28° of the range. Two very fine copper wires, covered with silk, and of sufficient length to reach from the ground to the balloon, when at its greatest elevation, are connected with the instrument in the following manner: the extremity of one wire is connected with the mercury in the bulb of the thermometer, and that of the other wire with the frame of the clock, which is in metallic continuity with the platina wire. On the ground, the lower extremities are joined together; in the wire whose opposite end is connected with the mercury in the thermometer, a sensible galvanometer is interposed, and in the course of the other wire a single, very small, voltaic element is introduced. The galvanometer having been properly adjusted to its zero point, it will remain so during the time that the platina wire is not in contact with the mercury in the tube, but the needle will deviate so soon as the contact takes place, and will remain deflected until contact is again broken during the ascent of the rack. During each half second of time, corresponding with the beats of the clock, the wire moves through the 360th part of its range, and a different point of the range consequently corresponds with a different beat, or half second of each alternate three minutes. If, therefore, an observer below be furnished with a chronometer, timed to coincide with the clock in the balloon above, and note at what instant the needle of the galvanometer is deflected, he may infer from that observation the temperature indicated by the thermometer in the balloon; for, according to the different expansion of the mercury in the thermometer, the contact is broken at a different half-second. Should the rates of the two time-pieces not exactly correspond at the conclusion of a series of observations, the results will not be vitiated, as a correction may be easily made. It is intended to add to this apparatus a wet-bulb thermometer; this will involve only the addition of another platina wire to the rack, and of another insulated wire, reaching from the balloon to the earth, with its interposed galvanometer.

For other meteorological instruments, the indications of which are to be transmitted to a distance, I occasionally employ the agency of electro-magnetism to ring a bell, to mark with a type, or pencil, &c.; but for the purpose in question, such methods cannot be so conveniently employed as the deflexion of the needle of a galvanometer, on account of the necessity of having the long conducting wire extremely fine, in order to avoid adding too much to the weight of the balloon. If the electromotive force of the rheomotor were increased, which it would be necessary to do were stronger currents required, sparks would occur at the surface of contact of the mercury, which would produce injurious effects.

Major Beamish asked, to what height Dr. Robinson supposed these balloons would allow the observations to extend.—Dr. Robinson replied, probably 1,000 yards, which would be amply sufficient, if the observations were obtained throughout that range with a sufficient degree of precision.

Dr. Robinson communicated a Catalogue of Mean Places of 50 Telescopic Stars, within two degrees North Polar distance, observed at Markrea Castle, county of Sligo, by E. J. Cooper, Esq.

Sir David Brewster made the following provisional reports:—

1. 'Meteorological Observations at Inverness.'—These observations were begun on the 1st of November, 1842, and will be completed on the 1st of November, 1843. The observations with Osler's anemometer commence and terminate at the same date. The accompanying letter, from Mr. Gray contains farther details on the subject. It is to be hoped that the Association will authorize the continuation of the hourly observations, &c. for another year.

2. 'Meteorological Hourly Observations at Unst.'—These observations, which are not yet reduced, commence on the 16th of May, 1841, and terminate on the 16th of May, 1842. By some inexplicable accident, the observations with the *external thermometer* were omitted, or rather the thermometrical observations were made within the apartment. The observations, which are very interesting and valuable in other respects, were under the superintendence of Dr. Edmonstone, of Bath Town. From the circumstance already mentioned, it will be necessary to have another year's observations made at this station.

3. 'On the Action of different Bodies on the Spectrum.'—These observations have been carried on since last meeting of the Association, and the properties of various rare substances have been examined. Owing to the great want of sunshine in the locality of St. Andrew's this year, my observations on the direct solar spectrum have been comparatively few. In a short communication to the Physical Section, I shall have occasion to mention a few of the results obtained during other investigations. The pecuniary grant of the Association has not been exhausted, and it would be desirable to continue the balance as a new grant.

Section B.—CHEMISTRY AND MINERALOGY.

'On the Influence of Light on a great variety of Metallic and other Compounds,' by Mr. R. Hunt.—The author, having briefly detailed the numerous discoveries in this branch of inquiry from the time of the alchemists to the present day, proceeded to describe the results of his experiments, made with nearly every variety of chemical combination. It was not in the view of establishing any theory relative to the solar agency that this matter was brought before the Section, but merely to put upon record a great number of facts, which appear to prove the constant acting of the sun's rays upon all bodies, and to show the boundless extent of this inquiry. It has been shown, by

Digitized by Google

Petit, that light influences the arrangements of crystals. Labillardière and Michellotti have shown the necessity of light to the developement of pores in plants, and its injurious influence on young plants and animals. The experiments of Ritter, and others, down to the time of Niepce and Daguerre, have shown many peculiarities in the action of this agent. But since that period the list has been wonderfully increased by the researches of Wollaston, of Davy, of Fox Talbot, and, above all, by the extraordinary discoveries of Sir John Herschel. We are now acquainted with combinations of silver, of gold, of mercury, and of iron with many non-metallic bodies, which are speedily changed under the sun's influence, and which are sufficiently sensitive to be used as photographic agents. The author has been successful in adding platinum to the list of photographic agents; which metal gives considerable promise of utility in the art. He has also been successful in producing photographic images on the salts of manganese, of tin, of antimony, of lead, of cobalt, and of arsenic. He has produced pictures with chlorine, iodine, and chromine vapours received upon the surfaces of a great variety of metals, and even on wood and on leather; and many of the alkaline and earthy salts have given evidence of this extraordinary property of the sun's rays. The author contended, that from the extensive series of results which he had obtained, he was fully warranted in expressing it as his opinion that all bodies were constantly, under the influence of the solar emanations, undergoing a change of state; that, indeed, photographic images were always formed, on whatever body a shadow fell: we were only ignorant of the immediate agency by which these images could be called forth; but we were rapidly arriving at the knowledge we desired.

Many of the photographic specimens on the table were remarkable for the extreme fidelity with which the images were delineated, and the variety of tints they had assumed.

'On Cerium, Lanthanium, Didymium, Terbium, and Erbium,' by Prof. Mosander, of Stockholm, translated by Major L. Beamish, F.R.S.—This important communication contained a technically minute account of the author's experiments (some of which have been published in scientific periodicals,) on cerium, in the course of which he detected two new oxides which he has named lanthanium and didymium. In like manner, his close examination of yttria led him to discover, in combination with it, two oxides, to which he has given the names terbium and erbium.

Dr. TAMNAU, of Berlin, exhibited some rare mineralogical specimens.—1. A group of Datholith, from the neighbourhood of Andreasberg, in the Hartz. 2. Two specimens of rose-coloured Harmotome, from Andreasberg. The colour in these specimens was attributed to the presence of a small quantity of cobalt. They were remarkable for the great size of their crystals, which exhibited not only the usual twins, but also curious and complicated arrangements of three and four, combined according to laws not yet sufficiently understood to allow of their being clearly described. 3. Two very large isolated crystals of Beryl, from Royalstone, Massachusetts. These were of a beautiful sea-green colour, one of them of the usual form, a regular six-sided prism, with the direct terminal face. The other exhibited the faces of the second six-sided prism, of a twelve-sided prism, and of a twelve-sided irregular pyramid. The last of those forms is here observed for the first time.

'On the Production and Prevention of Smoke,' by Mr. Henry Dircks.—Mr. Dircks thought it important to distinguish between open fires, and close fires or furnaces. Open fires would always allow an escape of absolute coal gas, and admit atmospheric air to the chimney; whereas the contrary would be the result with the close fires of engine-boiler furnaces. He said that the leading fact of consequence, in reference to the smoke, was, that it differed materially from the impure gas evolved from the coal in the furnace. The plans hitherto adopted by manufacturers were chiefly intended to burn *smoke*, and the great principle of all such plans was to burn the largest quantity of fuel with the least quantity of air. The error of this method must appear to every one conversant with chemistry. Smoke may be considered as mere carbonaceous matter floating in an atmosphere of the ordinary incombustible products of combustion; the admission of air to this smoke is of no value, as it will only cool it, and make it more readily deposit its sooty particles. The impure gas of the coal, on the contrary, may be inflamed by a due admixture of air. In conclusion, Mr. Dircks begged to state as a general principle, that on the large scale of the furnace, air should be supplied to the impure gaseous products of the fuel by a source independent of that supplying air by the ash-pit to the solid fuel.

Prof. APJOHN inquired whether Mr. Dircks spoke of Mr. Williams's plan of admitting air to furnaces, and on his replying in the affirmative, he said that he had read Mr. Williams's Treatise on the 'Combustion of Coal,' which gave a correct view of the chemistry of the subject, and, indeed, seemed to have almost exhausted it.—Mr. WEST made some remarks on smoke consuming.—Mr. Dircks, in reply, said that he agreed with Mr. West in the possibility of burning smoke, agreeably to popular phraseology, but he did not think it possible in a scientific sense.—The CHAIRMAN explained that Mr. Dircks was correct in his statement, as to the propriety of supplying the air before the gaseous products assumed the state of smoke, at which period only it was available for the proper chemical prevention of smoke.

FRIDAY.

SECTION C.—GEOLOGY AND PHYSICAL GEOGRAPHY.

'On the Lower Portion of the Carboniferous Limestone Series of Ireland,' by R. Griffith, Esq.—This elaborate communication was accompanied by numerous large coloured sections, which illustrated the author's minute descriptions of particular localities. The carboniferous rocks, as subdivided by Mr. Griffith, are in descending order as follows:—1. *The upper limestone* forms the base of the millstone grit series; it averages 600 feet in thickness, and is very fossilliferous in its upper part. 2. *The Calp series* consists of a succession of dark gray slates alternating with dark impure limestone; beds of yellowish sandstone occupy the middle of the series, which is usually 1000, and occasionally 1800 feet thick. The shales of this division contain numerous fossils, especially Posidoniæ, of which there are six species. 3. *The lower limestone* occupies a very considerable portion of the surface of Ireland, and contains a great abundance of fossils; its average thickness is about 1000 feet. The carboniferous slate and yellow sandstone were formerly considered as part of the old red or Devonian system, but from the affinity of their fossils to those of the carboniferous deposits, Mr. Griffith has been induced to include them in the latter system. 4. *The carboniferous slate* contains 274 species of fossils, of which 262 are common to the upper limestone, and 65 are found in the Devonian deposits. 5. *The yellow sandstone* is most fully developed in the northern districts of Ireland, and sections of it are seen on the north coast of Donegal Bay, the northern shore of Lower Lough Erne, and in the counties of Fermanagh, Mayo, and Londonderry. On the north coast of Mayo it rests on beds of the old red sandstone, and attain a thickness of 1460 feet. At Lough Erne the mica slate is covered, unconformably, with 50 feet of red conglomerate, succeeded by yellow sandstone, shale, &c. 150 feet thick, containing calamites and the *Modiola McAdami*. This series of shale and sandstone is continued upwards, through a space of 2900 feet, to the base of the lower limestone: it is impossible at this locality to draw the line of separation between the yellow sandstone and carboniferous slate, but the latter probably includes about 1200 feet of the whole mass. At several other localities the yellow sandstone also rests unconformably upon red conglomerate, apparently belonging to a distinct epoch. The most remarkable and extensive district of yellow sandstone in Ireland occupies the whole of the northern and eastern shores of Lough Foyle, in the county of Londonderry; its lower beds are a conglomerate, formed from the mica slate on which it rests; they are 600 feet thick, and not fossilliferous. The second division of the rocks in this district, which is 500 feet in thickness, contains numerous beds of dark shale and grayish sandstone; and the uppermost consists of red, greenish, and yellowish shales, with numerous thin bands of nodular limestone and red sandstone, passing into quartzose conglomerate, resembling the ordinary old red sandstone. These strata are succeeded by beds of gray shale, white sandstone, and dark gray shale, which in this locality forms the uppermost portion of the series. In the second of these divisions the fossils are numerous, including seven species of Cythere and the *Modiola McAdami*, together with the remains of fish belonging to the genera Gyracanthus, Ptychacanthus, Leptacanthus, and Holoptychius. In the third division, which is about 1400 feet thick, fossils occur only in the conglomerate limestone; they consist of several species of Orthis, Spirifer, &c. This deposit differs in some respects from the usual appearance of the yellow sandstone and carboniferous shales, but from the evidence of the fossils Mr. Griffith is induced to refer it to that deposit. The last important locality described by the author is the carboniferous valley of Ballinamore, in the county of Leitrim, between the old slate range of the Cairnclonhugh mountains of Longford and the millstone grit district of Slieve aneerin, in the county of Leitrim. In this valley the slate rocks are succeeded, unconformably, by sandstone conglomerates, impure arenaceous limestone, and dark gray shale with thin beds of sandstone, altogether about 70 feet in thickness. These are succeeded by 150 feet of yellowish quartzose sandstone, and 100 feet of limestone, dark shale, and calcareous sandstone, above which the carboniferous slate, lower limestone, calp shale, and upper limestone occur in regular succession up to the millstone grit of the Slieve aneerin mountains. In the lowest calcareous strata of this locality were discovered numerous species of Cythere, the *Modiola McAdami*, the *Oracanthus Milleri*, and other ichthyolites, and several plants. The limestone above the shale also contained numerous plants, and abundance of *Orthis crenistria*, &c. in its upper beds. The carboniferous slate and other beds contained the Fenestellæ and other usual fossils in abundance. At Cultra, on the southern shore of Belfast Lough, are a series of strata formerly considered by the author as a part of the new red sandstone and magnesian limestone group, but from an examination of the fossils last year, he has ascertained that they are coeval with the deposits of the valley of Ballynascreen. The beds consist of red sandstone, and contain casts of four species of Cucullæa, *Pullastra antiqua*, several Nuculæ, and a Cypricardia. The shales overlying these beds contain in abundance the scales of *Holoptychius Portlockii*, together with fifteen species of Cythere, *Modiola McAdami*, *Orthoceras regulare*, *Cypricardia socialis*, and five species of Cucullæa. In the southern portion of this section, commencing on the shore of Strangford Lough, the limestone of Castle Espie is shown, also resting unconformably on the old slate. It contains *Actinoceras Simmsii*, *Producta gigantea* and *latissima*, *Orthis cylindrica*, *Spirifer imbricata* and *glabristria*, and *Cyathophyllum fungites*. The limestone is succeeded by various coloured sandstones, extending northward to Scrabo Hill and the old slate ridge of the Ards peninsula. From a review of all these sections, and a careful comparison of the lists of fossils obtained from them, Mr. Griffith has been induced to class these deposits with the lowest members of the carboniferous series.

Mr. MURCHISON pointed out the connexion between the "Cambrian slates" of the counties Down and Armagh with the Silurian rocks of the Mull of Galloway and the Lammermuir hills, containing graptolites and other fossils. He suggested that as some of the beds coloured as old red sandstone by Mr. Griffith contained upper Silurian fossils, they might belong to that series; whilst the upper beds of the same rock appeared, from Mr. Griffith's paper, rather to belong to the carboniferous series, and probably represented some of the beds seen on the banks of the Tweed.—Mr. PHILLIPS stated that although the carboniferous series of Ireland was extremely well developed, yet no classification could be derived from it without a comparison between it and its equivalents in other countries, and he believed the classification already proposed for England would be found equally applicable to Ireland. The yellow sandstone was also found in Pembrokeshire, covered by several hundred feet of carboniferous shales with organic remains, forming the equivalent of the carboniferous slate of Ireland; the limestone, shales, and millstone grit, still higher up, contained the same organic remains, and represented the upper part of Mr. Griffith's series. The old red sandstone had

Digitized by Google

been considered by Mr. Conybeare as a part of the carboniferous series, and in countries where it was not well developed, this classification might have sufficed; but in Pembrokeshire the old red sandstone was 3500 feet thick, and proceeding eastward, in Herefordshire, it was augmented to 4000 feet; whilst in the borders of the Forest of Dean, the whole series, of conglomerates, cornstones, and sandstones, from the Silurian rocks at their base to the mountain limestone above, formed a series 7000 feet in thickness. Such a mass must have required a great lapse of time for its formation, especially as its component beds were due to many distinct mechanical and chemical forces. During this interval beds were forming in Devonshire, the Eifel, and Russia, containing groups of shells and fishes sufficiently characteristic in themselves to constitute a distinct system.—Mr. LYELL observed that the yellow sandstone of Ireland closely resembled the beds of passage between the old red sandstone and the carboniferous strata in Scotland; he also remarked upon the similarity of the Irish carboniferous deposits to the coal-fields of North America, the number of fossil plants identical in each deposit proved the similarity of the laws which regulated the distribution of organic life, and also the great uniformity of climate during that distant epoch in England and America, the principal features remaining the same amidst all the local variations.

SATURDAY.

'Notice of the Ordnance Geological Museum,' by J. Phillips, Esq., F.R.S.—The Ordnance Museum has for its object two purposes, both bearing on geological science. The first of these is to procure, during the progress of the Ordnance Geological Survey, now under the direction of Sir Henry De la Beche, an accurate delineation of the boundaries of all the strata; not laid down conjecturally, but from actual observation and exact measurement. For this purpose there is attached to the Trigonometrical Survey a staff of active geologists, who walk over the boundary lines and draw sections, in which every part is measured and laid down on a scale true to nature. The practice of making the vertical scale of sections greater than the horizontal had led to much mischief and many mistakes, especially in mining operations, and in working for coal. The second object of the Museum was to form a collection of the fossils of every stratum in every possible locality, with the view to ascertain the law of geographical distribution of species, and their geological distribution in successive strata. It was usual for geologists to collect only fine and beautiful specimens; but this system would never enable them to trace the exact areas of distribution of organic life in former epochs. In connexion with this system of collecting organic remains, a method of drawing them had been proposed: each species, as soon as sufficient information could be procured, was to be drawn by good artists, with magnified views of minute structure; and these were to be engraved on steel, a separate plate being given to each species, and published at so low a price as to place them within the reach of all persons interested in the science. Mr. Phillips invited collectors of fossils to give their aid in forwarding this work, by lending specimens of rare or new fossils, and announced that in such cases electrotype impressions would (if approved) be taken of them, so as to supply museums and collectors with correct representations of unique or valuable fossils. In conclusion, Mr. Phillips stated that the Ordnance Museum would be eventually opened to the public as freely as any institution of the same nature.

Mr. GRIFFITH stated, that in the progress of the Ordnance Survey of Ireland he had obtained 950 species of fossils in the carboniferous series alone, 200 of which were new or undescribed. All these had been, or would be, engraved and published at his own expense; but the Silurian fossils, which he had also collected, should be forwarded to the Museum in London, to be published by the Director of the Ordnance Survey.

'Report on the Excavation made at the Junction of the Lower New Red Sandstone with the Coal Measures at Collyhurst, near Manchester,' by E. W. Binney, Esq.—The rocks of the new red sandstone series, in the vicinity of Manchester, are described by Mr. Binney as occupying hollows previously formed by great dislocations in the carboniferous strata. Along the valley of the Irk the upper new red sandstone, the magnesian limestone, and the lower new red are exposed in succession; but as the absolute point of contact between the coal measures and lower new red sandstone had not been seen, a deep cutting was made at a place called Tinker's Brow, about one mile N.E. of the Manchester Exchange. The different beds were thus described by Mr. Binney in descending order. 1. *The till*, locally known as *marl* and *brick clay*, containing blocks of granite, sienite, porphyry, greenstone, basalt, and various other igneous rocks; clay slate, Silurian rocks, mountain limestone, chert, millstone grit, ironstone, &c., from the coal series, magnesian limestone, and the waterstone of the upper new red. These fragments are of various sizes, the largest being five tons in weight, and are mingled together without any order of deposition: near the edge of the great fault they are larger and more numerous than in any other part of the till near Manchester. Those boulders, such as the granites, porphyries, and hard slate rocks, which do not occur *in situ* within 100 miles of Manchester, are mostly well rounded, and some are scored with striæ and polished; whilst those found in the neighbourhood, such as mountain limestone, &c., are less striated and polished, and many are quite angular. Although the boulders occur in the clay, without any distinct lines of deposition, there occurs at one point a deposit of fine laminated silt and sand, ten or twelve inches thick, and about a yard from the bottom of the till, which is twenty-one feet in thickness, and rests on an uneven surface of lower new red sandstone, evidently waterworn; in some places holes two or three feet deep being found occupied by the till. 2. Lower new red sandstone; composed of dark red sand, variegated by patches of a yellowish-drab colour; its thickness is full forty yards; the main dip is to the S.W., at an angle of 16° to 18°, but it has also a considerable inclination to the N.W. No fossil remains have been found in it. 3. *The Coal Measures;* consisting of a bed of salmon-coloured argillaceous shale, thirty feet thick, containing impressions of *Neuropteris cordata*, and many common coal plants. The coal measures were partly elevated before the deposition of the new red sandstone formation, but it is evident that the latter have been raised by forces which have subsequently elevated the coal measures, as the similarity of dip in both strata testifies.

Mr. HOPKINS observed that the occurrence of a bed of silt, evidently deposited by a current of water, in a deposit so ambiguous as the till, would probably remove the difficulty of accounting for its origin; since, to whatever cause one part was attributed, the other must also be referred. He did not consider the angularity of certain fragments in the till an objection to their having been transported; at the same time remarking the difficulty of separating the causes of effects, where the efficiency of each of those causes could not be doubted.—Mr. LYELL reminded the Section that those geologists who attributed the occurrence of boulders in the till to the agency of floating ice, always assumed the action of currents in the distribution of the material in which they were imbedded.—Mr. PHILLIPS remarked the similarity in the circumstances and phenomena presented by the till of Collyhurst with the deposit at Holderness, described in his 'Geology of Yorkshire.'

'On certain Movements in the Parts of Stratified Rocks,' by J. Phillips, Esq., F.R.S.—Mr. PHILLIPS stated that for many years the attention of geologists had been called in a very essential degree to the internal structure of rocks; but notwithstanding the advances made by Prof. Sedgwick and Mr. Hopkins, there were points still remaining to be investigated, before mathematicians could explain the forces by which these phenomena had been produced; because any such explanation must be based upon data afforded by the actual constitution of the rocks themselves. Twenty years since, he had observed such remarkable symmetry in the crystalline forms of prismatic masses of slate in Westmoreland, that he had measured their planes, and satisfied himself that they were not of the nature of ordinary crystallization, and that the term, crystalline structure, as usually applied to them, was by no means legitimate. In order to understand the nature of the mechanical forces which have produced the cleavage, it is important to study it in its relation to every form of strata. Where the contortions do not affect the cleavage planes, it is evident that they were first formed; the joints and fissures which interrupt the cleavage but do not disarrange it, were probably posterior, like many of the faults which interrupt the strata and cut off the cleavage. When layers of concretionary ironstone occur in slaty rocks, the cleavage planes are arrested and "troubled" in their passage through them, from which it appears that the nodules had become solid previously to the strata being divided by the planes of cleavage. Several attempts had been made to imitate cleavage structure. Mr. Fox, of Cornwall, had caused electric currents to pass through moistened clay, and had thus produced fissures parallel to the bounding surfaces of the mass, and this illustration Mr. Phillips considered very important, but incomplete. The cleavage planes of the slate-rocks of Wales were, he stated, always parallel to the main direction of the great anticlinal axes, but were not affected by the small undulations and contortions of those lines. In North Wales they maintained the same direction for fifty miles, not varying more than two or three degrees, which might be owing to local causes, such as the movement of masses by gravity at a period subsequent to the formation of the cleavage. In making observations upon the cleavage of rocks, care must be exercised not to confound with those phenomena the marks produced by the mechanical movement of one rock upon another. The shells in slaty rocks were generally distinctly marked by ferruginous lines, caused by their decomposition, and the form of their outlines was often remarkably changed. The Leptænæ in North Devon occasionally assumed the form of nuculæ, and the Spirifers were crumpled up, or else extremely attenuated. The Trilobites of the Llandeilo flags were found in three distinct forms, arising from the distortion taking place in a longitudinal, transverse, or oblique direction; this seemed to be the result of a "creeping" movement of the particles of the rock along the planes of cleavage, the effect of which was to roll them forward, in a direction always uniform, over the same tract of country; the movement does not seem to have affected the hard shells, but those which were thin, as also the algæ and trilobites: the latter are covered with little folds, parallel to the wave of motion. In these distorted fossils the amount of movement might be estimated; as, in the space occupied by a trilobite, it amounts to half an inch. Mr. Phillips had selected these facts, bearing the aspect of real and general laws of structure in rocks, from a series of classed phenomena on the subject, because he regarded them as positive steps towards a mechanical theory of the series of changes by which the structural characters and accidents of position were to be determined.

Mr. HOPKINS remarked that Mr. Sedgwick had been the first to ascertain the true relation of the slaty structure of rocks to their original bedding. The phenomena of *cleavage*, he thought, could only be accounted for by internal forces; and it was extremely difficult to estimate the effects of the molecular action of one part of a rock upon another, and required a more accurate mathematical analysis than we now possess.—Mr. Phillips, in reply to a question from Mr. Lyell, stated that he had collected sufficient data to determine the limits of the period during which the phenomena of cleavage had been produced in South Wales. All the great anticlinals in South Wales, and he believed also in the South of Ireland, had affected alike the Silurian rocks, the old red sandstone, and carboniferous slates, the shales above and below the mountain limestone, and all the coal strata. The magnesian limestone rests in such a manner as to indicate that these movements had taken place previously to its deposition. The cleavage must therefore have taken place subsequently to the newest coal strata, but without affecting more modern formations. Mr. Phillips then alluded to phenomena resulting from the action of heat, which, although quite of another nature, might still bear on the question. Near Newcastle a whin dyke, twenty-four feet in thickness, cuts through shales containing plants which mark the plane of stratification, to the distance of ten feet from the dyke; these lines of bedding are entirely obliterated, and in their place a series of perpendicular fissures are produced, parallel to the dyke.—Mr. BINNEY observed that the coal shales, when subjected to the intense heat of a furnace, often exhibited vertical lines of cleavage, breaking them up into

Digitized by Google

hexagonal prisms. The coal itself presented, usually, three directions of cleavage—one parallel to the lines of bedding, one at right angles to it, and the third in a diagonal direction. He mentioned a Sigillaria, one foot in diameter, which had been found upright in the Pennant coal. The bark of this plant was converted into bituminous coal, with vertical cleavage, whilst that of the interior had the rhomboidal character. Mr. Binney also announced (as we mentioned last week) the discovery of an *upright tree*, nine feet high, in the coal strata at St. Helen's, near Liverpool.

'On the "Permian System" as applied to Germany, with Collateral Observations on Synchronous Deposits in other Countries; showing that the Rothe-todte-liegende, Kupfer Schiefer, Zechstein, and the lower portion of the Bunter-sandstein form one natural group, constituting the upper member of the Palæozoic Rocks,' by R. I. Murchison, Esq.—The word *Permian*, when first proposed by Mr. Murchison, was intended to distinguish a natural group of deposits, lying between the well-known carboniferous strata beneath and the less perfectly defined trias above it. The author at first suggested that the group (so designated from the ancient kingdom of Permia, which is exclusively occupied by it,) should combine those deposits known under the name of Rothe-todte-liegende (lower new red of England), Kupfer Schiefer, Zechstein, &c. (magnesian limestone, &c.) Subsequently, however, he was disposed to doubt whether it might not be more correct to class the Rothe-todte-liegende with the coal-bearing deposits beneath it, than with the Zechstein, because the plants of the lower red sandstone could not be distinguished from those of the coal measures. Revisiting Hesse, Saxony, Silesia, the Thuringerwald, and other parts of Germany, Mr. Murchison has obtained what he considers proof that the Rothe-todte-liegende is part and parcel of the same natural group as the Zechstein, and must therefore be considered part of the Permian system. He has also convinced himself that the great deposit hitherto known under the denomination of Bunter-sandstein, Grès bigarré, or new red sandstone, should be divided into two parts, the lower of which ought to be classed with the Permian, and separated from the trias, with which it had been merged. To prove the first of these positions, or that the Rothe-todte-liegende is a part of the Permian group, Mr. Murchison cited the order of succession in numerous sections in Germany, showing an uninterrupted sequence from the lower red conglomerate sandstone and shale into the overlying Zechstein. It is a question whether the plants of these lower red rocks can be distinguished, as a whole, from those of the subjacent coal measures, plants being, as yet, the only organic remains found in them. From his observations in Saxony, and particularly from an inspection of the fossil plants collected and partly described by Captain Gutbier, Mr. Murchison believes, that such a separation exists. Among the coal plants of Saxony are forms of Neuropteris closely approaching to, if not identical with, those species which occur in the Permian rocks, whilst there is no trace of the common plants of the under-lying coal. These plants being imbedded in a whitish or cream-coloured finely levigated clay-stone, and their leaves being brought into beautiful relief by being invariably as green as if they had peculiarly and happily dried in an herbarium, form admirable subjects for the most precise distinctions of the fossil botanist. In Silesia (at Ruppendorf, and other localities west of Waldenberg, between Breslau and Glatz) there is a fine developement of strata from the base of the Rothe-todte-liegende (where that deposit overlies a productive coal-field based upon true mountain limestone) into other red sandstones and shales, which have a marked aspect, from being interlaced with bands of black, bituminous, thin, flaggy limestone. Though doubts had been entertained as to the age of this limestone, Mr. Murchison does not hesitate to consider it as the equivalent of the Zechstein, and the whole red group of which it forms a member as the counterpart of the Permian system; for, besides its very clear position, this calcareous flagstone contains plants and fishes similar to those of the Permian rocks of Russia. Among the former the *Neuropteris conferta, nov. spec.*, of Göppert, has been identified with the most common fern brought from Russia. The most abundant fish is the *Palæoniscus Wratislaviensis*, Ag. On this occasion Mr. Murchison passed rapidly over the zoological proofs that the Zechstein and Kupfer Schiefer of Germany are the equivalents of the calcareous beds of the Permian system of Russia, as these had been given in detail in memoirs read before the Geological Society. He stated, however, that his opinion was now perfectly in harmony with that of Prof. Phillips; namely, that the Fauna of the Zechstein, or magnesian limestone, has so much of the same general zoological type as the carboniferous limestone, that it must also form a part of the palæozoic series. Mr. Murchison then proceeded to consider the age of these lower beds of the Bunter-sandstein, which had been hitherto included in the trias, on lithological evidence only. They contain no fossils, either in Hesse, Saxony, or Thuringerwald, where the Zechstein and Kupfer Schiefer are most developed; and from all Mr. Murchison's inquiries and observations, it appears that the upper mass only of the Bunter-sandstein contains the remains of animals and plants analogous to those of the Muschelkalk which rests upon it. The footmarks of the Cheriotherium appeared also to be confined to the beds of sandstone, at a very little depth below the Muschelkalk. From these circumstances Mr. Murchison was induced to regard the upper beds alone of the Bunter-sandstein as belonging to the trias, whilst the lower portion, which, though generally unfossilliferous, contained in Russia the same groups of fossils with the Permian rocks, he proposed henceforth to separate from the secondary system, and consider it, together with the Zechstein and Rothe-todte-liegende, as the upper member of the palæozoic series, supposed to be represented by a thin band of dolomite. The plants of the Permian system of Russia appear, from the opinion of M. Adolphe Brongniart, to possess a peculiar character; but they are still closely allied to carboniferous forms, like the plants of the Rothe-todte-liegende of Saxony; and this evidence is in complete harmony with that afforded by the molluscs, corals, and ichthyolites. In conclusion, Mr. Murchison remarked that the English strata ranging under the synonym of Permian, formed a well-defined tract, separating the coal-fields from the newer deposits of red sandstone and marl; and as the magnesian limestone does not often appear in the form of a continuous deposit, it was the more desirable to give a certain latitude to this group, and not to define it too narrowly by mere mineral characters. Thus considered, Mr. Murchison believed the Permian system had a real existence in Ireland, being represented by those beds containing the *Productus aculeatus*, and probably also by the red sandstone with the *Palæoniscus catopterus*, at Rhoan Hill, near Dungannon.

Mr. GRIFFITH said, that the red sandstone of Rhoan Hill belonged to the lowest part of the new red series in Ireland.—Mr. PHILLIPS stated that the dolomitic conglomerate of Bristol rested unconformably on the mountain limestone, and no further evidence of its relation to the magnesian limestone had been obtained by the Ordnance Survey besides the Saurian remains originally discovered by Dr. Riley and Mr. Stutchbury.—Mr. LYELL remarked that the similarity of the sedimentary deposits produced by rivers in different parts of the world, at the present day, afforded confirmation of the identity of distant deposits, having similar mineral characters, and the same place in the series. He considered the occurrence of remains of Thecodont Saurians in the Bristol conglomerate a strong proof that it belonged to the same age with the Zechstein of Germany, containing a Saurian presenting the same peculiarities of structure; namely, the dentition of the crocodile, combined with the vertebræ, sternum, and extremities of the lizards. He also referred to the discovery of the tracks of a reptile, associated with a series of corals and shells, low down in the carboniferous series of Nova Scotia, the rocks in which they occurred being covered by a vast series of deposits containing a large series of plants, nearly every one of which was identical with species found in the English coal measures.—Mr. BINNEY stated that foot-marks of the Cheirotheria had lately been found in the middle of the Bunter-sandstein of Cheshire, together with three fish belonging to the genera Cœlacanthus, Platysomus, and Palæoniscus, scarcely distinguishable from coal measure species.

Mr. HOPKINS explained his views respecting the cause of the Motion of Glaciers.—De Saussure had adopted the theory which attributes this motion to the resolved part of gravity acting along the inclined surfaces on which all glaciers in motion are situate; and he explained, also, how the motion would be facilitated by the effects of the internal heat of the earth, and of subglacial currents. When the attention of philosophers, however, was recalled a few years ago to this subject, and more accurate observations and admeasurements were made, the inclinations of the beds of glaciers were found, in many cases, to be so small (in the glacier of the Aar, for example, not exceeding three degrees), that it appeared extremely difficult to conceive how the force of gravity alone could be adequate to overcome the friction on the bottom and sides of the glacier, and the numerous local obstacles to its movement. Numerous experiments on the descent of bodies along inclined planes had shown, that when the surfaces of the bodies and planes were perfectly hard and polished, no motion would ensue without an inclination considerably greater than that of many glaciers; and, moreover, that the inclination required to produce motion was independent of the weight of the sliding body. These considerations led to the very general rejection of De Saussure's theory, and to the adoption, by many persons, of the *dilation theory*, of which M. Agassiz had been the principal advocate. According to this theory a part of the water produced by the dissolution of the superficial portion of the glacier during summer passed, by infiltration, into the minute pores and crevices of the glacier, where it was again converted into ice, and by its expansion in the process of freezing produced a *dilation* and consequent motion of the glacier. It was manifest, however, that the frequent alternation of freezing and thawing within the glacier which this theory assumed, could not possibly take place at depths beneath its surface exceeding a very few feet, and therefore could not produce any sensible effect on the motion of the whole mass. This theory presented many other difficulties, of which no adequate solution had been given; and the author could not but consider it as contrary to the most obvious mechanical and physical principles. Another theory had also been put forward, which attributed the motion of glaciers to the expansion of water in the act of freezing, after it had filled, not the minute pores of the ice, but internal cavities of considerable dimensions. But, since the temperature of the glacier at considerable depths must be sensibly constant, how were new cavities to be formed when existing ones had been once filled up? The author, regarding both this theory and the preceding one as untenable, was thus led to examine how far the apparent objections to De Saussure's theory were really valid, by a series of experiments on the descent of ice down inclined planes. The experiments were made in the following manner: a slab of sandstone, prepared to be laid down as a part of a common flagstone pavement, was so arranged as to be easily placed at any proposed inclination to the horizon. The surface of the slab, so far from being polished, retained the grooved marks of the instrument with which the quarry-man had shaped it. A quantity of ice was placed on the slab, within a frame nearly a foot square, intended merely to keep the ice together, and not touching the slab, with which the ice alone was in contact. The following were results obtained in one set of experiments, the ice being loaded with a weight of about 150lb.:—

Inclination of the planes	3°	6°	9°	12°	15°
Mean space for one hour	inches 0.31	.62	.96	2.	2.5

When the weight was increased, the rate of motion was also increased. The least inclination at which sensible motion would take place, was not determined; but it was ascertained that it could not exceed *half a degree* in the case of a smooth but unpolished surface. With a *polished* surface of a marble slab, the motion of the ice indicated a deviation from horizontality with as much sensibility as water itself. It will be observed, in the results above given, that (1) the motion was unaccelerated; and (2) it increased with the inclination, and (when the inclination was not greater than nine or ten degrees) in nearly the same ratio; and (3) the rate of movement was of the same order of magnitude as in actual glacial motion, which may be stated generally, in cases yet observed, never to exceed two feet a day. The extremely small friction between the plane and the ice, indicated by the small inclination necessary to produce motion, was manifestly due to the circum-

Digitized by Google

stance of the lower surface of the ice being in a state of gradual disintegration, which, however, was extremely slow, as proved by the small quantity of water proceeding from it. In the application, therefore, of these results to the case of actual glaciers, it was necessary to show that the temperature of their lower surfaces could not generally be less than 32° Fahr. Such, the author stated, must necessarily be the case, unless the conductive power of ice was greater than it was deemed possible that it could be. He considered the sub-glacial currents as powerful agents in the disintegration of the lower surfaces of glaciers, especially near their lower extremities. The results of Prof. Forbes's observations on the motion of the Mer de Glace of Mont Blanc, afforded, as regards that glacier (and, by inference, as regards all other glaciers) a complete refutation of the theories which attribute glacial movements to any expansion or dilation of the ice. The Professor had, however, put forth a new theory, which agreed with that offered by Mr. Hopkins in attributing glacial motion to the action of gravity, but differed from it entirely as a mechanical theory, in other respects. The Professor appeared to reject the sliding theory of De Saussure, on account of the difficulties already mentioned (which were now removed by the above experiments), and assigned to the mass of a glacier the property of *plasticity*, or *semifluidity*, in a degree sufficient to account for the fact of its descending down surfaces of such small inclination. According to this theory, the motion was due to the small cohesion of one particle of glacial ice to another. Mr. Hopkins stated his conviction that the internal cohesion of the mass was immensely greater than its cohesion to the surface on which it rests, whenever the lower surface is in a state of disintegration. It was perfectly consistent with this conclusion to assign to the glacier whatever degree of *plasticity* might be necessary to account for the relative motions of its central and longitudinal portions under the enormous pressure to which, according to his theory, he showed it might be subjected. Such relative motions, however, were probably facilitated more by the *dislocation* than the plasticity of the mass. Sufficient, he trusted, had been advanced to prove that the *sliding theory* assigned a cause adequate to the production of all the observed phenomena of glacial movements. With respect to the transport of erratic blocks and detritus from the Alps to the Jura, Mr. Hopkins observed that the greatest height which glaciers had formerly attained in the valley of the Rhone (whence a large portion of the erratics had been derived), appeared to be well defined by lateral moraines and polished rocks, while the greatest height at which these blocks had been deposited on the Jura was also well defined. Thus, according to M. Charpentier, the Rhone glacier must have risen, at the mouth of the valley, to about 2,500 feet above the existing surface of the Lake of Geneva; while the highest band of detritus on the Jura was stated to rise to a still higher level. It was inconceivable, therefore, that such detritus should have been lodged at its present elevation by former glaciers. The only way in which it appeared possible to obviate the mechanical difficulties of the subject, was to suppose the transport to have been effected when the Jura was at a lower level relatively to the Alps, and the whole district lower relatively to the surface of the ocean. In such case, the space between the Alps and the Jura may have been occupied by the sea, and the ice, with its transported materials, may have passed from the former to the latter chain, partly with the character of a glacier, and partly with that of an iceberg. This hypothesis is perfectly consistent with the supposition of the general configuration of the surface of the Jura having been the same at the epoch of the transport as at the present time; and Mr. Hopkins believed it would be found equally so with all the observed phenomena of that region.

Col. SABINE related, in illustration of the agency of glaciers in transporting rocks, that when the Antarctic Expedition had reached 79° S. lat., the vessels were stopped by a barrier of ice, from 100 to 180 feet in height, and 300 miles in extent from east to west; beyond these cliffs of ice they discovered a range of lofty mountains, 60 miles from the sea, the westernmost of which appeared to be 12,000 feet in height. From the face of these ice-cliffs vast masses were constantly breaking off and floating northward, bearing with them fragments of the rocks which they had derived from the mountains. In the latitude of 66° and 67°, a distance of 700 miles from the glacier, these floating icebergs appeared to be usually arrested so as to form a floating barrier, at which ships were often stopped; and it had been observed, that between this zone and the cliffs, the sea deepened considerably. Over all this area the icebergs would be constantly strewing masses of rock and detritus, particularly at their northern limit, where they would probably form mounds resembling terminal glacial moraines. Colonel Sabine then described similar phenomena in Baffin's Bay, which he stated to be, in most parts, deeper than the thousand-fathom line, but shallow at the strait which forms its entrance. The bay was surrounded by alternate cliffs of rock and valleys occupied by glaciers, and presenting cliffs of ice along the shore, from which masses became detached and floated off to the zone of shallow water at the entrance of the bay, where they were constantly becoming arrested in their progress, and deposited the fragments of granite, trap, and limestone containing fossils, derived from the shore.

'Report of the Committee on Earthquakes in Scotland.'—The Committee state, that from the end of June, 1842, to the 1st of July in the present year, thirty very slight shocks of earthquakes have occurred at Comrie, in Perthshire, and have been registered by Mr. M'Farlane, who has the charge of the instruments belonging to the Association. The last autumn he stated to have been particularly dry, and the barometer seems to have been unusually low at the time of the shocks. The first shock took place on the 24th of Sept., 1842: the inverted pendulum in the steeple of Comrie Church was moved one-eighth of an inch to the S.E., and the common pendulum to the same distance eastward. The instruments were slightly affected on two other occasions. Earthquake shocks were also felt on the 19th of August, 1842, at Pitlochey, near Dunkeld, and on the 25th of Feb. and 3rd of March, 1843, at Oban and Lochgilphead, in Argyleshire. Shocks were also stated to have been noticed in North Wales, on the 22nd of August, 1842, and near Manchester, on the 10th and 17th of March, 1843. The nature of all these shocks is recorded as very similar to those described in last year's Report.

SECTION F.—STATISTICS.

Sir W. Chatterton presided, in the absence of Sir Charles Lemon.

Mr. BIANCONI was called on to read a paper promised by him on a former day. The following was then read, which, on account of its personal and national interest, we give verbatim:—Up to the year 1815, the public accommodation for the conveyance of passengers in Ireland, was confined to a few mail and day coaches on the great lines of road. From my peculiar position in the country, I had ample opportunities of reflecting on many things, and nothing struck me more forcibly than the great vacuum that existed in travelling accommodation between the different orders of society. The inconvenience felt for the want of a more extended means of intercourse, particularly from the interior of the country to the different market towns, gave great advantage to a few at the expense of the many, and above all, occasioned a great loss of time; for instance, a farmer living twenty or thirty miles from his market town, spent the day in riding to it, a second day doing his business, and a third day returning. In July, 1815, I started a car for the conveyance of passengers from Clonmel to Cahir, which I subsequently extended to Tipperary and Limerick. At the end of the same year I started similar cars from Clonmel to Cashel and Thurles, and from Clonmel to Carrick and Waterford; and I have since extended this establishment so as to include the most isolated localities, namely, from Longford to Ballina and Bellmullet, which is 201 miles north-west of Dublin; from Athlone to Galway and Clifden, 183 miles due west of Dublin; from Limerick to Tralee and Cahirciveen, 233 miles south-west of Dublin; and numbering 110 vehicles, including mail coaches and different sized cars, capable of carrying from 4 to 20 passengers each, and travelling 8 to 9 miles per hour, at an average fare of one penny farthing per mile for each passenger, and performing daily 3800 miles, passing through more than 140 stations for the change of horses; consuming 3 to 4000 tons of hay, and from 30 to 40,000 barrels of oats annually; all of which are purchased in their respective localities. These vehicles do not travel on Sundays, unless such portions of them as are in connexion with the post office or canals, for the following reasons: first, the Irish being a religious people will not travel on business on Sundays; and secondly, experience teaches me that I can work a horse eight miles per day for six days in the week, much better than I can six miles for seven days. The advantages derived by the country from this establishment are almost incalculable; for instance, the farmer who formerly rode and spent three days in making his market, can now do so in one, for a few shillings, thereby saving two clear days, and the expense and use of his horse. The example of this institution has been generally followed, and cars innumerable leave the interior for the principal towns in the south of Ireland, which bring parties to and from markets at an enormous saving of time, and in many instances cheaper than they could walk it. This establishment has now been in existence twenty-eight years, travelling with its mails at all hours of the day and night, and never met any interruption in the performance of its arduous duties. Much surprise has often been expressed at the high order of men connected with it, and at its popularity; but parties thus expressing themselves forget to look at Irish society with sufficient grasp. For my part, I cannot better compare it than to a man emerging into convalescence from a serious attack of malignant fever, and requiring generous and nutritive diet in place of medical treatment. Thus I act with my drivers, who are taken from the lowest grade of the establishment, and who are progressively advanced according to their respective merits, as opportunity offers, and who know that nothing can deprive them of this reward, and a superannuated allowance of their full wages in old age and under accident, unless their wilful and improper conduct; and as to its popularity, I never yet attempted to do an act of generosity or common justice, publicly or privately, that I was not repaid tenfold. In conclusion, Mr. Bianconi regretted that the shortness of the notice which he had received to meet the Association, should have rendered it impossible for him to prepare a document more ample in details and more worthy of the Section.

Dr. W. C. TAYLOR read a paper 'On the Pauper Lunatics of Ireland,' the materials of which he stated to have been supplied by the Earl of Devon. Before the year 1817, a few cells in gaols and houses of industry were the only accommodation provided for lunatics; but in various parts of Ireland, and more especially in Kerry, certain secluded glens, called madmen's glens, were, by the tacit consent of the peasantry, set apart for the use of idiots and the insane. In 1817 district lunatic asylums were formed, and placed under the superintendence of government officers. A table was exhibited of the districts for which these hospitals were established, the population of these districts, the number of patients admitted from the contributory counties; but as these give insufficient accommodation, cells for the insane are connected with several of the old houses of industry, where proper medical treatment of the insane, however, is utterly impossible. The author strongly condemned the system of confining lunatics in houses of industry, or, which is still worse, in gaols. By an act passed in the first session of the present reign, power is given to two justices of the peace, acting under the advice of a physician, to commit to gaol, or confine in a lunatic asylum, any one thought to be in a state of mind threatening mischief. It would seem that this statute has operated more widely than could have been anticipated by its framers. From the Sixteenth Report of the Inspectors General of Prisons, it appears, that so recently as the year 1837, there were but 37 insane patients confined in the gaols of Ireland. But in 1840 the number of lunatics confined in the gaols of Ireland had increased to 110; and within the last two years the number has doubled, there being now 240 lunatics and idiots in the gaols of Ireland. There are also 471 idiots and lunatics at present confined in 69 workhouses.

Mr. DOWDEN read a brief essay 'On the Effect of Light as a part of Vital Statistics.' It stated rather the means by which inquiries on this subject could be conducted, than the results which have been obtained.

FRIDAY.

SECTION G.—MECHANICAL SCIENCE.

Mr. J. HAWKINS described a practice which has lately been adopted in some parts of the United States, of procuring oil and spermaceti from pigs. The pigs are driven into the woods to feed, and after some months they are brought back and fattened with Indian corn. The animals are then killed and boiled altogether, for the purpose of extracting all the lard, which is then converted into *stearine* and *elain*. The oil thus procured is of a remarkably fine quality, and well adapted for lubricating machinery.

Mr. BOOTH described an apparatus for raising miners and minerals from the deep vertical shafts of mines. It consists of a revolving inclined plane, or endless screw-shaft. The threads of the screw are made to act on the peripheries of small wheels extending from the carriage in which the miners, &c. are placed. A rotary motion is communicated to the shaft, and the carriage is raised or lowered according to the direction in which the screw is turned.

Mr. RUSSELL resumed his paper, 'On the Construction of Public Buildings with reference to Sound.'—In the former part of the paper he had shown the method by which spectators and auditors could be arranged in a given room in such a manner that all could see and hear equally well (see *Athen. ante*, p. 780). He next entered into a scientific analysis of the nature and causes of the evils which are experienced in public buildings of a large size and of the usual forms—in so far as these may be deduced from the received laws of sound. These he classed as follows: 1st, Evils arising from reflexion of sounds. 2. Evils arising from spontaneous oscillation, and the independent key-note of the building. In considering this branch of the subject, an explanation was attempted of the fact, that buildings have a key-note and pitch; and a rule for finding that pitch, practically and theoretically, was adduced. 3. Evils arising from interferences of sound, owing to the disproportions and forms of buildings. These evils were all to be remedied by the adoption of the form given in the paper; and, on that construction, he had satisfied himself, that five, ten, or even twelve thousand people might be so arranged as to hear a single voice easily and comfortably. The second part of the paper examined certain phenomena in sound, with which we had not formerly been acquainted. Our knowledge of the laws of sound rested hitherto on an hypothesis, that the phenomena of sound in the air were analogous to the phenomena of water, when disturbed by dropping a stone on the surface of a smooth lake. In this case it is well known, that the water propagates waves round the point of disturbance in all directions, and that these diffuse themselves in concentric rings over the whole surface. In like manner it was taken for granted, that the sound waves, produced by a sonorous body, are of a similar nature, and the laws of sound had been deduced from this hypothesis. These laws were, however, imperfect and erroneous. Sound did not resemble these waves; therefore analogies deduced from such waves were erroneous. These waves of water are denominated by Mr. Russell, waves of the second order. But there is another kind of wave, the wave of the first order, to which the sound wave bears a remarkable analogy. This wave had been examined in another Committee (in Section A), and the properties of this order of wave enable us to solve many difficulties in the phenomena of sound. The common water-waves of the surface of a smooth lake had this property, that they were transmitted with *various velocities*, according to the circumstances producing the wave; but this was not so in the case of the sound wave, the French Academicians having successfully established, that the velocities of sounds of different intensity and pitch are all transmitted in a fluid in a given condition, with precisely equal velocities; now the chief peculiarity of the sound wave is this *constant of velocity*, independent of the conditions of the impelling cause. Another circumstance, serving to identify the sound wave with the wave of the first order, is the similar characters of the formulæ expressing this velocity. Whereas, the formula expressing the velocity of common water-waves is of a form essentially different. It has further been observed, that there exist in the sound wave, and in the wave of the first order, in water, the same *polarity*, the same law of *diffusion*, the same phenomenon of non-reflexion, at certain angles, and the phenomenon of lateral accumulation. From these data the author went on to give new explanations of the theory of whispering galleries, echoes, the conveyance of sound to great distances across lakes, ice, and other smooth surfaces. He applied the principles thus adduced to the explanation of many evils of certain forms of building not hitherto understood, and proceeded to develope the rules and methods to be adopted for the remedies of those evils.

Sir T. DEANE admitted the errors of architects in regard to the transmission of sound. They, however, were not in general free agents; but had to work with materials and according to instructions, which rendered it difficult for them to adopt the best mode of construction for transmitting sound. He had visited eighteen of the court houses in England with a view to correct the defects in the courts at Cork, but in each of these the very same defects exist. At Liverpool they had effected a remedy by reversing the usual order, and placing the judge in the centre of the semicircular court.

Mr. J. TAYLOR described an immense steam-engine, which is now constructing in Cornwall, for the purpose of draining the lake of Haarlem. The cylinder of this "mammoth" engine is twelve feet in diameter, with a twelve-feet stroke. Round this immense cylinder are arranged eleven pumps, each of them of sixty-three inches diameter, with a nine-feet stroke. The valve at the bottom of the cylinder is on the butterfly construction, which is not generally conceived to be well adapted for large engines.

Mr. E. HODGKINSON, in giving a report of experiments carried on at the request of the British Association, concerning the imperfect Elasticity of Solid Bodies, and the practical results to be deduced from them, entered at some length into a consideration of the consequences of a property of elastic bodies, which he had recently discovered. It appeared, from experiments made by him for the Association some years ago, that the elasticity of bodies is injured by much smaller forces than was generally supposed; and by comparing the results of experiments subsequently made, it was evident, that all changes of form, in rigid bodies, by forces however small, effect a permanent *set* on them, showing that their elasticity is, in some degree, impaired. This continued deteriorating action, Mr. Hodgkinson observed, must have great effect on the power of bodies to resist forces, and ought to be taken into consideration in the calculations on the strength of beams, &c. especially when the materials were subject to vibration or concussion. Mr. Hodgkinson did not enter at much length into the theoretical part of the question, as he intended to make a communication on that branch of the subject to Section A.—(see *ante*, p. 798).

Mr. J. SCOTT RUSSELL observed, that at the last meeting they had nothing but a mass of confusion and a collection of new facts on the subject of the strength of materials, but they had now obtained the law by which all those apparently isolated facts were governed. He considered that time was an important element in the destruction of the elasticity of bodies, and stated, in confirmation of this opinion, that in the course of some experiments he was making, it was necessary to stretch a long wire at one half its tension; but in the course of a week it invariably broke, and he was obliged to substitute a new wire. The internal structure of the wire was found to be changed, and it broke on the least bending. He had observed somewhat similar changes in the elasticity of metals from the effects of heat. Cast and malleable iron and brass, he had found, did not return to their former dimensions when expanded by heat; thus a diminution of strength was continually going on in metallic bodies, independently of the ordinary decay from atmospheric action.—Mr. HODGKINSON said, the French writers on the subject had made the strength of cast-iron double what it ought to be, owing to their having taken the old standards for their guide.—Mr. PERRY thought the effect of time in destroying the strength of bodies was a subject deserving more consideration.—Mr. Hodgkinson said, he and Mr. Fairbairn had long since given attention to that part of the question. They possessed bars of iron which had been for years with heavy weights resting upon them. The deflexion was gradually, though very slowly, increasing; and no doubt the bars would ultimately break, but many years would probably elapse before that took place. The bars which had been most loaded came to a fixed condition in about fifteen months.

GENERAL COMMITTEE.

TUESDAY.

The Committee assembled at three o'clock; in the absence of the Earl of Rosse the chair was taken by the Rev. Dr. Robinson.

The following Recommendations, involving Grants of Money, were adopted.

Mathematical and Physical Science.

Brewster, Sir D.—For continuing hourly Meteorological Observations at Kingussie and Inverness	£ 12
Harris, W. S.—For completing the Meteorological Observations at Plymouth	35
Robinson, Dr.—For conducting experiments with Captive Balloons	100
Herschel, Sir J.—For Magnetic and Meteorological co-operation	50
Brewster, Sir D.—For investigating the Action of different Bodies on the Spectrum	10
Sabine, Col.—For superintending the Translation and Publication of Scientific Memoirs	20
Baily, Francis, Esq.—For the Publication of the British Association Catalogue of Stars	650
Brisbane, Sir Thomas—For completing the Observations on Tides of the East Coast of Scotland	100
Wheatstone, Professor.—For Experiments on Subterraneous Temperature	30
	£1007

Kew Observatory.

For maintaining the establishment in Kew Observatory	200

Chemical Science.

Kane, Professor—For investigating the Chemical History of Colouring Substances	10
Kane, Professor—For inquiries into the Chemical History of Tannin	10
Fox, R. W. Esq.—For continuing Researches on the Influence of Light on Plants	10
	£ 30

Geological Science.

Oldham, —— Esq.—For experiments on Subterraneous Temperature in Ireland	10
Northampton, Marquis of—For making Coloured Drawings of Railroad Cuttings	100
Owen, Professor—For investigation of Fossil Fishes of the Lower Tertiary Strata	100
Whewell, Rev. W.—For completing Level Marks in Somerset and Devon	20
Milne, David, Esq.—For establishing Standard Level Marks on the Coast of Scotland, with particular reference to the direction of shocks of Earthquakes	20
	£250

Geology and Zoology.

Carpenter, Dr.—For researches into the Microscopic Structure of Fossil and recent Shells	20

Botany and Zoology.

Strickland, H. E. Esq.—For experiments on the Vitality of Seeds	15
Jardine, Sir W. Bart.—For researches on Exotic Anopleura	25
Portlock, Capt.—For a Report on the Marine Zoology of Corfu	10
Daubeny, Dr.—For investigating the Preservation of Animal and Vegetable Substances	10
Owen, Professor—For researches on the Marine Zoology of Cornwall and Devon, by Mr. Peach, and especially the preservation of Radiata and Mollusca	10
Forbes, Professor E.—For researches on the Geographical Distribution of Marine Animals	25
Hodgkin, Dr.—For inquiries into the varieties of the Human Race	15
	£110

Medical Science.

Sharpey, Dr.—For Inquiries into Asphyxia	10

Mechanical Science.

Russell, J. S. Esq.—For completing the discussion of experiments on the Form of Ships	100
Hodgkinson, Eaton, Esq.—For experiments on the Strength of Materials, and on the changes which take place in their internal structure	100
Fairbairn, W. Esq.—For experimental investigations on changes in the internal constitution of Metals, arising from vibration and concussion	50
	£250

Total of Grants	£1877

Recommendations not involving pecuniary Grants.

Section A.

That Sir J. Herschel and Mr. Baily be requested to continue their revision of the nomenclature of Stars.

That the Master-General of the Ordnance be requested to facilitate the experiments on Captive Balloons, undertaken at the expense of the British Association.

That Prof. Bache be requested to proceed with his report on American Meteorology.

That Dr. Lamont's report of the German Meteorological Association, though not yet arrived, be printed in the volume of Transactions.

That the following Reports be requested for the next meeting.

Prof. Airy, on the progress of Astronomy since his former report.—Prof. Wheatstone, on Vision.—Mr. Hodgkinson, on the Resistance of the Atmosphere to moving bodies.—Mr. Kelland, on the Undulations of fluid and elastic bodies.—

Digitized by Google

Mr. Talbot, on Photography.—Mr. Phillips on the colour and structure of Clouds.—Prof. Lloyd, a second report on Physical Optics.

Section B.

That the future title of this Section shall be Chemistry and Mineralogy, with their application to Agriculture and the Arts.

That the papers on Cerium and Lanthanium, by Prof. Mosander, of Stockholm, translated by Major Beamish, be printed at full length in the Transactions.

Section D.

That the Government be requested to give some pecuniary aid for the publication of Prof. Forbes's Researches in the Ægean.

That Dr. Richardson report on our knowledge of Fish in the Chinese seas.

That Mr. Blackwall be requested to complete his account of the Palpi.

That Messrs. Alder and Hancock do report on the Nudibranchiate Mollusca.

Section E.

That Mr. Blake continue his researches into the Physiological Action of Medicine.

Section G.

That Government be requested to have Contour Lines of Elevation added to the maps of the Ordnance Survey.

That Messrs. Fairbairn, Hodgkinson, and Buck continue their researches into the Consumption of Fuel and Smoke.

That a Committee be appointed to examine the report on the Forms of Ships, with a view to its publication.

General Recommendations.

That thanks be voted to the Lord Lieutenant for presenting the Association with a copy of the general Census of Ireland.

That the officers and council of the Association shall join in an application from the citizens of Cork to her Majesty's Government, for restoring the Royal Cork Institution to its former efficiency.

The last recommendation unexpectedly gave rise to a very unpleasant discussion, but it was finally checked by the decision of the chairman, and the motion was carried.

To CORRESPONDENTS.—The *first* Report of the Commissioners of the Fine Arts, with the Appendix, was given last year (Nos. 773. 4). The *second* Report merely records progress, as announced from time to time in this Journal. Mr. Barry's Report to the Commissioners, which accompanies it, and to which we presume our Correspondent refers, was published in this Journal in April last, and will be found *ante*, p. 417.

Errata.—In Mr. Hosking's letter, p. 771, col. 1, 22 lines from bottom, for "compared," read confused.—In Messrs. Brain and Payne's advertisement, p. 762, the price of the vols. of the Conversations Lexikon should have been 6*s.*

NEW VOLUME OF ROSE'S BIOGRAPHICAL DICTIONARY.

Just published, price 18*s.*, Vol. V. of a

NEW GENERAL BIOGRAPHICAL DICTIONARY, projected and partly arranged by the late Rev. HUGH JAMES ROSE, B.D.

Part XX. is also now ready.

Published for the Proprietors, by B. Fellowes, Ludgate-street.

6, New Burlington-street, September 2, 1843.

MR. BENTLEY'S NEW PUBLICATIONS
NOW READY.

I.

In 3 vols. post 8vo.

WYANDOTTE; or, THE HUTTED KNOLL. A Romance.

By J. FENIMORE COOPER, Esq.

Author of 'The Pilot,' 'The Spy,' 'The Jack O'Lantern,' &c.

II.

2 vols. 8vo. with Portraits,

GEORGE SELWYN AND HIS CONTEMPORARIES, with MEMOIRS and NOTES.

By J. HENEAGE JESSE, Esq.

Author of 'Memoirs of the Court of England under the Stuarts,' and 'The Court of England under the Houses of Nassau and Hanover.'

III.

In 2 vols. post 8vo. revised and corrected by the Author,

SECOND EDITION OF

SLICK IN ENGLAND; or, THE ATTACHÉ.

By the Author of 'The Clockmaker; or, Sayings and Doings of Sam Slick of Slickville.'

IV.

Now first published,

2 vols. 8vo. with Portraits from original Paintings, &c.

LETTERS OF HORACE WALPOLE,

EARL OF ORFORD,

TO SIR HORACE MANN, H.B.M. Resident at the Court of Florence, from the year 1760 to 1785.

Printed from the Original MSS.

Concluding Series.

V.

In 3 vols. post 8vo.

THE BUSY BODY; a Novel.

VI.

Hudson's Bay Company.

In 1 vol. 8vo. with Maps by Arrowsmith,

NARRATIVE OF THE DISCOVERIES ON THE NORTH COAST OF AMERICA;

EFFECTED BY THE OFFICERS OF THE HUDSON'S BAY COMPANY, during the Years 1836–39.

By THOMAS SIMPSON, Esq.

VII.

In 3 vols. post 8vo.

THE CIRCASSIAN CHIEF; a Romance of Russia.

By WILLIAM H. G. KINGSTON, Esq.

Richard Bentley, New Burlington-street,

(*Publisher in Ordinary to Her Majesty.*)

Black's Guide-Books
AND TRAVELLING MAPS FOR TOURISTS.

In a closely-printed portable Volume, price 10*s.* 6*d.*

Containing a General Travelling Map, with the Roads and Railways distinctly laid down; Sections of the more important districts on an enlarged scale, and engraved Charts of Roads, Railroads, and Interesting Localities,

BLACK'S

PICTURESQUE TOURIST
AND ROAD-BOOK OF
ENGLAND AND WALES.

Besides a copious Itinerary, with the distances accurately indicated, the volume contains descriptions of the picturesque and interesting scenery in the vicinity of the road, illustrated with numerous Views, engraved in the first style of the art by Miller, Forrest, and Chapman, after Drawings by Montague Stanley, T. M. Richardson, jun., and Sargent.

The volume also contains a Note on the Expenses of Travelling, and on the Gratuities to Servants at Inns and Hotels.

"A carefully-executed work."—*Athenæum.*

In a compactly-printed volume, price 8*s.* 6*d.*

Containing an accurate Travelling Map; Engraved Charts of Roads, Railroads, and Interesting Localities; Plans of Edinburgh and Glasgow; numerous Views of the Scenery on Wood and Steel; and a copious Itinerary,

THE THIRD EDITION OF

BLACK'S

PICTURESQUE TOURIST
OF SCOTLAND.

"A comprehensive, intelligent, and well-arranged Guide-book. We have been furnished with an incidental proof of the remarkable accuracy of the Charts and Descriptions in the personal testimony of a pedestrian, who has traversed a considerable space, book in hand."—*Spectator.*

"Of all the Tour-books and Guide-books addressed to home scenery, this is, in our estimation, the best."—*Atlas.*

In a neat pocket volume, price 5*s.*, with a Map of the Lake District by Sidney Hall; Charts of the Lakes, and Views of the Scenery on Wood and Steel; and an ample Itinerary of all the Routes,

BLACK'S

PICTURESQUE GUIDE TO
THE ENGLISH LAKES.

"This Guide to the Lakes has been compiled upon the same elaborate plan, [as 'The Picturesque Tourist of Scotland,'] governed by the same resolution to spare no cost or trouble to achieve a successful result. It needs no higher commendation. It is a Picturesque Guide in every sense—its descriptions are charmingly written—its intelligence is ample and minute—and its illustrations are admirable specimens of art."—*Atlas.*

Beautifully coloured, in a neat portable case, price 4*s.* 6*d.*

BLACK'S ROAD AND RAILWAY

TRAVELLING MAP OF
SCOTLAND.

Size 33 inches by 23½, carefully constructed from the best authorities, with all the Railroads and other Topographical Information required either by the Tourist or Traveller on Business.

*** From the care bestowed on the construction of the present Map, and the means which have been used to correct the original drawings, by reference to individuals conversant with the Topography of their respective localities, the Publishers are satisfied that this will be found the most accurate and beautiful Map of Scotland extant.

Uniform with the above, price 4*s.* 6*d.*

BLACK'S ROAD AND RAILWAY

TRAVELLING MAP
OF ENGLAND AND WALES.

Carefully constructed from the Maps of the Ordnance Survey, with all the Roads and Railroads accurately laid down.

"A beautifully executed Map of England and Wales, which we have no hesitation in pronouncing one of the most unique that has been brought out for a long time, and which, after careful observation and reference, we can also characterize as being among the most correct ever issued."—*Mining Journal.*

The following smaller Maps, although so moderate in price, are engraved with the same beauty and accuracy as those of larger size, the only difference being, that the larger Maps are necessarily more minute in their information.

Black's Pocket Map of England. 2*s.* 6*d.*
Black's Pocket Map of Scotland. 2*s.* 6*d.*
Black's Pocket Map of Ireland. 2*s.* 6*d.*

In 2 vols. post 8vo. price 21*s.*

Profusely illustrated with Etchings and Woodcuts,

A VOYAGE ROUND THE

COASTS OF SCOTLAND
AND THE ISLES.

By JAMES WILSON, F.R.S.E. M.W.S. &c.

Author of the Treatise on Angling in 'The Rod and the Gun.'

"Two of the most charming volumes we have had under our notice for a long time. They describe scenery round which the imagination loves to linger, and of which no description can be fatiguing."—*Court Journal.*

"Written in a flowing and animated style."—*Edinburgh Review.*

ADAM & CHARLES BLACK, Edinburgh;
Longman & Co. London; and sold by all Booksellers.

THE PHONOTYPIC and PHONOGRAPHIC JOURNAL, No. 21, for SEPTEMBER, price 3*d.* contains:

PHONOTYPIC PART.

The Phonographic Corresponding Society—Remarks on the Orthoepy and Orthography of the English Language—Phonographic Lecture Tablet—Extracts from the Editor's Phonographic Correspondence—Review of Phonography—Phonographic Intelligence—Subscriptions towards a Phonotypic Fount—SUPPLEMENT: On Phonetic Printing.

PHONOGRAPHIC PART (written in the Phonographic Character).

Christian Friendship—Paragraphs—Gems of Wisdom—Alphabetic Words, or Grammalogues, for common use in the Second Style of Phonography—Phonotypic Alphabet, No. 8—Specimen of Phonetic Printing—Phonotypic Alphabet, No. 9. *Corresponding Society:* On Teaching Phonography—Law of Halving Consonants, &c.

PITMAN'S PHONOGRAPHY: a Natural Method of Writing all Languages by Signs that represent the Sounds of the Human Voice. 5th edition, royal 8vo. 2*s.*; Pocket size, roan, gilt, 2*s.*—People's Edition, 8vo. stitched, 1*s.*

Exercises in Phonography. 6*d.*

Bagster & Sons, Paternoster-row, London; and all Booksellers.

NEW BOOKS PUBLISHED DURING THE SEASON.

By Mr. Murray, Albemarle-street.

1. LADY SALE'S JOURNAL.
2. LIEUTENANT EYRE'S NARRATIVE.
3. LETTERS from MADRAS.
4. SCROPE'S DAYS of SALMON FISHING.
5. STEPHENS' TRAVELS in YUCATAN.
6. LADY GROSVENOR'S YACHT VOYAGE.
7. BORROW'S BIBLE in SPAIN.
8. BORROW'S GYPSIES of SPAIN.
9. LORD SYDENHAM'S MEMOIRS.
10. WILKIE'S LIFE, LETTERS, and JOURNALS.
11. FRANCIS HORNER'S MEMOIRS.
12. CAPT. LOCH'S CLOSING CAMPAIGN in CHINA.
13. PARIS'S LETTERS from the PYRENEES.
14. HOOD'S NEW SOUTH WALES.
15. DIEFFENBACH'S NEW ZEALAND.

SUMMERLY'S

The SIXTH MONTHLY PART of

A CYCLOPÆDIA

OF

BIBLICAL LITERATURE.

By JOHN KITTO,

Editor of 'The Pictorial Bible,' &c.

Assisted by various able Scholars and Divines, British, American, and Continental, whose Initials are affixed to their respective Contributions.

The design of the Editor is to produce an Original Work, which, within reasonable limits, and at a moderate price, shall present a comprehensive digest of all the information considered necessary in a Dictionary of this description, and embracing the results of those modern researches in Biblical Literature and Science, with which it is so important that English readers should be acquainted.

The Work is printed in double columns, in a clear and distinct type, and is embellished with highly-finished Engravings on Steel, and with Maps. The volume is also profusely illustrated with Wood-engravings, representing Landscapes, Buildings, Monuments, Plants, Animals, Illustrations of Manners and Customs, and whatever can be more clearly displayed by *pictorial* than by *written* description, or by which the written text may be in any degree elucidated.

The following List of Contributors will enable the public to judge of the distinguished co-operation by which the Editor is aided in conducting the Work:—

Rev. W. L. ALEXANDER, M.A., Author of 'The Connexion and Harmony of the Old and New Testaments,' &c.
Rev. J. R. BEARD, D.D., Member of the Historico-Theologico Society of Leipzig.
Rev. C. H. F. BIALLOBLOTSKY, Ph. D., of Göttingen, Author of 'De Abrogatione Legis.'
G. M. BELL, Author of 'Universal Mechanism,' &c.
Rev. JOHN BROWN, D.D., Professor of Exegetical Theology to the United Secession Church.
Rev. GEORGE BUSH, Professor of Hebrew and Oriental Literature in the University of New York.
Rev. K. A. CREDNER, Ph. D., Professor of Theology in the University of Giessen.
Rev. S. DAVIDSON, L.L.D., Professor of Biblical Literature and Oriental Languages in the Lancashire Independent College.
Rev. J. F. DENHAM, M.A., St. John's Coll. Cambridge, F.R.S.
Rev. J. W. DORAN, L.L.D., Association Secretary of the Church Missionary Society.
Rev. J. W. GOTCH, M.A., Trinity College, Dublin.
Rev. H. A. C. HAVERNICK, Ph. D., Professor of Theology in the University of Königsberg.
Rev. E. W. HENGSTENBERG, D.D., Professor of Theology in the University of Berlin.
Rev. J. JACOBI, of the University of Berlin.
Rev. R. JAMIESON, M.A., Editor of 'Paxton's Illustrations of Scripture.'
E. MICHAELSON, Ph. D.
Rev. N. MORREN, M.A., Author of 'Biblical Theology,' and Translator of 'Rosenmüller's Biblical Geography.'
JOHN NICHOLSON, B.A., Oxford, Ph. D. Tübingen, Author of 'An Account of the Establishment of the Fatemite Dynasty,' Translator of 'Ewald's Hebrew Grammar.'
W. A. NICHOLSON, M.D.
F. W. NEWMAN, late Fellow of Balliol College, Oxford.
Rev. JOHN PHILLIPS POTTER, M.A., Oriel College, Oxford.
Rev. BADEN POWELL, M.A. F.R.S. F.G.S., Savilian Professor of Geometry in the University of Oxford.
FREDERICK R. LEES, Ph. D., Author of 'Illustrated History of Alcohol.'
J. F. ROYLE, M.D. F.R.S. F.L.S. F.G.S., Member of the Royal Asiatic Societies of Calcutta and London; Professor of Materia Medica and Therapeutics in King's College, London.
J. E. RYLAND, Translator of 'Neander's Church History.'
Lieut.-Col. C. HAMILTON SMITH, K.H., and K.W. F.R. and L.S., President of the Devon and Cornwall Natural History Society, &c. &c.
Rev. J. PYE SMITH, D.D. F.R.S. F.G.S.
Rev. H. STEBBING, D.D., Author of 'A History of the Church,' &c.
Rev. A. THOLUCK, D.D., Professor of Theology in the University of Halle.
Rev. WILLIAM WRIGHT, L.L.D., Trin. Coll. Dublin, Translator of 'Seiler's Biblical Hermeneutics.'

ADAM & CHARLES BLACK, Edinburgh;

LONGMAN & Co.; SIMPKIN, MARSHALL & Co.; WHITTAKER & Co.; and HAMILTON, ADAMS & Co., London.

THE ART-UNION MONTHLY JOURNAL.—No. 57 of this Journal contains various details concerning Barry's Plan for Embellishing the New Houses of Parliament with Statues, Paintings, and other Works of Art; illustrated by Engravings of the Interior, and a Ground Plan. Together with a variety of Articles interesting and important to the Artist, the Amateur, and the Public generally. Price 1*s.* Office, 132, Fleet-street.

FREEMASONS' and GENERAL LIFE ASSURANCE COMPANY, 11, Waterloo-place, Pall Mall, London.

Business transacted in all the branches and for all objects of LIFE ASSURANCE, ENDOWMENTS and ANNUITIES, and to secure CONTINGENT REVERSIONS, &c. Loans granted. Information and Prospectuses furnished by

JOSEPH BERRIDGE, Secretary.

ECONOMIC LIFE ASSURANCE SOCIETY, No. 34, Bridge-street, Blackfriars, London: established 1823. Empowered by Act of Parliament, 3 William IV.

Lower Rates of Premium than those of any other office that entitle the assured to participate in the profits.

The bonus declared in 1834 amounted upon an average to 16*l.* per cent. on the premiums then paid; and in 1839 a second bonus was awarded, amounting on the average to 31*l.* per cent. on the premiums paid during the preceding five years.

Prospectuses and other particulars may be obtained at the Office, between the hours of ten and four, or will be forwarded to persons resident in the country, on application.

CAMPBELL JAMES DOWNER, Sec.

ANNUITIES.—In the AUSTRALASIAN COLONIAL AND GENERAL LIFE ASSURANCE AND ANNUITY COMPANY, Annuitants *participate in the profits of the Company*, and receive a rate of ANNUITY much more favourable than can be granted by any Company making its investments wholly in England. The Company is enabled securely to grant these favourable terms from the advantage it possesses of investing a portion of its funds at a high rate of interest.

Directors.

Edward Barnard, Esq. F.R.S.
Henry Buckle, Esq.
John Henry Capper, Esq.
Gideon Colquhoun, Esq.
C. E. Mangles, Esq.
J. B. Montefiore, Esq.
Richard Onslow, Esq.
William Walker, Esq.

Bankers—The Union Bank of London.

Colonial Bankers—The Bank of Australasia, (incorporated by Royal Charter, 1835,) No. 2, Moorgate-street.

Solicitors—Messrs. Swain, Stevens & Co.

Prospectuses, with Tables, Forms of Proposal for the purchase of an Annuity or for making an Assurance, and every information, may be obtained by application at the Office of the Company, No. 126, Bishopsgate-street, City.

EDWARD RYLEY, Sec.

WESTERN LIFE ASSURANCE SOCIETY, 49, Parliament-street, Westminster.—Capital 500,000*l.*

Directors.

Henry Edgeworth Bicknell, Esq.
William Cabel, Esq.
Thos. Somers Cocks, jun. Esq.
George Henry Drew, Esq.
William Evans, Esq.
William Freeman, Esq.
Francis Fuller, Esq.
James Hunt, Esq.
John Arscott Lethbridge, Esq.
Edmund Lucas, Esq.
George Kennet Pollock, Esq.
James Lys Seager, Esq.
John Bazley White, Esq.
Joseph Carter Wood, Esq.
Henry Wrench, Esq.

Physician—William Richard Basham, M.D.

Surgeons—Alfred Leggatt, Esq.; George D. Pollock, Esq.

Bankers—Messrs. Cocks, Biddulph & Co.

Solicitors—Messrs. J. L. Bicknell and J. C. Lethbridge.

The leading features of this Society are—

The very moderate Rate of Premium when viewed as combined with *perfect security* to the assured.

The advantage to the Assurers (by Table 2) of becoming entitled to *three-fourths* of the *profits*.

The assurance of a *certain bonus*.

The facility for *securing debts*.

The allowance of *half* the Annual Premium to remain unpaid for *seven years*, and

The accommodation of *temporary loans* to the Assured on available security. Immediate and deferred Annuities are granted by this Society on terms advantageous to the Public.

A liberal Commission allowed to Professional Gentlemen and Agents introducing business to the Office.

EDWARD T. RICHARDSON, Secretary.

Digitized by Google

NATIONAL LOAN FUND LIFE ASSURANCE, ANNUITY, and DEFERRED ANNUITY SOCIETY, 26, Cornhill, London.—Capital, 500,000*l.*—Empowered by Parliament.

Directors—T. LAMIE MURRAY, Esq. *Chairman.*

John Elliotson, M.D. F.R.S.	George Lungley, Esq.
John Griffith Frith, Esq.	John Rawson, Esq.
H. Gordon, Esq.	Clement Tabor, Esq.

Joseph Thompson, Esq.

Auditors—Prof. Wheatstone, F.R.S.; Prof. Graves, A.M. F.R.S.
Actuary—W. S. B. Woolhouse, Esq. F.R.A.S.

The superior advantages to those Assured with this Society will be best understood by a comparison of its principles and a reference to the last Annual Bonus declared on Policies of five years' standing, viz.:

Entry	Policy No.	Age	Sum	Annual Premium.	Bonus added.	Cash Bonus.	Premium reduced.
			£	£ s. d.	£ s. d.	£ s. d.	£ s. d.
1837	39	59	1000	67 8 4	132 14 6	58 19 9	8 19 4
1838	114	56	3000	175 15 0	296 9 7	133 0 6	16 9 7

Policies now entered upon entitled to participation in next Annual Division. Two-thirds of all premiums paid can be borrowed by the assured without loss of Policy.

F. FERGUSON CAMROUX, Secretary.

BRITANNIA LIFE ASSURANCE COMPANY, 1, Princes-street, Bank, London.

This Institution is empowered by *Special Act of Parliament*, (4 Vict. cap. 9), and is so constituted as to afford the benefits of Life Assurance in their fullest extent to Policy-Holders, and to present greater facilities and accommodation than are usually offered by other Companies. The decided superiority of its plan, and its claim to public preference and support, have been proved incontestibly, by its extraordinary and unprecedented success.

Assurances may either be effected by Parties on their own Lives, or by Parties interested therein on the Lives of others.

The effect of an Assurance on a person's own life is to create at once a property in reversion, which can by no other means be realized. Take, for instance, the case of a person at the age of thirty, who by the payment of 5*l.* 3*s.* 4*d.* to the Britannia Life Assurance Company, can become at once possessed of a bequeathable property, amounting to 1000*l.*, subject only to the condition of his continuing the same payment quarterly during the remainder of his life,—a condition which may be fulfilled by the mere saving of EIGHT SHILLINGS weekly in his expenditure. Thus, by the exertion of a very slight degree of economy —such, indeed, as can scarcely be felt as an inconvenience, he may at once realize a capital of 1000*l.*, which he can bequeath or dispose of in any way he may think proper.

Detailed Prospectuses, and every requisite information as to the mode of effecting Assurances, may be obtained at the Office.

PETER MORRISON, Resident Director.

A Board of Directors attend daily at 2 o'clock, for the dispatch of business.

MUTUAL ASSURANCE. SCOTTISH (WIDOWS' FUND) LIFE ASSURANCE, Founded A.D. 1815. Constituted by Act of Parliament.

HEAD OFFICE, EDINBURGH, 5, ST. ANDREW-SQUARE.
Capital accumulated and invested, upwards of ONE MILLION THREE HUNDRED THOUSAND POUNDS. Annual Revenue upwards of TWO HUNDRED THOUSAND POUNDS.

President—The Right Hon. the Earl of Rosebery, K.T.

Vice-Presidents.

The Marquis of Tweeddale, K.T.	The Hon. Lord Moncreiff
Sir Thomas Dick Lauder, Bart.	His Grace the Duke of Buccleuch, K.G.

The rules for the distribution of the Surplus Funds or Profits in this Society are framed on the most equitable principles; the Assured participating therein according to the amount and endurance of their respective Policies. By the laws of the Society, regulating the distribution of the Surplus Funds, Additions fall to be made to the Policies at each period of investigation, in proportion to the amount assured, and the number of annual premiums previously paid: and a Contingent Prospective Addition is also declared, to meet the case of persons dying between two periods of investigation, such Contingent Prospective Addition being calculated in proportion to the number of annual premiums paid, during the interval, not only on the Sum Assured, but also on the VESTED ADDITIONS previously declared. Parties dying within five years after the date of their Assurances receive no Additions, any order previously made for Additions to such Policies becoming thereby vacated; but in the event of the parties *surviving* the period of five years, the Additions *previously* declared *take full effect from the date of the Policy.*

The next Periodical Investigation takes place on 1st January, 1846.

Amount of Capital Sums insured since the commencement of the Society, is nearly SIX MILLIONS STERLING. Whole profits belong to the assured, and are divisible septennially.

JOHN MACKENZIE, Manager.

LONDON OFFICE, 7, Pall Mall,
HUGH M'KEAN, Agent.

ARGUS LIFE ASSURANCE COMPANY, 39, Throgmorton-street, Bank.

Empowered by special Act of Parliament, 5 & 6 Will. IV. c. 76.

Thomas Farncomb, Esq. Alderman, *Chairman.*
William Leaf, Esq. *Deputy-Chairman.*

William Banbury, Esq.	Rupert Ingleby, Esq.
Edward Bates, Esq.	Thomas Kelly, Esq. Ald.
Thomas Camplin, Esq.	Jeremiah Pilcher, Esq. Sheriff
James Clift, Esq.	of London and Middlesex
Rt. Hon. J. Humphery, M.P. Lord Mayor of London	Lewis Pocock, Esq.

Physician—Dr. Jeaffreson, 2, Finsbury-square.
Surgeon—W. Coulson, Esq. 2, Frederick's-place, Old Jewry.
Consulting Actuary—Professor Hall, of King's College.

Advantages of the Argus Life Assurance Company.
Low Rates of Premiums.

In addition to the subscribed Capital of 300,000*l.* the assured have the security of the Company's Income of nearly 60,000*l.* per annum, yearly increasing, and accumulating Assurance Fund invested in Government and other available Securities, of considerably larger amount than the estimated liabilities of the Company.

The Rates of Premium are reduced to the lowest scale compatible with the safety of the Assured and the stability of the Company, thereby, in effect, giving to every policy-holder an immediate and certain bonus without risk, in lieu of the deferred and frequently delusive prospect of a periodical division of profits.

Annual Premium to Assure £100.

Age.	For One Year.	For Seven Years.	Whole Term.
20	£0 17 8	£0 19 1	£1 11 10
30	1 1 8	1 2 7	2 0 7
40	1 5 0	1 6 9	2 14 10
50	1 14 1	1 19 10	4 0 11
60	3 2 4	3 17 0	6 0 10

One-third of whole-term Premiums may remain unpaid at 5 per cent. comp. int. as a debt upon the Policy for life, or may be paid off at any time without notice.

In Assurances for advances of money, as security for debts, or as a provision for a family, when the least present outlay is desirable, the varied and comprehensive Tables of the Argus Office will be found to be particularly favourable to the assured.

A Board of Directors, with the Medical Officers, attend daily, at a quarter before 2 o'clock.

EDWARD BATES, Resident Director.

A Liberal Commission to Solicitors and Agents.

VICTORIA LIFE ASSURANCE COMPANY.

Trustees.

Sir Jas. Duke, Ald. M.P. *Chairman*	Benj. Hawes, Esq. *Dep. Chairman*
Benj. Barnard, Esq.	Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus:—

Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.

Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.

Assurances may be effected *with* or *without* profits—on an ascending or descending scale, or for short periods.

Advances made to Assurers on real or undoubted personal security, for terms not exceeding three years, repayable by instalments.

Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary. WILLIAM RATRAY, Actuary and Secretary.

THE WESTMINSTER and GENERAL LIFE ASSURANCE ASSOCIATION,

At the WESTMINSTER FIRE OFFICE,
No. 27, King-street, Covent-garden.

Trustees—G. Dodd, Esq. M.P.	George Mercer, Esq.

William B. France, Esq.	John Sturges, Esq.
Richard Halliwell, Esq.	J. W. Thrupp, Esq.
Charles William Knight, Esq.	Howell Leny Vallotton, Esq.
Charles Mayhew, Esq.	John White, Esq.

Auditors.

John Chas. Burgoyne, Esq.	James Tilbury, Esq.
The Rev. Geo. Fisher, F.R.S.	John Walls, Esq.

Physician—Charles J. Roberts, M.D., 31, New Bridge-street, Blackfriars.
Surgeon—James M. Arnott, Esq. 2, New Burlington-street.
Solicitor—Thomas Burgoyne, Esq. 160, Oxford-street.
Bankers—Messrs. Cocks, Biddulph & Co. 43, Charing-cross.

A DIVIDEND OF THE PROFITS OF THIS SOCIETY WAS DECLARED ON THE 1ST JANUARY, 1842, by which an addition, amounting on the average to 45 PER CENT. on the Premiums received was made to all Policies entitled to share therein.

FOUR-FIFTHS, or 80 PER CENT. of the total profits, are divided among the Assured at intervals of five years; and all Policies on which two payments have been made, participate in the division.

The Profits respectively allotted may be received by the Assured in present money, by a reduction of the Annual Premium, or by adding to the Policy an equivalent reversionary sum.

All Persons Assured on their own lives for 1,000*l.* or upwards, have the right (after two Annual payments) to attend and vote at the General Meetings of the Society.

W. M. BROWNE, Actuary.

GROWTH OF PLANTS.

HUMPHREYS'S COMPOUND to Promote the Beauty and Preservation of Plants, may be used either in the Drawing-room or in the Conservatory, and, from its condensed, fertilizing power, a few grains dissolved in water at intervals is effective. Applicable to all Greenhouse Plants; to Hyacinths, and other bulbs; and to promote the growth of cuttings and the germination of seeds.—Sold in bottles, 1*s.* 9*d.* each, by all the leading Chemists and Seedsmen in Town and Country. Wholesale Agents, DAVY, MACKMURDO & Co. 100, Upper Thames-street, London.

STONE-COLOURED CEMENT.

FELIX AUSTIN, of the New Road, Regent's Park, begs to inform Architects, Builders, Plasterers, &c. that during the process of manufacturing a very superior composition which has greatly improved his well-known Artificial Stone Ornaments, he has succeeded in making an excellent STONE-COLOURED CEMENT, adapted to building, more especially for facing brick walls and repairing decayed stone work, which he can supply at 2*s.* 6*d.* per bushel, at his Manufactory, near the Thames Tunnel, Rotherhithe.

THE OMBROSOME, or PATENT PORTABLE SHOWER BATH, especially adapted for travelling and exportation. By this Bath an inexhaustible shower is produced from a few quarts of water: the height of the shower may be increased or lessened to suit adults or children, and occupying so little room, is peculiarly suited for bed-rooms and dressing-rooms; it is also an excellent Douche Bath. Being little larger than a writing-desk when packed, it will be a great desideratum for exportation to India and other hot climates. To Military Men and others of a migratory life, also to Students of the Universities, Inns of Court, &c. (where rooms are low and water scarce), the present invention cannot fail to be most acceptable. It is made entirely of brass, and is at once simple and elegant.—May be seen at the Royal Polytechnic Institution; and be had, with Prospectuses, at the Bazaar, Panklibanon Iron Works, 58, Baker-street; Mr. J. L. Benham, 19, Wigmore-street; Mr. C. Bray, 16, Cranbourne-street; Mr. J. Deacon, 4, Moorgate-street; Mr. J. Evans, London Bridge, and Ludgate-hill; Messrs. Fallows & Adcock, 4, Halkin-street West; Messrs. Glenton & Chapman, 147, New Bond-street; and may shortly be had of all the leading Ironmongers throughout England.

Price 4*l.* 10*s.* and 5*l.* 5*s.*

BUTTER MADE IN TEN MINUTES, by the NEWLY-INVENTED CHURN, registered according to Act of Parliament.

ATTWOOD, WIMBLE & WARNER, Manufacturers, LEWES, Sussex.

This CHURN being made entirely of Block Tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which insures the butter coming in ten or twelve minutes. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use.

Sizes,	No. 1,	2,	and 3,
Churn from	7 to 8 lbs.	13 to 15 lbs.	26 to 28 lbs.
Price, carriage paid to London,	25*s.*	35*s.*	42*s.*

Metal Pans for Churns to stand in, 4*s.* 6*d.*, 6*s.*, and 7*s.* Larger sizes made to order. N.B. Thermometers and Butter Prints supplied. May be obtained through any respectable ironmonger in Town or Country, and from the Manufacturer, Lewes.

To be seen in London, at Wright's Range Warehouse, No. 3, Arthur-street, near the Monument; W. Baily & Son, Furnishing Ironmongers, 71, Gracechurch-street; Livermore & Son, Ironmongers, No. 30, Oxford-street; Benham, 19, Wigmore-street, Cavendish-square. Export Agents, Barnes & Co., 109, Fenchurch-street.

LEA & PERRIN'S 'WORCESTERSHIRE SAUCE.' Prepared from the Recipe of a Nobleman in the County.—The above celebrated Sauce has, from the time of its introduction, been steadily progressing in public favour. Its peculiar piquancy, combined with exquisite flavour, establish it of a character unequalled in sauces. Noblemen and others, of acknowledged goût, pronounce it to be 'the only good sauce;' and for enriching gravies, or as a zest for fish, curries, steaks, game, cold meat, &c., especially unrivalled. As a rapidly-increasing inquiry is now made for it in all parts of the kingdom, the Proprietors beg to state that druggists, grocers, and others may be supplied by their agents—Messrs. Barclay & Sons, Farringdon-street; Mr. J. Harding, 59, King-street, Stepney; Messrs. Metcalfe & Co. 16, Southampton-row; and by the Wholesale Oil and Italian Warehousemen in London, upon the same terms as at their Warehouse at Worcester.—Sold retail, in half-pint bottles, at 1*s.* 6*d.*; pints, 2*s.* 6*d.*; and quarts, 5*s.* each, with the Proprietors' stamp over the cork of every bottle.

OLD GILDING, LACKER, and BRONZE, however dirty, faded, or tarnished, rendered equal to new by UPTON'S PARISIAN DETERGENTS. The effect is sudden, astonishing, and lasting; trouble merely sponging the surface, and the expense only a few pence for the largest gilt frame, and the merest trifle for lackered articles. Fly spots are at once removed from gilding; no necessity, therefore, to cover from the fly. Gold detergent, 2*s.* 6*d.* per bottle; lacker and bronze, 1*s.* 6*d.*; lamp, 1*s.* 4*d.* All are innoxious and inoffensive. Sold by Upton & Co., Lamp-manufacturers, 33, George-street, Hanover-square, and 65, Basinghall-street, City. Established nearly 40 years. A trial allowed free of all charge. Trade supplied.

ELECTRO-PLATED and GILT ARTICLES.—ELKINGTON & CO., Patentees, beg to announce that, to meet the increasing demand for this manufacture, they have opened an Establishment at No. 22, REGENT-STREET, (CORNER of JERMYN-STREET,) where every variety of articles for the Side-board, Dinner, Dessert, and Breakfast Tables may be inspected.

They have also a similar assortment at their City Establishment, No. 45, MOORGATE-STREET, where they have a MANUFACTORY for PLATING and GILDING, RE-PLATING and RE-GILDING ARTICLES of every description, and of ALL METALS.

With reference to articles of their manufacture, the Patentees beg to state that they differ from all goods hitherto offered as "Plated Goods" or "Substitutes for Silver," being made in the same manner as SOLID SILVER, from which they cannot be known, and being also composed of a hard white metal, strongly coated with silver by the Electro process.

Silver Articles of every kind or pattern exactly copied.

Every article made by the Patentees bears their stamp (E. & Co. beneath a Crown.)

MOULD CANDLES to BURN WITHOUT SNUFFING.—KEMPTON'S PATENT.—These candles do not require snuffing; they burn longer and are cheaper than any other candle; the flame is steady and brilliant. No metallic or deleterious matter is used in the manufacture. Price 8*d.* per lb. Sold by G. E. Parish, agent for exportation, 91½, Bread-street, City, and by Slodden & Stocking, 42, High-street, Marylebone; W. Gethem, Broadley-terrace, Blandford-square; W. Evans, Italian warehouse, Greenwich; John Hawkins, grocer, High-street, Shadwell; George Hawley, grocer, Pitfield-street, Hoxton; S. Game, Fish-street-hill; J. Pain, grocer, Bethnal-green-road; G. H. Hudson, 229, Blackfriars-road; C. H. Nicholas, 19, Bolingbroke-row, Walworth; and at the manufactory, Old Bargehouse, Christchurch, Surrey.

WATCHES by WEBSTER & SON, Chronometer Makers to the Lords of the Admiralty (Established 132 years), 3, BIRCHIN-LANE. The largest assortment of fine Second-hand Watches of any house in London, by the most eminent makers—many nearly equal to new, and at little above half their original cost, all of which W. & Son warrant. They consist of fine Repeaters, Duplex, Lever, and Horizontal Escapements, all of superior manufacture. New Watches of the most elegant patterns upon the principle of their Chronometers, to which the Government awarded the prizes three years in succession, with compensation balances to counteract the variations *of temperature. Also a large* assortment of Lever and elegant Horizontal Watches, for Ladies and Gentlemen, at considerably reduced prices. Old Watches taken in exchange. The most experienced workmen are employed on the premises in the repairing department.

Webster & Son, 3, Birchin-lane, Cornhill.

COMPOSITION FOR WRITING WITH STEEL PENS.
STEPHENS' WRITING FLUID.

THESE COMPOSITIONS, which have so remarkably extended the use of the STEEL PEN, are brought to very great perfection, being more easy to write with, more durable, and in every respect preferable to the ordinary ink. In warm climates they have become essential. They consist of—AN INSTANTANEOUS BLACK INK—A BLUE FLUID, changing to an intense Black colour—PATENT UNCHANGEABLE BLUE FLUIDS, remaining a deep Blue colour —A SUPERIOR BLACK INK, of the common character, but more fluid—A SUPERIOR CARMINE RED for Contrast Writing —A CARBONACEOUS RECORD INK, unchangeable by any Chemical Agent—Also, a new kind of MARKING INK for Linen; and Inkholders adapted for preserving Ink from Evaporation and Dust. Bottles at 3*d.* each, convenient for writing from, are prepared, which will enable those who may wish to try either of these articles to do so at a small expense. Prepared by HENRY STEPHENS, the Inventor, 54, Stamford-street, Blackfriars-road, London; and sold by Stationers and Booksellers.—N.B. These unchangeable Blue Fluids are Patent Articles; the public are therefore cautioned against imitations, which are infringements; to sell or use which is illegal.

STEPHENS' SELECT STEEL PENS.—The utmost possible care having been bestowed upon the manufacture of these articles so as to procure the highest finish, they can be confidently recommended both for flexibility and durability.

FOR BEAUTIFYING THE SKIN.—GODFREY'S EXTRACT of ELDER FLOWERS, a most fragrant perfume, and delightful cosmetic. It speedily and completely removes tan, redness, &c., and by its cooling, balsamic, and healing qualities, renders the skin soft, pliable, and free from dryness, scurf, &c., and clears it from every humour, pimple, or eruption. By its use the skin becomes, and continues, delicately clear and soft, and the complexion fair and beautiful. In shaving, it is invaluable, rendering the skin smooth and firm, and protects it from the effects of sun and dust. It is beyond all praise as a general family lotion. Sold in bottles, price 2*s.* 9*d.*, by all respectable Medicine Venders and Perfumers.

FOR GOUT, RHEUMATISM, AND RHEUMATIC GOUT.

SIMCO'S GOUT and RHEUMATIC PILLS are a certain and safe remedy; they restore tranquillity to the nerves, give tone to the stomach and strength to the whole system. No other medicine can be compared to these excellent pills, as they prevent the disorder from attacking the Stomach or Head, and have restored thousands from pain and misery to health and comfort. Sold by A. Willoughby & Co., late B. G. Windus, 61, Bishopsgate Without, and nearly all Medicine Venders, at 1*s.* 1½*d.* or 2*s.* 9*d.* per box.

A. & C. Black, Edinburgh; Longman & Co. London.

IMPORTANT HISTORICAL WORK.
Messrs. Wiley & Putnam beg to announce they will have ready for publication, in a few days, in 1 vol. 8vo.
THE DESPATCHES OF HERNANDO CORTES, the Conqueror of Mexico, ADDRESSED TO THE EMPEROR CHARLES V.
Written during the Conquest, and containing a Narrative of its Events.
Now first translated into English from the original Spanish, with an Introduction and Notes,
By GEORGE FOLSOM,
One of the Secretaries of the New York Historical Society, Member of the American Antiquarian Society, Of the Archæological Society of Athens, &c.
"This stirring narrative of toil and adventure, addressed by the celebrated conqueror of Mexico to his Sovereign, although replete with the most romantic interest, has hitherto escaped an English translator. Written amidst the very scenes described, in a tone of honest sincerity, and with a scrupulous attention to truth, these 'Letters or Despatches, after being published separately as they were received in Spain, seem to have been overlooked and forgotten, when in the lapse of time the original editions had disappeared from the public eye."—*Extract from the Preface.*
American Literary Agency, Stationers'-hall-court.
August 30, 1843.

MESMERIC SLEEP.
Just published, in small 8vo. price 5s.
NEURYPNOLOGY; or, The Rationale of Nervous Sleep, considered in relation with Animal Magnetism; illustrated by numerous Cases of its Successful Application in the Relief and Cure of Disease.
By JAMES BRAID, M.R.C.S. Edin. C.M.W.S. &c.
"Unlimited scepticism is equally the child of imbecility as implicit credulity."—*Dugald Stewart.*
"It deserves to be studied and carefully examined by every member of the medical profession, and by every man having the slightest pretensions to a knowledge of natural science, or the laws by which mind and matter reciprocally act and react on each other. He has conferred an incalculable benefit on the public by explaining so clearly the Rationale of Nervous Sleep."—*Edinburgh Evening Post.*
"Here is a splendid benefit opened up to the view of mankind. We recommend Mr. Braid's book to the public."—*Scotsman.*
John Churchill, London; A. & C. Black, Edinburgh.

SUPERIOR SCHOOL BOOKS.
BUTTER'S ETYMOLOGICAL SPELLING-BOOK, and EXPOSITOR; an Introduction to the Spelling, Pronunciation, and Derivation of the English Language. 65th edition. 1s. 6d. bound.
2. Butter's Gradations in Reading and Spelling, upon an entirely new and original plan, by which dissyllables are rendered as easy as monosyllables; with numerous entertaining and instructive Reading Lessons in prose and verse. 25th edition. 1s. 6d.
3. Butter's Gradual Primer. 17th edition. 6d.
Simpkin, Marshall & Co.; Whittaker & Co.; Longman & Co.; Hamilton & Co., London; Oliver & Boyd, Edinburgh.

BUTTER'S TANGIBLE ARITHMETIC and GEOMETRY; an easy and effectual Method of teaching the simple Rules of Arithmetic and Fractions; also the Formation of Squares, Cubes, Prisms, Pyramids, and an endless variety of Buildings; illustrated by Figures, and a box of Cubes, forming a Permanent Fund of Amusement and Instruction. Price, with 96 Cedar Cubes, 5s.; with 144 ditto, 6s. 6d.; with 144 larger Mahogany Cubes, 10s.
Butter's Dissected Trinomial Cube: an elegant Mathematical Illustration and interesting Puzzle; consisting of 27 pieces, of 10 sizes, with which may be formed a variety of Binomial and other Cubes, Trinomial and Binomial Squares, Prisms, and other Figures; with Description and Explanation, in a box. Price 3s.; large size, 7s. 6d.
Sold by all Booksellers, Stationers, and Toymen. J. Trimen, Agent, 11, Portugal-street, Lincoln's-inn.

IV. WAVERLEY NOVELS, PEOPLE'S EDITION, No. 88, and Part XXII. are published.
Also,
BRIDE OF LAMMERMOOR, complete, price 1s. 4d.
Robert Cadell, Edinburgh; Houlston & Stoneman, London.

THE YOUNG MOTHER.
In 12mo. price 6s. cloth, a New Edition of
A GRANDMOTHER'S ADVICE to YOUNG MOTHERS, on the Physical Education of Children.
By M. J. late Countess of MOUNTCASHELL.
London: Robert Baldwin, 47, Paternoster-row.
*** "This book is the production of many years' experience, and much reflection; and the Author trusts that it will be of use to those for whom it is designed—the anxious mother, the attentive governess, and the careful nurse."—*Preface.*

In 12mo. price 5s. cloth lettered,
GUIDE TO THE CONSERVATORY; being a concise Treatise on the Management of the Hothouse and Greenhouse; the Forcing of Bulbs, Shrubs, &c.; and the best mode of keeping a succession of Bloom through every month of the year; exemplified in a select list of the most admirable plants of the present day, under the arrangements both of Jussieu and Linnæus—including their native country, propagation, and the soil adapted to each.
By RICHARD BAINBRIDGE,
Flower Gardener to the Right Hon. Lord Wenlock.
From Notes of the Author's daily practice, and communications furnished by liberal eminent Floriculturists.
*** The peculiar characteristic of this work is the means of obtaining a constant and large supply of flowers. It includes a very extensive list of Orchidaceæ, with their cultivation as pursued by the most eminent practitioners.
London: Robert Baldwin, 47, Paternoster-row.

FRENCH GRAMMAR FOR PRIVATE TUITION.
In 8vo, price 12s. in cloth, the Eighth Edition, of
A GUIDE to the FRENCH LANGUAGE, especially devised for persons who wish to study the Elements of that Language without the assistance of a Teacher.
By J. J. P. LE BRETHON.
London: Robert Baldwin, 47, Paternoster-row.
A Key to the Exercises in the above Work, by means of which any person of a mature understanding may acquire the elements of the French Language practically, as surely as if a professed Teacher were sitting by his side; and, with a very superficial knowledge of it may teach it to others. Directions are given in the Key to parents not accustomed to teach languages, who wish to instruct their children, with the assistance of this book, how they must proceed. Price 8s.

The Fourth Edition, in 12mo. price 5s. bound,
A PRACTICAL SYSTEM OF ALGEBRA, designed for the use of Schools and Private Tuition.
By PETER NICHOLSON and J. ROWBOTHAM.
*** In this edition the authors have not only introduced some important original matter, particularly on proportion, imaginary quantities, binomial theorem, series, &c., but have also endeavoured to illustrate many parts of the work by such alterations as will make it still more acceptable to the public.
London: printed for Robert Baldwin, 47, Paternoster-row.
Also, price 8s. bound,
A Key to the above Work, containing the Solutions of more than 900 problems, by use of which, and the Algebra, a person may acquire a knowledge of this valuable science without the assistance of a Master.

NAVIGATION AND NAUTICAL ASTRONOMY.
The Fourth Edition, corrected, in a large vol. 8vo. price 10s. 6d. boards, or 12s. bound,
A TREATISE ON NAVIGATION AND NAUTICAL ASTRONOMY, adapted to the purposes of Elementary Instruction; with an extensive series of Examples for Exercise, and all the Tables requisite for Nautical Computations; with Rules and Examples adapted to the 'Nautical Almanac' in its new and improved form.
By EDWARD RIDDLE, F.R.A.S.,
Master of the Nautical School, Greenwich Hospital.
London: Robert Baldwin, 47, Paternoster-row.
Also, extracted from the above work, price only 2s. 6d.
Tables of the Logarithms of Numbers, and of Sines, Tangents, and Secants, to six places of decimals.

Adapted for Schools, Private Teachers, and Students.
COOLEY'S ELEMENTS of EUCLID, with explanatory Appendix and Exercises. 4s. 6d. bd.
"The best edition of the Elements which has yet appeared."—*Athenæum.*—"This neat edition of Euclid's Elements is a great improvement on Simson's and Playfair's."—*Scholastic Journal.*—"The editor has done all that could be done to make Euclid easy to beginners."—*Cambridge Chronicle.*
COOLEY'S GEOMETRICAL PROPOSITIONS: a Key to the Exercises appended to the Elements. 3s. 6d. bd.
COOLEY'S FIGURES of EUCLID, with Enunciations, 1s. 6d.
London: Whittaker & Co.: sold by all Booksellers.

Now ready, price 4s. 6d.
RURAL CHEMISTRY.
By EDWARD SOLLY, Esq. Jun., F.R.S.
Experimental Chemist to the Horticultural Society of London, Hon. Mem. of the Royal Agricultural Society, and Lecturer on Chemistry, at the Royal Institution, &c. &c.
Extracts from the Introduction:—
"A knowledge of the chemical composition of soils and the various substances employed as manures enables us to comprehend the mode in which the latter act; and a knowledge of the nature of those substances which plants require, points out the best and most economical methods of restoring to the soil, by manures, those substances which plants remove from it."
"If the farmer knows what it is that gives the fertilising powers to manure, and is aware of the nature of those substances, he will soon learn the best method of preserving and using them: he will then understand how to make the most of the various sources of manure at his disposal, and he will be enabled readily to save much, that, for the want of such knowledge, would otherwise be lost."
London: 3, Charles-street, Covent-garden; and may be ordered of all Booksellers.

MRS. GORE'S NEW NOVEL.
Now ready, at all the Libraries, in 3 vols.
THE BANKER'S WIFE;
OR, COURT AND CITY.
By MRS. GORE, Authoress of 'Mothers and Daughters,' 'Mrs. Armytage,' &c.
HENRY COLBURN, Publisher, 13, Great Marlborough-street.

London: JAMES HOLMES, 4, Took's Court, Chancery Lane. Published every Saturday, at the ATHENÆUM OFFICE, 14, Wellington Street North, Strand, by JOHN FRANCIS, and sold by all Booksellers and Newsvenders.—Agents: for SCOTLAND, Messrs. Bell & Bradfute, Edinburgh; for IRELAND, J. Cumming, Dublin.

THE ATHENÆUM

Journal of English and Foreign Literature, Science, and the Fine Arts.

No. 828. LONDON, SATURDAY, SEPTEMBER 9, 1843. PRICE FOURPENCE (Stamped Edition, 5d.)

For the convenience of Subscribers residing in remote places, the weekly numbers are reissued in Monthly Parts, stitched in a wrapper, and forwarded with the Magazines.—Subscriptions for the Stamped Edition for the Continent, for not less than Three Months, and in advance, are received by M. BAUDRY, 3, Quai Malaquais, Paris, or at the Athenæum Office, London. For France, and other Countries not requiring the postage to be paid in London, 28fr. or 1l. 2s. the year. To other Countries, the postage in addition. [JAMES HOLMES, TOOK'S COURT, CHANCERY LANE.]

UNIVERSITY COLLEGE, LONDON.—JUNIOR SCHOOL. Session 1843-44. Under the Government of the Council of the College.

Head Master—THOMAS H. KEY, A.M.

The School will OPEN on MONDAY, the 25th of September. The Session is divided into three terms—viz. from the 25th of September to Christmas, from Christmas to Easter, and from Easter to the 4th of August. The yearly payment for each Pupil is 15l., of which 5l. are paid in advance each term. The hours of attendance are from a quarter-past Nine to three-quarters past Three. The afternoons of Wednesday and Saturday are devoted exclusively to Drawing.

The subjects taught (without extra charge) are Reading; Writing; the Properties of the most familiar objects, natural and artificial; the English, Latin, Greek, French, and German Languages; Ancient and Modern History, Geography, both Physical and Political; Arithmetic, and Book-keeping; the Elements of Mathematics, and of Natural Philosophy; and Drawing.

Any Pupil may omit Greek, or Latin and Greek, and devote his whole attention to the other branches of Education.

There is a general examination of the Pupils at the end of the Session, and the Prizes are then given.

The discipline of the School is maintained without corporal punishment.

A monthly report of the conduct of each Pupil is sent to his parent or guardian. Several of the Masters receive Boarders.

Further particulars may be obtained at the Office of the College.

CHAS. C. ATKINSON, Secretary to the Council.

The COLLEGE LECTURES in the Classes of the FACULTY of MEDICINE commence on the 2nd of October; those of the FACULTY of ARTS on the 16th of October.

August, 1843.

UNIVERSITY COLLEGE, LONDON.—JUNIOR SCHOOL.—Mr. W. HASELWOOD, Private Tutor and Assistant Master, RECEIVES a limited number of PUPILS from the School. The house adjoins the play-ground of the University, to which (with permission of the Council) a communication has been opened for the pupils' recreation. Mr. Haselwood undertakes the tuition of the pupils under his care in the subjects connected with their College reading, and in those branches of education that have an immediate reference to their future prospects in life. Each pupil has a separate bed; and the number being limited, a term's notice is required prior to removal.—Further particulars may be obtained by application at Mr. Haselwood's residence, No. 20, Upper Gower-street.

KING'S COLLEGE, London.—SCHOOL.—The THIRD TERM will begin on TUESDAY, the 19th instant, when new Pupils will be admitted. Further information may be obtained at the Secretary's Office.

Sept. 1843. J. LONSDALE, Principal.

BOTANY..R. D. Hoblyn, A.M. Oxon.
COMPARATIVE ANATOMY and NATURAL HISTORY..Dr. W. B. Carpenter, of Bristol.

Prospectuses for further particulars of the Lectures and Hospital Practice may be had by applying to Mr. Whitfield, resident Medical Secretary.

A WIDOWED GENTLEMAN, with two Daughters, of the ages of fourteen and ten years, and having a considerable establishment, is in want of a LADY, from thirty-six to forty-five, to undertake the ENTIRE MANAGEMENT of his HOUSEHOLD. She must be a Member of the Established Church, and must have moved in good society, as, in addition to the important duties attendant on the control of the household, she will be required to superintend (with a Governess under her) the education of the two young Ladies.—References of the highest respectability will be indispensable; and none need apply who have not qualifications and experience fitting them for so responsible a charge, and whose character in every respect will not bear the strictest investigation.—All letters to be post-paid, addressed to Box No. 130, Post-office, Leeds.

HOWE, LEONARD & CO., AUCTIONEERS AND COMMISSION MERCHANTS, BOSTON, UNITED STATES.—Particular attention given to Sales of New and Old Books, Paintings, Engravings, and Fancy Goods; also any other description of Merchandize. Refer to John Miller, Bookseller, London; Goddard & Hill, Birmingham.

RECONNOITERING TELESCOPES.—These beautiful Instruments, measuring but 3½ inches when closed, possess sufficient power to show clearly Jupiter's moons, price 35s., securely packed and sent through the post for 1s. To be had only of the maker, JOHN DAVIS, Optician, Derby; or at the establishment of his brother, High-street, Shrewsbury.

IMPEDIMENTS and RELAXATION of the UVULA.—MR. FOSTER (late of Edinburgh) continues to INSTRUCT, in his originally discovered system, for REMOVING IMPEDIMENTS of SPEECH, and restoring the vocal powers, injured by over-exertion in public speaking or reading. Terms moderate.—Ivy Lodge, Cowes, Isle of Wight.

FURTHER TIME REQUIRED.

THE Public is respectfully informed that the ROYAL POLYTECHNIC INSTITUTION will RE-OPEN on MONDAY, the 18th of September. The period of the Close will be fully occupied in perfecting the Novel and EXTRAORDINARY POWER of ARMSTRONG'S HYDRO-ELECTRIC MACHINE, which, with a new FEATURE in the MICROSCOPE, and other NOVELTIES, will be introduced on the re-opening.

CONCHOLOGIA ICONICA. A complete Pictorial and Descriptive Repertory of SHELLS; to which will be added a series of Representations of their Animal Inhabitants. By LOVELL REEVE, F.Z.S. A.L.S. &c. Now publishing under the distinguished patronage of H.R.H. Prince Albert, His Majesty the King of the French, His Majesty the King of Denmark, The Marquis of Northampton, The Grand Duke of Tuscany, and most of the Natural History Societies of England and the Continent; in Monthly Numbers, with text, and figures of the natural size, price 10s. each Number, coloured. No. 8 on the 1st September.

THE LINNÆAN LITHOGRAPHIC PRESS.—The art of chemical printing, either lithographic or zincographic, having greatly superseded the use of copperplate printing for Natural History Illustration, on account of its economy and peculiar softness for colouring, it has become necessary that this important department of the art should be practised exclusively by one who would conduct it with the zeal and discrimination of a naturalist. The Author of the 'Conchologia Iconica' begs respectfully to announce that he has now in operation the most complete lithographic apparatus ever imported into this country, and having used it with great economy and success for the printing of his own drawings, is now ready to execute the most simple or elaborate subjects on Botany, Zoology, Geology, or any of the Natural Sciences, at a cheaper rate than has been hitherto attained. Engravings transferred from copper to stone. Estimates given either for the entire illustration of a subject, including use of stones or zinc plates, drawing, printing, colouring, &c.; or for the printing only.

Lovell Reeve, Naturalist and Scientific Lithographer, 8, King William-street, Strand.

BRITISH METALLURGICAL ASSOCIATION of ALICANTE.—According to a statement lately printed by the Directors of the above Association at Alicante, it appears that the result of their operations to 30th April, 1843, was—

	Dollars.	
373,738 oz. Silver delivered at their works agreeably to contracts entered into, the proceeds	418,037	14 6
16,084 cwt. of Leads, of which 8,084 had been shipped to England, the proceeds, including a profit insured on cargo, per *Ocean Child*, which vessel foundered at sea	81,618	0 26
8,000 cwt. remained for sale or further shipment. The cost of the Buildings at Alicante	33,430	9 0
The cost of Machinery from England, and erecting seven furnaces	28,696	16 15
The cost of a Smelting Establishment at Garrucha, with five furnaces complete, which now yields from 40,000 to 45,000 ounces of silver monthly, besides lead, at a comparatively small expense, owing to its proximity to the mining district	45,000	0 0
	107,127	5 15
Profits on an average of nine months' work, with actual force at both works, on a capital of only 50,000 dlrs.	54,904	7 16
Deduct extraordinary expenses, which will not occur again, incurred in bringing from England an experienced assayer, and the necessary workmen of every description, including their salaries until the works were ready	D. 10,000	0 0
and interest on monies taken on loan	14,204	19 20
	24,204	19 20
	D. 30,699	7 20

Net gain on 30th April, 1843, including every charge from commencement of the enterprise 16 months ago, for a dividend of 61 per cent.

At a General Meeting of Shareholders held on the 31st of May last, in conformity with the rules of the Company, it was resolved that 250 additional shares (or more, if the Directors judged fit) should be issued at 400 dlrs. each; of these a number were at once subscribed for, and by last advices about one-fifth of the new issue had been disposed of. It was originally contemplated by the leading shareholders that the capital of the Company should be composed of 2,000 shares, at 100 dlrs. each; however, it was finally agreed on between them that a trial should be made with only 500; this has been done, and with such very flattering results, that the recommendation of the Directors in favour of a further issue of shares for the purpose of forming a more suitable capital, was unanimously approved of.

N.B. By the 13th article of the Deed of Settlement, and in accordance with the articles of the Spanish Commercial Code, Shareholders are only answerable for the liabilities of this Company to the extent of their respective shares.

Applications for shares (400 dlrs. each—85l. sterling) to be made at the office of the Company's London Agents, 28, Bucklersbury, between the hours of 11 and 2. CLAY & GILLMAN, 28, Bucklersbury, Aug. 25, 1843. Agents.

Now ready, Third Edition, 2 vols. post 8vo. 18s.

THE GYPSIES of SPAIN; their MANNERS, CUSTOMS, LANGUAGE, and CEREMONIES. By GEO. BORROW, Esq., Author of the 'Bible in Spain,' and late Agent of the British and Foreign Bible Society in Spain.

John Murray, Albemarle-street.

London; Whittaker & Co.: and Alnwick; Mr. Smith.

MRS. TROLLOPE'S NEW WORK.

Now ready, in 3 vols. with Illustrations by Leech,

THE BARNABYS IN AMERICA.

Being the Sequel of THE ADVENTURES OF THE WIDOW BARNABY.

By Mrs. TROLLOPE.

"We have had nothing so entertaining as 'The Barnabys in America' since the somewhat similar productions of Smollett—to which it is scarcely inferior either in force or in humour."—*Naval and Military Gazette.*

"The bouncing, tricky, and clever Mrs. Barnaby is unquestionably Mrs. Trollope's chef-d'œuvre. 'The Barnabys in America' will support her well-earned reputation, as one of the first female writers of the day."—*Court Journal.*

"Mrs. Trollope is, unquestionably, one of the cleverest and most remarkable writers of the day."—*Quarterly Review.*

Henry Colburn, Publisher, 13, Great Marlborough-street.

MR. AINSWORTH'S NEW HISTORICAL ROMANCE,

WINDSOR CASTLE, ILLUSTRATED.

THE BIOGRAPHICAL DICTIONARY
OF THE SOCIETY FOR THE DIFFUSION OF USEFUL KNOWLEDGE.
Vols. I. and II. in Four Half-Volumes, 8vo. 12s. each, cloth.—To be continued Quarterly. Half-Vol. 5 (Vol. 3, Part 1), 8vo. 12s. cloth, is published this day.
"The articles contain internal evidence of original investigation; and for number of subjects, originality, and pains-taking research, with breadth and often vivacity of treatment, 'The Biographical Dictionary of the Society for the Diffusion of Useful Knowledge' is, *longo intervallo*, the best English publication we have seen."—*Spectator.*

2.
Barker's Lempriere, revised by Cauvin.
LEMPRIERE'S
CLASSICAL DICTIONARY,
Abridged for Public and Private Schools of Both Sexes. By the late E. H. BARKER, of Trin. Coll. Camb. A New Edition, revised and corrected throughout by JOSEPH CAUVIN, Assistant Editor of 'Brande's Dictionary of Science, Literature, and Art.' 8vo. 12s. bound.
*** This is the only edition containing every article in the original, divested of all indelicacy. A quantity of matter not calculated to assist the scholar has been expunged; numerous repetitions which encumbered the preceding editions have been removed; and the size of the original volume has been increased by upwards of one hundred and fifty pages.

3.
New Series of Life in Sweden.
THE
PRESIDENT'S DAUGHTERS;
Including NINA.
By FREDERIKA BREMER. Translated by MARY HOWITT.
3 vols. post 8vo. 31s. 6d. boards.
"In the exhibition of everyday life in Sweden, so far as we are able to judge of it, Miss Bremer is without a rival—full of matter, close in observation, characteristic in touch, and felicitous in expression, by the exact adaptation of style and diction to the thing described."—*Spectator.*
"The genius of Frederika Bremer shines out strongly in 'The President's Daughters.' There is poetry in the conception, vigour in the working out; and the lofty and sustained tone of high intellectual spirit animating the story cannot fail to fascinate all classes of readers."—*John Bull.*
"In these volumes may be found theories for the philosopher and theologian, themes for the poet, fun for the lover of humour, and love and romance for the novel-reader."—*Inquirer.*
"Miss Bremer possesses, beyond any other living writer of her class, the power of realising to the imagination every individual she introduces. There is scarcely a single person in her multitudinous groups that does not stand out palpably in his living lineaments. The minute fidelity of her details; the vivid distinctness with which every mental struggle and secret emotion is traced; the moral beauty and womanly purity which steadily illuminate her narrative; and the calm Christian philosophy out of which all its earnest lessons of truth and justice, and resignation, and serene wisdom, are drawn, must receive implicit admiration on all hands."—*Examiner.*
By the same Author,
THE NEIGHBOURS: a Story of Every-day Life. Third Edition, 2 vols. post 8vo. *In the press.*
THE HOME; or, Family Cares and Family Joys. Second Edition, 2 vols. post 8vo. *In the press.*

4.
Professor Owen's Hunterian Lectures.
LECTURES ON THE COMPARATIVE
ANATOMY AND PHYSIOLOGY
OF THE
INVERTEBRATE ANIMALS,
Delivered at the Royal College of Surgeons in 1843.
By RICHARD OWEN, F.R.S., Hunterian Professor to the College. From Notes taken by WILLIAM WHITE COOPER, M.R.C.S.; and revised by PROF. OWEN.
Octavo, with nearly 140 Illustrations on Wood, 14s. cloth.
"It is sufficient to announce a work on the comparative anatomy of the *Invertebrata* by Mr. Owen. Were it necessary to recommend it, we should say, that the desideratum it supplies has been long felt by students of natural history; and that no writer of the present day except Mr. Owen could have ventured to approach the subject: his enlightened researches having made the delightful department of science in which he has created his brilliant reputation legitimately his own; and, indeed, organised into a system an interesting branch of knowledge in which he found only a few scattered and imperfectly known facts."—*Medical Gazette.*

5.
The Marquis De Custine's Work on Russia.
THE EMPIRE OF THE CZAR;
Or, Observations on the Social, Political, and Religious State and Prospects of Russia, made during a Journey through that Empire. By the MARQUIS DE CUSTINE. Translated from the French. 3 vols. post 8vo. 31s. 6d. cloth.
London: Longman, Brown, Green, and Longmans.

FELIX SUMMERLY'S
RECREATION HAND-BOOK GUIDES,
Corrected for the Season of 1843.
"Recreation is a second creation, when weariness hath almost annihilated one's spirits. It is the breathing of the soul, which otherwise would be stifled with continual business.... As for those that will not take lawful pleasure, I am afraid they will take unlawful pleasure, and by lacing themselves too hard grow awry on one side."
FULLER'S HOLY AND PROFANE STATE.

Price 3s. 6d. in an Ornamental Cover of the 16th Century,
NATIONAL GALLERY,
WITH FIFTY REMINISCENCES OF THE MOST CELEBRATED PICTURES, DRAWN EXPRESSLY FROM THE ORIGINALS, BY MESSRS. JOHN JAMES AND WILLIAM LINNELL.
A few copies of this Edition, with each Engraving on a separate leaf, are printed in umber for colouring, price 10s. in a portfolio. To be had of the Publisher, and of Messrs. Paul & Dominic Colnaghi, Pall Mall East.
(Open daily, from Ten to Four, except Friday and Saturday.)
Other Editions, price 6d., 3d., and 1d. Also,
Catalogue des Tableaux qui se trouvent dans la GALERIE NATIONALE. Prix 6d.

HAMPTON COURT PALACE.
(OPEN DAILY, EXCEPT FRIDAYS.)
Being a Guide to the Architecture, Tapestries, Paintings, Gardens and Grounds of Hampton Court: with numerous Embellishments on Wood, engraved by Ladies; and Plans of the Palace and Grounds from Official Surveys. The Illuminated Cover is taken from a design for a book-cover produced by Hans Holbein for Cardinal Wolsey. Second edition, price 5s. in cloth, and Holbein's cover in gold, with Maps and Plans; and 2s. 6d. not gilt, and with plan only.
"Decidedly the best popular guide to the picturesque beauties of Hampton Court of any extant."—*Spectator.*

FREE PICTURE GALLERIES;
Being a GUIDE to all the PICTURES in the NATIONAL GALLERY, the DULWICH GALLERY, the SOANE MUSEUM, the SOCIETY of ARTS, and the BRITISH MUSEUM. Price 1s. 6d.
"These Catalogues are more raisonnés and correct than the correspondent official ones; are more portable, and to their limits every way commodious, whilst they cost together much less than several of the latter cost separate."—*Athenæum.*

HOLIDAYS; a Guide to London Sights. 6d.

WESTMINSTER ABBEY.
(The Abbey opens at 9 A.M., and closes, in the Summer, at 6 P.M. The Tombs are shown until half-an-hour before, and about an hour after, Divine Service, which commences at 10 A.M. and 3 P.M. Entrance to Poets' Corner, free; to the Nave, alone, 3d.; with the Chapels, 6d.)
A Guide to the Architecture, Sculptures, Tombs, and Decorations, with 56 Embellishments on Wood, engraved by Ladies, 4 Etchings, a Specimen of Encaustic Tiles in the Chapter House, and an Illumination. Price 7s. Cheaper Editions, 3s., 1s. 6d.
"Its pages are not disfigured by the usual Guide-book sentimentality, rambling on without method, and mixing inaccurate if not false information with indiscriminate and nauseating praise, but it gives a well arranged and correct description, neither too popular nor too pedantic, of the Sacred Edifice."—*Ecclesiologist*, published by the Cambridge Camden Society.
"A volume got up in excellent taste, and written in a right spirit; critical so far as criticism could be allowed, but always suggestive, and testing opinions by reference to principles. As if to perfect the interest of the work, its fifty-six illustrative engravings have all been executed by women; and some amateurs, Lady Talcott and Lady Palgrave, amongst others, have gracefully contributed drawings, and thus associated their names with their sister artists."—*Athenæum.*

GUIDE A L'ABBAYE DE WESTMINSTER.
Prix 1sh.

TEMPLE CHURCH.
With Eight Illustrations. Printed in three colours, in novel combinations of lithography and type, with Ornamental Cover of the pattern of the Encaustic Tiles. Second Edition. Price 1s.

A HAND-BOOK for CANTERBURY; with 35 Illustrations, 2s. 6d.; cloth extra, 3s. 6d.

REVIEWS

The Drama in the Middle Ages, and the Passion-play at Ammergau—[Das Theater im mittel Alter, &c.] By Dr. Görres. Munich, Cotta.

ALL readers conversant with the annals of the European stage, are aware, that the origin—the how, the when and the where—of those singular religious spectacles, denominated 'Mysteries' and 'Moralities,' is still a *vexata quæstio*. The mists that enveloped, as it were, the childhood of the gorgeous Athenian drama, have been long cleared away by the common consent of the learned. Gay Dionysos and his jocund satellites, the fauns and satyrs; the goat, meet victim to the vineyard-god; the waggish mummers of the Grecian village—the lofty poetry of the dithyramb succeeding their rude and extemporaneous strains; the Icarian and his improvements; and lastly, the gradual transition of the embryo muse till it attained its glorious perfection under the life-inspiring influence of its three greatest luminaries,—all these matters have ceased to be mooted questions. Not so with the drama of modern Europe. The disquisitions of Warton, and, in our day, the researches of Mr. Collier, have thrown much light certainly on this still dark leaf of literary history. But however satisfactory their conclusions may seem to be, we still think that much, illustrative of the mutual workings and influences of the early Continental and English drama upon each other, still remains to reward the labour of the antiquary.

The work before us, which, we believe, is the forerunner of a comprehensive and detailed history on this subject, throws some new light upon these matters, as far as the author's own country is concerned; and he adduces evidence, demonstrating pretty clearly that in these pristine representations, out of which grew the present acted drama, Germany can lay claim to a much more remote antiquity than writers have generally been willing to concede. But, by way of preamble, we shall, at the risk of treading here and there on beaten ground, lead the reader's attention to certain facts connected with the subject.

Probably the oldest drama on a religious theme of which we have any account, is one composed by a Jew named Ezekiel, entitled Ἐξαγωγή. It was a tragedy representing the departure of the children of Israel from Egypt. The fathers of the church, and particularly Eusebius, have preserved fragments of this piece; but, as a whole, it is not extant. The next is the well-known 'Christus Patiens' of Gregory Nazianzen, modelled on the plan of the Athenian drama, in which were represented the sufferings of the Redeemer; the choruses being metamorphosed into Christian hymns. The third of the known writers of this kind of composition was "a pensive nun, devout and pure," *Hroswitha* or *Rhoswitha*, of the abbey of Gandersheim, in Saxony, who lived in the 10th century. Amongst other writings on sacred subjects, she composed, we are informed, six spiritual plays in Latin prose. Maguin, Villemain and Saint Marc Girardin, have largely commented on the writings of this pious lady in their lectures on modern literature. "In the prolegomena," says our author, "she explains her motive for inditing the above plays: 'she had observed,' she said, 'that Terence was studiously conned over by many Catholics, on account of the allurements of his style; although he was a poet addicted to pourtraying the lewd behaviour of unworthy females, and thereby inculcated much unprofitable stuff in the minds of his perusers.' Seeing this, then, she had not delayed to lift up her voice (*clamor validus Gandeshemensis*) for the honour of God and virtue. 'I have striven,' she proceeds, 'according to the measure of my understanding (*juxta mei facultatem ingenioli*) to celebrate the triumph of modesty, and show how the weakness of woman can put to shame the brutality of man.'" These plays, according to Dr. Görres, were acted by Hroswitha's fellow nuns. If so, this is the earliest representation of which we have historical proof. Indeed, England does not possess, as far as we are aware, any *written* religious drama bearing so early a date. The miracle play of St. Catherine, the earliest that is known to have been performed in England (viz. in the year 1110, at Dunstable), was, according to the best authorities, composed in French, and produced under the direction of the Frenchman Geoffry, member of the University of Paris, and afterwards Abbot of St. Albans. It will be all the more strange if these Saxon plays are anything more than religious pageants—as L'Enfant, the historian of the council of Constance (1414), relates that the Bishop of Salisbury, and the five other bishops who were present at this religious congress, invited the authorities and respectable burghers of the town of Constance to a pageant at which was performed the 'Mystery of the Holy Nativity,' the 'Adoration of the Wise Men,' and the 'Slaughter of the Innocents;' and from this he concludes that English clergymen were the originators of the scriptural drama in Germany: an opinion in which more than one German has followed him. Menzel, for instance, who says, "As he (Pope John XXIII.) was crossing the Alps, his carriage happening to be overturned in the snow, he cursed in the Devil's name, to the great *edification* of the pious peasants of Arlberg.* Besides the main actors in this scene, many spectators and divers other persons streamed together to the town. Among the rest were seven hundred travelling dames, or lewd women, whose company neither lords spiritual nor temporal could do without; besides 346 players, conjurors, and mountebanks. *The players were brought by the English clergy, and represented brilliant scenes. From hence the German theatre derived its origin.*"

It is more than probable, that as the churchmen throughout Europe were in that age in communication with Rome,—deriving light from the same source—these Mysteries or Miracle plays, sprung up everywhere about the same period; if so, differences about date relate rather to the accidental preservation of particular dramas than to the origin of the drama; but it appears to us that it was in England that they first became general as a source of public amusement. Frequent are the allusions made to them in our early writers. Chaucer's Wife of Bath diverted herself with these amusements during the flesh-macerating season of Lent, when her lord was absent in London.

> Therefore made I my visitations
> To plays of *miracles* and to marriages.

Again, in Robert Langdale's 'Piers Ploughman's Crede,' two lines are put in the mouth of a friar, which plainly intimate that miracle-plays were performed, not only in London (a standing monument of which fact is to be found in the notable inscription on Clerkenwell pump) and the larger cities, but also in the market towns of the provinces—

> We haunten no tavernes,
> At markets and miracles we medely us never.

In process of time they appear to have been exchanged for episodes of classic mythology, though still continuing to be solemnized on "high days of the calendar" as of yore. Thus the love-lorn Julia relates to Silvia in the 'Two Gentlemen of Verona,' how—

> At Pentecost,
> When all our pageants of delight were played,
> .....
> I did play a lamentable part
> Madam, 'twas Ariadne, passioning
> For Theseus' perjury and unjust flight.

At an earlier period, we find these Mysteries, or Miracle Plays, or Pageants, for it is often difficult to say which is referred to, simultaneously in vogue throughout all Europe. At Paris, the Confrèrie de la Passion, as it was called, received a patent from Charles VI., in the year 1404, which gave that body the exclusive privilege of acting mysteries. We know from Muratori, that in Italy they were acted towards the close of the thirteenth century. In the year 1264 A.D., the brotherhood of del Gonfalone was instituted at Rome, and performed religious pageants in the Coliseum till 1549, when Pope Paul III. issued an interdict against their continuing any longer to use that building. Nevertheless, the representations proceeded, but in another place. Coeval with the establishment of this society was the origin of our "Chester Mysteries." The Corpus Christi plays, which are of somewhat later date, were performed at York for a number of years, the different guilds of the town undertaking to perform certain parts. Indulgences even were granted by Pope Urban to those who attended them.

The libraries of the Netherlands and Flanders are said to be, at the present moment, complete storehouses of old religious plays, written in the Flemish dialect: and we will venture to hope, that the new impulse which has been given to the study of the ancient literature of Belgium, will bring forth fruits in this respect. At Valenciennes, a society called "Confrèrie de Notre Dame du Pay," was, according to the ancient chronicles of that city, founded in 1229 and renewed in 1426. "The four presidents were intrusted with the providing of three minstrels and two trumpeters, for the more favourable representation of their festivities. A stage used to be erected on the Sunday of the ascension of the Virgin, and her image was carried in procession to the accompanying chorus of twelve persons, clad like the Apostles, and singing children representing angels. In the great aisle of the church at that point, where there was the greatest profusion of statues and pictures, a stage was erected for the effigy of the Virgin, above which shone a heaven, and the mystery of the ascension was thus accurately represented. Hereupon came forth certain persons, who recited poems in praise of our Lady. The most successful of these received from the society a silver crown, the second best a silver chaplet, and the rest two bottles of wine a piece for their good intentions. The preacher got half a sheep as his perquisite, the apostles, above mentioned, a plate of fruit and half a bottle of wine, and the Carmelites and Dominicans of the town, who had been present at the pageant, by invitation, received, as a guerdon, double rations from the refectory."

The brotherhood of St. Luke, a similar society composed of painters, sculptors, architects, and tapestry-workers, existed at Antwerp, and a play acted by them in the fifteenth century is still preserved.

In comparison with England, which, in addition to other scattered remnants, possesses entire three whole series of these religious compositions, viz. the Coventry, the Townley (or Wildkirk) and the Chester mysteries; Germany is, as yet, but meagerly supplied with *published* specimens of such writings. In the Royal

* Apropos of this council, "Date operam, ut illa *nefanda schisma* cradicetur," said the vain Emperor Sigismund to the assembled conclave. A cardinal exclaimed, "Domine, schisma est generis neutrius," upon which Sigismund retorted, "Ego sum Rex Romanus, et super grammaticam."

Library at Munich, as we are told by our author, are manuscript fragments of more than one religious drama. They are written in German and Latin, and are ascribed to the fourteenth and thirteenth centuries, and even to an earlier period. Another fragment, on the subject of the resurrection, and dating in all likelihood from the fifteenth century, has been published in the *Deutsche Lese-Buch*, by Wackernagel. It is remarkable, inasmuch as it is a species of pastoral farce, possessing regular comic scenes, between a merchant and his wife, interspersed with serious and religious songs, thus showing like a kindred English piece, the 'Adoration of the Shepherds,' the gradual transition from strictly religious themes to the every-day scenes of common life; laying, by this means, the foundation for the innovations of Jacob Ayrer and Hans Sachs, under whose auspices Hanswurst, the German clown, or gracioso, of the piece, first began to convulse the audience. Another fragment, written half in Latin, half in vulgar French, 'The Wise and Foolish Virgins,' begins with the following words of the bridegroom,—

Adest sponsus, qui est Christus;
Vigilate virgines!
Pro adventu ejus gaudent,
Et gaudebunt homines.

In the town records of Berlin and Cologne are to be found accounts of the sums disbursed by the burghers on behoof of the composers and directors of these mysteries. The following is curious:—

Chance (says our author) has put us in possession of the fact of a mystery having been represented in 1332, in the Thiergarten at Eisenach, by divers clergymen of the place and their scholars, for the amusement of Frederick, Margrave of Thuringia, and Landgrave of Meissen. It was to commemorate the restoration of peace after a long succession of bloody feuds. The players had selected the parable of the Wise and Foolish Virgins' (this seems, by the bye, to have been a favourite subject). Matters, however, turned out rather untowardly for them. For when the foolish virgins begged the wise ones for the loan of a little oil, and were ejected by the bridegroom, they set to whining and weeping most piteously, and invoked the saints to intercede in their behalf, but neither saints nor holy virgin could do aught to alleviate their doom. Upon this, the Landgrave fell into doubts, got into a furious passion, and cried out, "What is the good of your Christian creed if God will not take pity upon us, no, not at the intercession of the Virgin Mary and all the saints?' Five mortal days did they, according to the chronicle, remain at issue on this point, and the learned monks had no little ado to make him at last comprehend aright the meaning of the gospel.

A saying, which rests, however, on no very good authority, states that scenic representations, though not of a religious cast, were given as early as 1416 in the Tyrol. Duke Frederick "of the empty purse," so runs the legend, when outlawed by the Emperor Sigismund, fled from Constance, and concealed himself for some time among the frightful glaciers of the Oetz-thal, the same fastnesses in which the patriot Hofer baffled for a while the pursuit of his foes. At length the Duke ventured down to Landek, in the valley of the Inn, and had an interview with one Von Müllinen, who was still faithful found among the faithless. With this man he arranged a plan for discovering whether "all love for their unhappy lord was extinguished in the breasts of his folk." The project they hit on was this: a play was contrived, depicting in lively colours the sufferings of a deserted and beggared prince. The attempt succeeded; the spectators were moved even to weeping at the misfortunes of the deserted one; at that moment the unknown stranger, who had lately appeared in the valley, came forward, and discovered himself to be their banished sovereign; and they willingly extended to him the hand of welcome and protection.

That same year the Emperor Sigismund visited England, and during his sojourn in this country the play of St. George and the Dragon was performed for his special diversion at Windsor. Soon after, this identical pageant became very general in Germany, though we do not hear of it previously; it is not unfair, therefore, to suppose, that for this piece at least, the Germans were indebted to us. At Botzen, in Southern Tyrol, where it was annually exhibited, the part of St. George was sustained by a nobleman, while the king's daughter was played by a "Fräulein"—*i. e.*, miss of gentle blood. It was only lately, says our author, that the properties thereunto appertaining, such as the ingeniously-wrought armour of the knight, were sold by the town to a Russian curiosity hunter.

Gervinus in his learned, though somewhat abstruse work, 'The Poetical National Literature of the Germans,' says that miracle plays were exclusively confined to the north of Germany at the time of the Reformation. Our author, who is the son of old Professor Görres, the Arch-ultramontanist of Munich, takes occasion to allude to this, and in somewhat of a splenetic mood. "At that period," says he, "they had become debased into a mere vehicle for polemics;" and he proceeds to quote one, whose title is 'Ein ganz lustig Spiel, darin des Antichristlichen Papsthums teufflische Lehre und Wesen wundermeistlich dargeben wird,' which quaint old German being interpreted, is "A right merrie play, in the which the devilish doctrine and essence of Antichristian Papacy is represented after a wondrous masterful fashion." The fact is, Luther himself does not seem to have discountenanced these monkish lucubrations; perhaps, on the contrary, he was glad to use them as auxiliaries in his great work. He saw that they might be made to return and plague the inventor. In his preface to 'Judith' he recommends these sort of diversions on truly Christian grounds. "And perhaps the Jews played such poems in like manner as one plays the 'Passion,' and such like Holy Scripture histories amongst us, that the folk might learn to trust in God, as it were, in an image or play." At all events, the assertion of Gervinus will not hold at a subsequent period, for we learn from Menzel that in 1571, the 'Last Judgment' was played at Stuttgard, when the fire of hell extended somewhat beyond its legitimate bounds, the devils fled, and God the father, from aloft, began to call out dreadfully, fearful of perishing in the flames. The above-mentioned author also tells us, that in 1593 a 'Tragico-Comedia Apostolica' was brought out at Lauingen, in which there were no less than 246 performers.

In England the days of masque and antique pageantry have long gone by, and our Christmas carols are, perhaps, the only living pastime left to remind us of the substance of the people's histrionic amusements four centuries ago. It is not so in Germany: but we must reserve our notice of the Passion Play at Ammergau till another opportunity.

A Series of Essays on the Principles of Evil manifesting themselves in these last Times. By S. R. Bosanquet, Esq. Burns.

TOLERATION in religion, utilitarianism in philosophy, and the commercial system in politics, appear to Mr. Bosanquet to be "the three unclean spirits like frogs," which St. John in the Apocalypse saw "come out of the mouth of the dragon, and out of the mouth of the beast, and out of the mouth of the false prophet." He proposes (at least we so interpret his reveries) that we should get rid of our European systems of responsible administration, and establish Asiatic despotism in our land; he declares that the Chinese empire makes the nearest approach to moral perfection in its government, and labours to prove that institutions are pernicious in direct proportion to their being based on reason. We have long lamented the growth of a mystic school anxious to set authority above argument, to place legends on a level with chronicles, and to forbid the exercise of scrutiny when doubtful evidence is presented; but we did not expect that any disciple of that school would go so far as to declare that the study of Aristotle's logic necessarily leads to infidelity, that parables are preferable to syllogisms, and a proverb entitled to more respect than a deduction of reason. We have met many disposed to bestow praise on past times, but until now we never found any prepared to assert that the present progress of civilization is from corruption to corruption, and that all the apostacies described by the prophets and apostles were types of the downward progress of society in England, and in Christendom influenced by the example of England. An author who fixes all his hopes for the regeneration of humanity on the empire of China, may safely be dismissed with scant notice; but an author who pretends to show from facts that the progress of our age and nation is in the direction of iniquity and decay, must not pass without inquiry from those who believe that Divine Providence rules the onward movement of humanity, and that its agency is directed to evolve good from evil, not evil from good.

Two great evils in our present progress, as we understand Mr. Bosanquet's arguments, are, that school-boys are not flogged, and criminals are not hanged so freely as they used to be; and it is a serious ground of complaint that motives of pleasure and profit are used as stimulants to exertion instead of "fear and force." This indeed is the great principle of his philosophy,—that obedience, to be valuable and praiseworthy, should be unreasoning and compulsory, for there can be no merit in a man's pursuing that which he perceives to be advantageous. We agree with him that the tendency to inquire into the reasons on which existing institutions are based is rapidly increasing, but we deny that the effect has been to weaken in the slightest degree the influence of beneficial institutions.

It is a matter of some interest to note a few of the social changes which have taken place within the last thirty years, and see how far they justify Mr. Bosanquet's charge of social degeneracy. Commencing with a subject on which he has bestowed some thought, "the education of the higher and middle classes," our author has justly reprobated the exclusive attention bestowed on the languages and literature of Greece and Rome; but no one can deny that this exclusiveness is fast disappearing. Let the inquirer cast but a glance at the *curriculum* of studies in any of our large schools, and it will be found that history, mathematics, the elements of moral philosophy, portions of the experimental sciences, modern languages, and in many cases natural theology, have been superadded to the old scholastic course. We have conversed with many connected with the management of schools, and all have agreed that there is a higher moral tone among the school-boys of the present, than of the past generation; flogging is either falling into disuse or greatly alleviated; rebellions, and barrings-out are scarcely known; and that voluntary study is fast becoming the rule, and compulsion the exception; and that it is not uncommon to find a taste for general literature developed in early youth.

As to the general tone of society, it is within

Digitized by Google

the memory of even men of middle age that a dinner party among the higher or the middle classes was a scene of indulgence in stimulants to an excess which would not now be tolerated; a host believed it his duty that no man should leave his table sober, and a guest conceived himself bound to do justice to his host's hospitalities, by going at least to the verge of intoxication. With this custom, looseness of conversation has been banished, and the habit of profane swearing abandoned, cock fights, dog fights, bull baitings, bear baitings—exhibitions common and universal in our younger days—are now nowhere to be seen or heard of—and the patrons of pugilism are not as heretofore to be found among the noblemen and gentlemen of England—cruelty to animals no longer forms a part of fashionable amusements.

The importance which Mr. Bosanquet himself attributes to the treatment of the working classes is a proof of advancement. It is not very long since when the masses were described as "the swinish multitude," and when the advocates of their rights and comforts were answered by sneers and ridicule. Now every political party inscribes on its banner advocacy of the rights of the labouring poor. We quite agree with Mr. Bosanquet, that industry is still subjected to many unfair conditions, and that there exist unwise impediments to the accumulation of small profits, and the realization of small capitals; but we deny that these impediments are of modern growth, and could easily show that most, if not all, have risen from the obstinate maintenance of institutions unsuited to the present state of commerce and labour.

Mr. Bosanquet, in good set terms, asserts that cheating is the principle of modern trade, and that confidence in mercantile honour has ceased to exist. We assert, that the principles of commercial credit were never more firmly established nor more extensively acted upon. Frauds of great magnitude may be pointed out, but before deducing any inference, their proportion to the entire of the mercantile transactions of the community must be ascertained. It is generally agreed that the annual amount of bills, notes, and other representatives of credit, do not fall very short of one thousand millions annually. The proportion of fraudulent non-fulfilment of engagements cannot be easily ascertained, but we have never seen them estimated so high as two millions annually; it would be well if Mr. Bosanquet and his school paid some attention to the figures of arithmetic, as well as the figures of speech.

We will not follow Mr. Bosanquet through his interpretations of prophecy, which are equally remarkable for their boldness of assertion, and want of reasonable foundation. He avowedly spurns logic; he is obviously ignorant of the original language of the old Testament, and not very conversant with that of the New, and he declares himself an enemy to reason, perhaps because reason is manifestly an enemy to him.

Excursions, Adventures, and Field Sports in Ceylon. By Lieut.-Col. James Campbell. 2 vols. Boone.

Col. Campbell promises, in his preface, to treat of high themes, and make the weightier matters of colonization and commerce the "burden of his strain," at least in an equal proportion with the adventures and field sports, which figure so conspicuously in the title-page. The promise, however, is not fulfilled. Whenever, from certain sober indications, we begin to hope for some useful information, the Colonel is sure, after a few words of graver tendency, just sufficient to let us know that he did not consider hunting and fishing the sole objects of existence, to break off abruptly with an elephant hunt or an alligator spearing, and leave us as wise as before regarding "one of the principal" objects of his volumes,—"the commercial and military importance" of Ceylon, and its "numerous advantages to the British emigrant." Amidst his interminable disquisitions on the best gut for fishing lines, and the comparative merits of brass and leaden balls in shooting elephants, and such like idle gossip, we seek in vain for positive information regarding the island of Ceylon and its capabilities. Even his adventures become monotonous, and an air of tiresome sameness runs through the account of his exploits, which are always prefaced by an apology for their apparent incredibility. .Some of them, indeed, are hard to believe, and, if believed, are worth nothing but to make the idle gape and wonder. However, it is not possible to write two thick volumes, on a comparatively little known country, that shall be wholly devoid of interest, and there are occasional passages to be found which partially redeem the character of the book. The following description is pretty and pleasing:—

"It has been well and justly remarked, by an elegant writer, that the district of Matura possesses many picturesque beauties. 'Sometimes venerable and majestic trees formed a shade over our heads; sometimes we travelled amidst flowering shrubs; sometimes through cultivated meadows and fields of smiling corn. Nature breathes around an eternal spring; flower blossoms and fruits adorn the woods at all seasons. A vast wilderness of noble plants rises in ten thousand beautiful landscapes, displaying a majesty and richness of scenery and raising emotions of delight and admiration, which cannot easily be described.' This certainly is a very vivid and fascinating description of a country, and in this instance it is a correct one. But how often have I felt afterwards, in passing through or residing in the forests of Ceylon, how awfully impressive is the stillness of noon! Every animal seeks the deepest shade. The fish conceal themselves at the bottom of rivers or lakes, except where the over-hanging foliage screens them from the rays of a too fervid sun. Not a bird is on the wing; and all nature seems as it were to be at rest, were it not that the almost appalling silence is broken only to be made the more impressive, by the continued low buzz or humming of thousands of insects. How powerfully have I felt, in the thickly-wooded neighbourhood of Matura, all this combination of the great and little of so much that is wonderful in nature! But as soon as the evening begins to be somewhat cool, the world seems again to start into new life. Every creature is in motion, and in search of its prey, or of the food it requires of some kind or other, which the Almighty has so bountifully provided for them all. The wild-fowl, of various kinds, fly in large flocks towards their haunts; the Pea and Jungle fowl call their respective broods around them for the night; even the Jackal begins to howl for its prey. Numbers of flowers, which had closed their leaves before the scorching beams of the sun, now gently unfold them, to remain open to receive the dew which usually falls so abundantly. Here also the pretty moon-flower among the rest, the leaves of which had been shut all the day, opens completely as if to behold the sun's grandeur, as he takes his leave of us in surprising brilliancy! * * It is generally believed, that birds within the tropics, though they have much more splendid plumage than those we find in Europe, cannot sing: this is not the case here; for several of them have the sweetest notes that I ever listened to; and one in particular sings so delightfully as to have acquired the name of the Ceylon Nightingale, from its notes being heard for some time after sunset. But, even when the moon does not afford what may be here truly called her silvery light, we do not always remain in that profound darkness I have before spoken of; for no one, who has not beheld it, can form an idea of the effect produced at night by thousands and tens of thousands of Fireflies and other insects, which emit phosphoric light! I have taken one of them, and put it inside the glass of my watch, and have been able to see the hour distinctly by its flickering light."

Perhaps the Anti-Duel Association may take a hint from Col. Campbell's account of a Ceylon love quarrel:—

"I likewise saw at Bovegoddé what the people called a *water fight*, between, as they told me, two competitors for a dark-eyed maid: one of the lovers, the challenger, being highly exasperated by the pangs which the green-eyed monster—jealousy, generated in his heart. They both stood up to their knees in the lake, opposite each other; and, with their hands, constantly dashed the water, in a curious and expert manner, into each other's faces. I saw the combatants thus—I can scarcely say, hotly engaged, about nine in the morning; and, at three in the afternoon, they were still hard at work, and the battle was then still doubtful; for, according to established rule, whichever of the two warriors, no matter what may be the pretence or cause, stops first, if it be only for a moment, dashing water at his adversary, is considered to be vanquished. Hundreds of people were looking on, apparently deeply interested in the result; as he who is thus overcome, as they assured me, is never known again to aspire to the hand of the lady who has caused the antefebrile combat. What a pity it is, that this cooling mode of settling disputes, is not introduced into the Green Isle, and made to supersede the sprig system, so prevalent there."

Col. Campbell enters at some length on a description of the cultivation of the cinnamon plant:—

"The best and most productive soils of Ceylon are a brown loam, resulting from the decomposition of gneiss or granitic rock, abounding in felspar, or a reddish loam resulting from the decomposition of clay iron-stone, called in Ceylon, Kabookstone. The soil of the cinnamon garden, in the neighbourhood of Colombo, (as well as that near Galle and elsewhere, in which the cinnamon tree is grown; and in many places it is produced naturally,) is a remarkable instance of the silicious kind. The surface of the ground in many places, where the cinnamon plant flourishes, is white as snow: this is pure quartz sand. Below the surface a few inches, where the roots penetrate, the sand is of a grey colour. A specimen of this, dried thoroughly, was found to consist of—

98.5	silicious sand
1.0	vegetable matter
0.5	water
100.0	

It may appear surprising that the cinnamon plant should succeed best in so poor a soil; but, other circumstances considered, it admits of explanation. The garden is nearly on a level with the lake of Colombo, its situation is sheltered, the climate is remarkably damp, showers are frequent, the temperature is high, and uncommonly equable. These are the principal peculiarities to which the excellence of the cinnamon, and the luxuriant growth of this valuable shrub, in a soil so apparently unpromising, may be justly attributed. * * The interior is supposed not to be so well adapted for the growth of the cinnamon as the sea coast; at least, that hitherto brought from thence is coarser and thicker in appearance, and of too rich and pungent a taste. The best description, and that which grows in the gardens around Colombo, and at the other places mentioned, is obtained from what is termed the Laurus Cinnamomum. This is a tree of small size, from four to ten feet in height: the trunk is slender, with a number of branches shooting out from it on every side. The wood is light, soft, and porous, and in appearance resembles that of the common osier. A vast number of roots and fibres run out from the root of the tree, and shoot up rapidly into slender twigs, which form, as it were, a bush around it. The leaf, though not of so deep a green, resembles that of the laurel. When the leaf first appears, it is of a red or scarlet colour, but it afterwards changes gradually to green. The blossom is white, and when in full blow, seems, as it were, to cover the tree in a very beautiful and striking manner. This tree produces a species of fruit resembling an acorn, but not so large, which, when ripe, is gathered by the natives, in order to extract oil from it; this they use for perfuming their bodies and hair, and, when mixed with cocoa-nut oil, it also gives a very pleasant and good light. When

Digitized by Google

the tree is old and decays, it is usually burned down to the ground; the roots are then seen to shoot up again in long straight plants, much better formed than the preceding ones. The bark of these shoots is extremely valuable."

The mode of preparing the bark is thus described:—

"Those who were employed to bark the trees were called Choliahs, and over them were placed officers, whose business it was to superintend the workmen, to take charge of the woods, and to prevent cattle or improper persons from trespassing. The cinnamon was prepared as follows, for exportation. It was the duty of the Choliahs to find out trees of the best quality, which their experience enabled them to do. Such branches as were three years old, and appeared proper for the purpose, were then lopped off with a large crooked pruning knife. From these branches the outside thin coat of the bark was scraped off, with a knife of a peculiar shape, concave on the one side, and convex on the other. With the point of this knife the bark was ripped up lengthwise, and the convex side was then employed in gradually loosening it from the branch, till it could be entirely taken off. In this state the bark appeared in the form of tubes, open at one side; the smaller of which were inserted into the larger, and then spread out to dry. When it was sufficiently dried, the bark was made up into bundles of about thirty pounds weight each, and bound up with thin pieces of split bamboo twigs. These bundles were then carried to the Government stores. It was next sorted according to quality. The best cinnamon is rather pliable, and ought not much to exceed in thickness stout writing paper; it should be of a light yellowish colour; and possess a sweet taste, not so hot as to occasion pain, and not succeeded by any after taste. The inferior kind is distinguished by being thicker, of a darker and brown colour, hot and pungent when chewed, and followed by a disagreeable bitter taste. After the quality had been carefully ascertained, it was made up into large bales, each about four feet long. The weight of each bale at the time of packing up was eighty-five pounds, yet it was marked and reckoned only eighty, five pounds being allowed for loss by drying during the voyage to Europe. These bales were all firmly bound and packed up in coarse cloth, made from coir, the filament which surrounds the cocoa-nut. In stowing the bales in the ship, black pepper was sprinkled among them, so as to fill up the interstices; and by this means not only was the cinnamon preserved, but both spices were improved. * * We hear of Colonial grievances, but, of them all, there is none which appears so urgently to call for attention and correction by the competent authorities in England, as the fiscal rigour with which this important branch of trade, and until lately, in spite of every disadvantage, profitable agricultural produce of Ceylon, has for several years been visited; which has naturally led, I regret to say, to its decay; and, if persisted in, must ultimately prove most injurious to it."

Agriculture would seem, from the Colonel's account, to be carried on among the Kandyan population of Ceylon with primitive simplicity:

"The Kandyan plough is only what may be called a crooked piece of wood, something like an elbow; it merely tears up the ground as unevenly as if it were done by hogs. They then overflow the field with water. They plough twice before they sow; but before they give the first ploughing, they let in water upon the land, in order to make it soft and the easier to be worked. After it is once ploughed, they usually make up the banks; for if they were to put off doing so till after the second ploughing, the soil would have become mere mud, totally unfit for banking. These banks are indispensable, not only as paths for the people to walk upon through the fields, who otherwise must go in the mud, but also to keep in and contain the water overflowing the ground. They make these banks as smooth and level as a bricklayer would a wall with his trowel; for in this respect they pay great attention to neatness. These banks at the top are not above a foot in width. But after the land is ploughed, and the banks are finished, it is again laid under water, and remains so till the time for the second ploughing, when it becomes exceedingly muddy, as much from the trampling of the cattle as from the plough; for the more it is stirred up the better. Sometimes they use no plough the second time, but only drive their cattle through and through the field, until the soil is made sufficiently muddy. The land being thus prepared, it is still kept overflowed with water, in order that the weeds and grass may be destroyed. They then soak in water for a night the corn which they intend for seed. The next day it is taken out and laid in a heap, covered over with green leaves; and thus it remains for five or six days, so as to make it sprout. They then wet it again, and lay it in a heap covered over, as before, with green leaves: and thus it is caused to shoot out its blade and roots: whilst this process is going forward, they have prepared the ground for sowing,—which is thus done: they have a board, as before shown, about four feet long, which they drag over the land by a pair of buffaloes or oxen; not flat-ways, but upon its edge, which is so done, that the earth and weeds may be well mixed together; and it also levels and makes the ground so smooth and even, that the water afterwards stands equally over it. It still remains covered with water whilst the seed is growing, and until it is become fit for sowing, which is in about eight days after it was put into water to soak. The seed being ready, they let off the water, and with boards of about a foot in length, fastened to long poles, they dress the land over again; laying it very smooth, and making small furrows in it, that in case rain or other water should come in, it may drain away; for more water now would very likely rot the seed. They then sow, which they do with great evenness, strewing the seed carefully with their hands. The ground now remains without any water, until the grain has grown three or four inches above it. There had been gaps made before in the banks, to let out the water; these are now stopped up to keep it in; which is not only to nourish the corn, but to kill the weeds; for they always keep their fields as clean and neat as a garden. When the grain has grown about nine inches high, the women are employed to weed it, and to pull it up where it has grown too thick, so as to transplant it to places where it may be wanted. It then stands overflowed, till the grain is ripe; when they let the water off, in order that it may become dry, and fit for reaping. They never, as I before remarked, use manure of any kind; but their mode of ploughing, trampling, and soaking the ground, apparently obviates the necessity for it. The Kandyans are excellent reapers, and as they had assisted each other in tilling the ground, they do so likewise at harvest. They first reap one man's field, and then go to the next, and so on, until the whole of the grain is cut; and their custom is, that every man, during the time his corn is reaping, has to find all the rest with food. The women's work is to gather up the corn after the reapers, and carry it all to one place. When the corn is to be trodden out, (half a dozen buffaloes will tread out fifty bushels in a day), they select a place convenient to their dwellings, where they lay it out around a space about twenty or thirty feet in diameter; from which they cut away the whole of the turf or surface, whatever it may be. They then perform, as Knox tells us, and as I have seen, certain ceremonies. 'First, they adorn the place with ashes, made into flowers and branches, and round circles. They then take divers strange shells, and pieces of iron, and some sorts of wood, and a bunch of betel nuts, (which are reserved for the purpose), and lay all these in the very middle of the part, and a large stone upon them. Then the women, whose work it is, bring each their burthen of reaped corn upon their heads, and go round the pit three times, and then fling it down. After this, without any more ado, they bring in the rest of the corn as fast as they can. For this labour, and that of weeding, the women have a fee due to them; that is, as much corn as shall cover the stone, and the other conjuration instruments, at the bottom of the pit.'"

With these extracts we dismiss Col. Campbell's volumes—and without regret.

The Works of Montaigne. Edited by W. Hazlitt.

[Second Notice.]

Our return to this book is occasioned by the circumstance that it presents the first English version of the Travels of the great essayist, a narrative pregnant with interest, and evincing the same fresh and vigorous understanding, the same philosophy of common sense, which has set the signet of immortality upon the principal work of the same writer. Perhaps M. de Querlon, the original French editor of these Travels, goes something too far when he says they make Montaigne better known to his readers than the Essays themselves; but it is certain that we have here a chapter of his actual history, an autobiography of seventeen months of his existence, and we are to a certain extent saved the trouble of collecting the scattered traits of character, and arranging them, with some mental effort, into a picture of the man. M. de Querlon considers the variety of opinions that have been formed of Montaigne, a proof of the insufficiency of the Essays to determine his true character with precision. We believe that Montaigne himself, could the judgments of his numerous conflicting critics have been laid before him, would have acknowledged the correctness of most of them, notwithstanding their seeming incompatibilities, so thoroughly conscious was he of the variableness of the human mind, and the inconstancy of human conduct, a theme on which he loved to dwell, always illustrating it from his own stores of self-knowledge.

At any rate, in Montaigne's journey we have Montaigne again, with all his health of mind, all his benignity, all his variety, all his acuteness, all his simplicity, all the youthfulness and genuineness of his feelings. He is the same agreeable egoist, the same inoffensive aristocrat, the same good-natured gentleman, the same charming companion. We find him possessing every quality that a traveller should have, with the exception of good health, for in him was the *sana mens* though not *in corpore sano*. His journey is the diary of an invalid, but his bodily pains neither sour his temper, nor deaden his sense of beauty or his enjoyment of society. If there is more than is pleasant to hear about perspirations and dyspepsia and the colic, the reader who is curious on the now popular subject of hydropathy will find ample compensation in the minute details of the various baths in Switzerland and Italy with whose waters, lucid or muddy, Montaigne deluged himself within and without, with a passion for ducking and drenching worthy of Priessnitz himself. If ever there was a man who loved to shake off the fetters of authority, and to think and act for himself, it was Montaigne, than whom the world had never a freer citizen. His opinions are not more of his own forming than his routes of his own choice. He takes the road through the Tyrol, undeterred by the alarming accounts given him of execrable inns, impracticable mountains, and an eternal winter. His sweetness and good-humour smooth the roughest passes of the Alps better than Hannibal's vinegar. Arrived at Brixen he finds it charming, and his reflections are thus given by his secretary, who is the writer of the early portion of the journey, which accounts for Montaigne being spoken of in the third person:—

"He had all his life been very chary of taking other people's judgments as to foreign countries; the tendency of most men being to test the merits of what they see, by what they have been always accustomed to see in their own neighbourhood. He had therefore paid but very slight attention to the accounts he had heard of different places from different travellers; but he said, when he came to this place he wondered more than ever at the obstinate imbecility and narrow-mindedness of such people; for he had always been told that the passes of the Alps in this part of the country were full of danger and difficulty, that the manners of the people were wild and uncouth, the roads impassable, the inns altogether savage places, the climate insupportable; whereas, for the climate, thank God, he had found it exceedingly mild, inclining rather to [illegible]

Digitized by Google

excess of heat than an excess of cold. That in all other respects, if he wished to take his daughter, a girl of only eight years old, on an excursion any where, he would quite as readily trust her upon these roads, as in one of the walks of his garden. As to the inns, he had never been in a country where they were handsomer, more numerous, and more plentifully provided with wines and provisions of every sort, and he had never met with such excellent accommodation at so cheap a rate."

Montaigne fortunately was no Apicius. The palate of a traveller ought not to be over-exquisite, for the best *cuisines* are not to be looked for in alpine valleys, or on the way-side through any country in the world. Even when he pronounces an inn indifferent, he generally adds that he found "plenty of provisions"; and in truth it not often happens in any civilized country that a tourist can miss a tolerably good dinner, if it is not his first object to find one. Montaigne, however, was "assez friand de poisson," and he always mentions the kinds of fish set before him, and often the modes of cooking them by his Swiss and Italian hosts.

Montaigne had the invaluable faculty of winking at the petty inconveniences and *désagremens* incidental to tourists, while his eye was for ever open and vigilant to discover something pleasing and commendable in every scene and object. Upon one occasion his secretary writes:—

"The journey was to him a source of entire delight. When, after passing a restless night, he in the morning called to mind that he was going to visit a town or a place he had never yet seen, he would leap out of bed as gay as a lark, and as light, and meet his friends in the highest spirits."

Montaigne seems to have paid especial attention to matters connected with religion, and certainly evinced no partiality towards the professors of the reformed faith. A little incident at Baden exhibits the way in which the religious strictness of the Protestants revived the same spirit in those who still adhered to the old creed:

"On Wednesday, his landlord bought a very large quantity of fish; and when M. de Montaigne asked him why he did so, he replied that the great majority of the people at Baden ate fish on Wednesdays out of a religious feeling: which confirmed what Monsieur de Montaigne had heard before, that those who there hold the Catholic faith are made the more strict and devotional by the existence of the rival religion."

At the same place Montaigne conversed with a minister of Zurich, and we collect from the colloquy that these early pastors of the reformed church had the good sense not to perplex their flocks with doctrinal subtleties:—

"To-day he got into conversation with a minister of Zurich, a native of that place, who had just arrived; and he found that their first reformed religion had been Zuinglian: from which they had approximated to that of Calvin, a somewhat milder form. When this minister was asked about predestination, he replied that they themselves held a mean between Geneva and Augusta, but that they did not embarrass their flocks with the dispute. In his own particular judgment, he rather inclined to the extreme doctrines of Zuinglius; of which he proceeded to make a high eulogium, saying he considered them to approach the nearest to the primitive Christianity."

At Constance he found "a great many Lutherans," and he undesignedly accounts for this circumstance in the following striking account of the beauties of the ancient religious *régime*:

"The bishop, who is a native of the country, and a cardinal living at Rome, derives a revenue of full forty thousand crowns from this see. There are canonries, in the church of Notre Dame, which are worth fifteen hundred florins a-year, and are held by lay gentlemen. We saw one of these on horseback, coming out to take the air, gallantly equipped in the military style. They say there are a great many Lutherans in the town."

At Linde, or Lindau, he found the Catholic priest monopolizing the revenues, and the Protestant minister engrossing the cure of souls, a spectacle which, *mutatis mutandis*, is to be seen in our own days, in places not so remote as Lindau. At the next town he discusses with a Lutheran minister the differences between the Lutherans and Calvinists on the subject of the Lord's Supper, and Montaigne thought "the doctor made out but a poor case." He then goes on to a place called Kempten, where there were no Catholics but the monks, yet the Catholic service continued to be performed with all pomp and ceremony, which Montaigne, Catholic as he was, considered a "strange" thing. The fortune of the Abbot, and the gentility of the monks, had probably some influence in depopulating the Catholic fold so utterly. Here, too, Montaigne had an interesting dialogue with the Lutheran pastor, which we cannot avoid quoting, as a proof of the superiority of the Lutherans, in point of liberality, to the other Protestant sects, and as an illustration, also, of the intense hatred which they bore to the Calvinists and Zuinglians:—

"To the question:—'Whether they permitted dancing?' the minister replied 'Why not?' To another question: 'Why on the windows and in the decorations of the new organ, they had painted representations of Jesus Christ and other scriptural subjects?' he replied 'That they did not prohibit images which were merely for the purpose of instructing men; all they forbade was the worshipping of them.' To the rejoinder, 'Why, then, had they removed the old images from the churches?' he replied: 'That it was not they who had done so; but that their worthy disciples, the Zuinglians, incited by the evil spirit, had committed this outrage, as well as several others;' which was the same reply that others of the same profession had already made M. de Montaigne; and in particular, the divine at Isne, who when he was asked, 'Whether he hated the figure and emblem of the cross?' exclaimed: 'How! do you imagine me such an atheist as to hate an emblem so dear and glorifying to all Christian souls?' adding: 'that such a thing would be perfectly diabolical.' The same person declared very roundly, when at dinner, that he would rather hear a hundred masses than participate in one of Calvin's sacraments."

Montaigne sometimes combines his remarks on the state of religion with observations on the statistics of beauty. For example at Augsbourg,—

"The ministers do not derive any revenue from their churches, but are paid by the senate. There was a far larger crowd in this one church than in two or three of the Catholic churches put together. We did not see one pretty woman here."

He found the intermarriages of Lutherans and Catholics events of daily occurrence, and it would appear that one creed or the other made a proselyte at every nuptial ceremony. We are told how the question of faith was settled between the enamoured parties, and it appears that Cupid, upon such occasions, acted the part of a doctor of divinity, and should have been painted with a shovel-hat.

At Augusta, Montaigne heard of a very useful bishop:—

"They say at Augusta that they are free, not from mice, but from the large rats which infest every other part of Germany; and they attribute this exemption to one of their bishops, who lies buried here; even the earth round his tomb, they say, has the power of expelling these vermin wherever it is carried, and they sell little bits of it, about the size of a nut, for this purpose."

In several of the Bavarian towns Montaigne saw proofs of the success with which the government of that state resisted what he calls the "contagion" of the Reformation. At Landsberg, he tells us, "the Count of Helfenstein commands at the castle. If any one even dreams of any other religion than the Roman, he had need keep it to himself." It appears that the Jesuits, whom Montaigne highly extols, had great influence with the reigning Duke, and were sagaciously exerting it to put down those prominent irregularities in the lives of the clergy, which had generally contributed so much to excite popular feeling against the Church of Rome. Of this a striking instance is recorded:—

"Kinief, six leagues; a miserable little village in the same duchy. The Jesuits, who have great influence in the government of affairs in this country, have been making a grand movement, which has drawn upon them the hatred of the people, for the purpose of forcing the priests to dismiss their concubines, under great penalties. From the degree in which the priests are sympathised with on this occasion, it would seem that formerly the practice thus invaded was so generally tolerated that it had come to be regarded as perfectly legitimate; and the whole community are at this moment engaged in getting up remonstrances to their duke, in behalf of the priests."

Subsequently, at Rome, he makes the following remarks upon this celebrated order:—

"'Tis amazing what a position this society has attained throughout Christendom; never, I believe, was there any community amongst us that ever occupied so high a place, or that ever produced such immense effects as these will do, if their plans are not interrupted. They occupy well nigh all Christendom, and daily send forth from amongst their body, great men in every class of greatness. It is the part of our system which threatens the greatest danger to the heretics of our time."

Montaigne's reflections on the remains of ancient Rome are those of a philosophic observer and profound thinker. We have only to regret that the characteristic "I" is wanting in the passage:—

"He observed: 'that there is nothing to be seen of ancient Rome but the sky under which it had risen and stood, and the outline of its form; that the knowledge he had of it was altogether abstract and contemplative, no image of it remaining to satisfy the senses; that those who said that the ruins of Rome at least remained, said more than they were warranted in saying; for the ruins of so stupendous and awful a fabric would enforce more honour and reverence for its memory; nothing, he said, remained of Rome but its sepulchre. The world, in hatred of its long domination, had first destroyed and broken in pieces the various parts of this wondrous body; and then, finding that, even though prostrate and dead, its disfigured remains still filled them with fear and hate, they buried the ruins itself; that the few indications of what it had been, which still tottered above its grave, fortune had permitted to remain there as some evidence of the infinite greatness which so many ages, so many intestine and parricidal blows, and the never-ending conspiracy of the world against it, had not been able entirely to extinguish; but that in all probability, even the disfigured members that did remain, were the least worthy of all those that had existed, the malignant fury of the enemies of that immortal glory having impelled them to destroy, in the first instance, that which was finest and most worthy of preservation in the imperial city; that the buildings in this bastard Rome, which the moderns were raising upon, or appending to, the glorious structures of the antique world, though they sufficed enough to excite the admiration of the present age, yet seemed to him to bear a close resemblance to those nests, which the rooks and the swallows construct upon the roofs and walls of the churches in France, which the Huguenots have demolished. Nay, when he considered the space which this tomb occupies, he feared that the real extent, even of that, was not known; he doubted whether the greater portion of the grave itself had not been buried; it appeared to him that the enormous pile which, years ago, was formed merely of such miserable diggings-up, as bits of tiles and broken pots, a pile which had attained the height and size of many natural mountains (for he considered it to be as high as the hill of Gurson, and twice as large), was an express ordinance of fate to let the world thoroughly understand, by this strange and amazing proof of grandeur, how surpassing was the glory and pre-eminence of the city against which they had conspired. He said he could not at all comprehend, when he saw the limited space of some of these seven hills, especially the most famous, such

Digitized by Google

as the Capitoline and the Palatine, how they could have held so great a number of buildings as have been ascribed to them. Merely looking at the Temple of Peace, the site of the Forum Romanum, the ruins of which look like a mighty mountain, just fallen asunder, he could hardly understand how two such edifices could stand even on the whole space of the Capitoline-hill, yet, besides these, there were on the hill twenty-five or thirty temples, besides a number of private houses. But, in truth, many of the conjectures which one has formed from pictures of the ancient city, are not at all borne out, when you get there, for even the site has undergone infinite changes; some of the valleys are filled up, even the deepest of them, such, for instance, as the *Velabrum*, which, on account of its lying so low, was selected as the main sewer of the city, and formed a water-course, even this has now become as high as the other natural mountains which surround it, and this has solely been done by the gradual agglomeration of the ruins of old Rome; so, the *Monte Savello* is nothing but the heaped-up ruins of part of the theatre of Marcellus. He fully believed that an ancient Roman, could one be brought back, would not be able to recognize the place. It has more than once happened that, after digging a long way down the workmen have come to the top of some high column, which still remained standing on its base far beneath. The modern architects never think of looking for any other foundation for their houses than the tops of old buildings, the roofs of which ordinarily form the floors of modern cellars, deeming it in no way necessary to make any examination as to the foundation of the old edifice itself, or the stability of its walls; they securely base their own structure upon the ruined tops of the structure below, just as chance has happened to dispose them during the lapse of ages, and here they raise their modern palaces, as firm and as safe as though the foundations were solid rocks. There are many whole streets, that stand above the old ones, full thirty feet.'"

He visited the Vatican, but need not have told us, "I especially noticed a Seneca and the Opuscula of Plutarch!" None acquainted with the Essays would be at a loss to guess the books that would first arrest the attention of Montaigne. He also observed, with interest, "the original of the book that the King of England (Henry VIII.) wrote against Luther, and which he sent to Pope Leo X., subscribed with his own hand." Montaigne pronounces the work of the royal author to be "written in good scholastic Latin."

At Ostia he noticed the towers built by the popes at intervals along the coast, to prevent, by the rapid communication of alarm, the descents of Turkish corsairs, particularly during the vintage.

He was an eye-witness at Rome of a procession of Flagellants, and gives the following striking account of it:—

"Between the ranks, walked a file of penitents, who every other minute whipped themselves with cords; there were five hundred of them, at least, whose backs were torn and bleeding in a frightful manner. This part of the exhibition is a mystery I have not yet been able to make out; they are unquestionably most terribly mangled and wounded, yet, from the tranquillity of their countenances, the steadiness of their motion and of their tongue (for I heard several of them speaking), you would have formed no idea they were engaged even in a serious occupation, to say nothing of a very painful one, and yet many of them were lads of but twelve or thirteen years old. As one of them, a mere child, with an exceedingly agreeable and unmoved countenance, was passing just close to where I stood, a young woman near me uttered an exclamation of pity at the wounds he had inflicted on himself, on which he turned round and said, with a laugh: *Basta, disse che fo questo per li lui peccati, non per li miei.** Not only do they exhibit no appearance of pain, or of being reluctant thus to mangle themselves, but, on the contrary, they seem to delight in it; or, at all events, they treat it with such indifference that you hear them chatting together about other matters, laughing, running, jumping, and joining in the shouts of the rest of the crowd, as if nothing ailed them. At certain distances, there are men walking with them, and carrying wine, which they every now and then present to the penitents; some of whom take a mouthful. They also give them sugar-plums. The men who carry the wine, at certain intervals, moisten with it the ends of the penitents' whips, which are of cord, and get so clotted with gore that they require to be wetted before they can be untwisted. Sometimes the wine is applied to the sufferers' wounds. From the shoes and the breeches worn by these penitents, it is easy to perceive that they are persons quite of the lower class, who, at all events the greater number of them, let themselves out for this particular service. I was told, indeed, that the shoulders were protected by some flesh-coloured covering, and that the appearance of the blood and wounds was artificial; but I was near enough to see that the cuts and wounds were quite real, and I am sure that the pain must have been very severe; and, besides, where is the merit of these penitential exhibitions, if they are merely a trick and imposition?"

But the whole account of his sojourn at Rome is animated beyond measure, and abounds with curious incidents, related with vivacity and interspersed with strokes of the observer's peculiar humour and deep reading of society and manners. Rome had for Montaigne greater social attractions than any city he had ever visited. He says,—

"One of the great advantages of Rome is, that it is one of the least exclusive cities in the world; a place where foreigners at once feel themselves the most at home; in fact, Rome is, by its very nature, the city of strangers. Its sovereign is sovereign also over entire Christendom; his jurisdiction generally subjects to his authority all Christians, wheresoever they are, even in their homes in the most distant countries, as much as in Rome itself; and as to all the princes and grandees of his court, the consideration as to whence they came, is of no sort of weight."

In another place he remarks—

"The city is nothing but court and nobility; everybody in it participates in the universal tone of ecclesiastical idleness. There is no trading street to be seen, except, perhaps, a small one or two in the suburbs: there is nothing but palaces and palace-grounds. They have no Rue de la Harpe or Rue St. Denis here; I was reminded of nothing at Paris but the Rue de Seine, or the Quai des Augustins. There is hardly any difference discernible between a holiday and a work-day; all the week through there is something or other going on, in the way of festival or show, and as great a crowd of spectators on one day as on another: the whole population seems made up of prelates, nobles, and ladies riding about in carriages, and forming processions, and of idle sight-seers looking at them."

While he remained at Rome his Essays were submitted to the censorship, and he informs us of the objections taken to parts of them; for instance, the apology for the Emperor Julian. He was treated, however, not only with the greatest lenity, but with the utmost respect:—

"On the 15th of April, I went to take leave of the *Maestro del Sacro Palazzo* and his colleague, who begged me to pay no attention to the censure of my books, which, they told me, several Frenchmen had since informed them, exhibited very great ignorance and imbecility; they assured me that they held in high honour and esteem my intentions and my ability; and that they had no doubt of my affection towards the church; adding, that they had such confidence in my conscientiousness and candour, that they would leave it entirely to myself to omit or correct, in my book, when I wished to reprint it, what I should, on consideration, think too free-spoken; and they referred me, among one or two other points, to my treatment of the word fortune. I thought they seemed very well pleased with me."

These travels impress us with a belief that Montaigne was in heart a truer son of the Church than some of his commentators have supposed. He seems to have taken a lively interest in every effort made by the Catholics to check the torrent of dissent; and if the homage he paid at the shrine of Loretto is not to be received as a demonstration of true devotional feeling, it proves at least the profound respect with which Montaigne was in the habit of testifying for the rites and traditions of his Church, even those most strongly marked with the traits of superstition and absurdity. He received the sacrament in the chapel of Loretto, and added a costly votive offering to the numerous treasures of the sanctuary.

We must close here, although we would willingly extend our extracts, for we are acquainted with no picture so lively of any country in Europe in the sixteenth century as Montaigne has left of Italy in this journey, not to mention his scarcely less interesting account of the scenery and society of Switzerland. There is certainly (as we have remarked before) too much about the colic and dyspepsia, and too much even about bathing, which seems to have been as furiously practised in the days of Montaigne as in ours, particularly by the Germans. We would leave these parts of the book, or the bulk of them, for the meditation of hydropathists, and suggest an edition of this most attractive personal narrative, disencumbered of these unpleasant superfluities, for it only wants a few judicious omissions to become one of the most charming books of travels in any language.

The President's Daughters; including Nina. By Frederika Bremer. Translated by Mary Howitt. 3 vols. Longman & Co.

WHEN we noticed Miss Bremer's tale of 'The Neighbours' we expressed a hope that success might tempt Mrs. Howitt to give us the remainder of the Swedish lady's novels; and here we have 'The President's Daughters,' with a promise of others, if the translator be not unfairly anticipated by those who love, as she says, "to hunt other people's literary hares."

'The President's Daughters' is a worthy companion to 'The Neighbours'—simple and truthful; and though we may never have met elsewhere any one of the characters, all who have ever looked deeply into their own hearts will claim kindred and acquaintance with them. There is not one that offends by exaggeration—not one that is not recognized at a glance by the humanities of our common nature—they are creatures of flesh and blood, and walk the stage of life as it has been trod for ages, and will be trod for ever. No impossible vice, no superhuman virtue, startles us in Miss Bremer's page: we recognize in her heroes and heroines men and women with whom we ourselves could have lived and been happy. 'The President's Daughters' contains little or no plot; the characters are thrown into various situations, and placed under various influences, in order that the effects of circumstances and influences on human character may be shown to us. The heroines (for there are several) are of characters as diverse as could well be drawn, and yet each perfect in its way. Among the most noticeable are the President's daughters—the gloomy Edla, to whom alone, of her family, Nature has been a stepmother—the light-hearted, joyous Adelaide, the personation of feminine gentleness and goodness, self-devoting, yet self-willed, full of life and energy, yet with a calm, well-balanced, intellectual mind—the twin sisters Mina and Nina, of whom Nina survives to be the heroine of a great portion of the story as the meek, quiet maiden, depressed in a mysterious manner by the loss of her twin sister, living under the guardianship and maternal care of her elder sister Edla, who tries to strengthen her naturally yielding temper, and yet repels her by a severity uncongenial to her loving spirit,—born only to

* 'Pshaw: tell her I'm not doing this for my own sins, but for hers.' Montaigne's Italian is never the most correct in the world."

Digitized by Google

love and be beloved, and yet strangely thwarted, and finally sacrificed, to one whom she loves not: yet these form only a few of the characters, who might each and all set up a claim to be *the* heroine. Early in the story we are introduced to an enthusiastic young artist, Angelica, whom we shall at once introduce to our readers. Angelica has been rhapsodizing on the subject of genius:—

"'Who is the happy, the great, the enviable, on earth? Is it not he who gives to human nature that enlightened beauty which he drew from its breast; who, borne upward by his genius, ascends to heaven to fetch thence fire with which he will kindle the nations? A human life—a little human life—a life of a few years—and to live in this for an immortality—to breathe fire into the hearts of millions of human beings—a human life—so little and yet so vast! How wonderful! How glorious! How sweet the lot to live for a world and to die for the immortally beautiful on earth! O that it might be mine!' Tears of ardent longing streamed down the now glowing cheeks of Angelica. 'Is it for renown?' asked Count Alarik, with a searching glance. 'And would this renown make you happier, Angelica?' inquired the elderly lady with the gentle countenance; 'would it here make you more beloved by your friends? would you actually, with all this striving for millions, make one human being happier? O Angelica! is there, indeed, a nobler lot on earth, a lot which is more worthy to be striven after by a woman's heart, than that of being the whole and entire happiness of one being?' Angelica looked first at one and then at the other of the speakers; a cloud dimmed her brow, but it quickly passed, and she said to Count Alarik, 'No, not for the sake of renown. If I should ever succeed in producing a masterpiece, and time, or the hand of an enemy should efface my name from the picture, I would not complain if the work of my hand and of my spirit lived only for mankind.' To the elderly lady she said, with a low voice and a look of humility, 'I do not know whether I should be happy; I only know one thing, that I must obey the voice which requires from me that I should strive after the immortal in art. God must dispose my fate as He sees best!' And have you weighed, asked Count Alarik, advancing towards her, 'all the difficulties of your path? General opinion, poverty, your sex, which prevents the acquisition of a grounded knowledge—all, all will retard your steps. Listen to wiser counsel, Angelica. Direct yourself according to the taste and the circumstances of the times. Do not strive to attain to the ideal; paint portraits, little scenes out of every-day life, and you will become rich, will live tranquil, loved, and esteemed.' 'I can endure hunger,' said Angelica calmly and fixedly; 'and the censure of the world I do not hear; it would be overpowered by a mightier voice within my own breast. Striving after the highest only will I live!' 'And if you should fail? if you should be deceived in your own powers?' 'Then may God be merciful to me, and let me die!' 'And wherefore this ambition? A less degree of perfection also gives joy, and the good and the beautiful live also in the humbler spheres of life, and there are they more accessible.' 'The highest! the highest!' exclaimed Angelica; 'I will live and die striving after the highest!' 'You have the true artist-soul,' said Count Alarik."

Angelica afterwards becomes the pet of a patronizing Countess, and dies young at Rome, leaving behind her one immortal work. "Angelica lived not in vain. And who that has striven ardently, and laboured honestly, has lived in vain, if it be only for a brief morning hour?" The following sketch of various classes of women is drawn to the life:—

"Some amongst us there are to whom life has been a rough soil; they go through it without being loved, and, what is worse, without being able sincerely to love any one. The frostiness of the air around them chills the warmth in their breasts; they become bitter and hard; and as they can produce no flowers, they turn themselves into rods. They cannot leave virtue and beauty at peace, and they quarrel with beauty and weakness. Let us hope that by the light of a more friendly sun, the tree of their life shall put forth new buds, and that they shall receive and give forth gladness. Others there are, and they are many, whom nature has liberally provided for; they are good and amiable; they love virtue; but the world and temptation, unwise counsellors, and their own hearts' weakness, make them fall. The best heart becomes soiled by unworthy desires and low pleasures. Fallen angels! many are there among them who weep bitter tears over the grave of their own innocence, and these may one day arise in renewed virtue. Others there are who overlay its loss with flowers and mirth; over these weep the angels of heaven. Many others are there also whom nature and fortune made for temptation, but friendly stars have kept watch over them. Their hearts were early attached by a pure love, and a protecting home closed around them like a Midsummer bower. Their joys and their sorrows are alike innocent, and all their intercourse with their fellow creatures is peaceful. No one hates them, and, what is more tranquillizing, no one loves them more or differently to what the Gospel permits. They live loved and honoured, and general opinion calls them patterns and examples. But these quietly happy ones, these untried ones, how often do they pass heavy judgments on those who, in an atmosphere different to their own, have frozen their hearts, or scorched their wings. They fancy that they have a right to despise them; and yet it is possible, after all, that they are in no way superior to them, except in being happier. Others also are there, thank God!—and my heart warms in thinking that I know and love such—who, neither step-children nor favourites of nature and fortune, tempted or not tempted by life, resemble each other nevertheless in this, that they never let anything dim the celestial mirror in their souls. Pure themselves, and hating all evil, yet they pity and pardon those who sin. A heaven of pure compassion lies in their glance, and through it only does the guilty one read his judgment. Good, true, wise, patient, affectionate, they do not permit themselves to be disturbed by human weakness or severity: they go tranquilly on their way; they have a light within them that guides them, and that warmly, beneficently beams around them. They understand how to compassionate those sorrows they have themselves never felt; and when they suffer, they can yet smile joyfully on others. Like the bird of paradise, they hover onwards over the earth, without disfiguring their wings with its dust, and by their loveliness they entice others to follow on their heavenward flight. And now back again——well! but I had nearly forgotten the fifth and most populous class of women, and thus, with them, nearly shut myself out of the creation. I do not know how better to designate them than as 'the harmless.' We, its members, are as numerous as the potatoe, and come, like it, all over the world. We are the world's household fare, and the world would go on badly without us. We fill the room, and yet deprive nobody of a place; we neutralize the warring elements of life, which without us would destroy one another. We are produced by the *juste milieu*, and this our element we seek to diffuse over the world. We call exultation folly, and Sappho a mad-woman. We go to church and to the opera, and don't wish to be much noticed. We take from life exactly what life will give us, and are contented; we put our houses in order, salt our meat according to established rule; speak moderately good or ill of our neighbour, think only as much as is necessary, and beat down the price of every thing that is much prised or greatly in demand—in one word we are what are called 'equal people,' and keep the world in equipoise. We sing best this good song—

Trallala, trallala, tralla, trall;
Trallala, trallala, trallom!"

The following scene between Adelaide and her betrothed will give the reader an insight into the character of both:—

"When these amiable women were gone, Count Alarik said: 'The impression made by personal beauty, is generally acknowledged; I am the last who would wish to deny the beneficent influence of beauty on the mind, its bewitching power on the heart. But what works equally with this, and deeper and more beneficially, are the qualities we have just had an opportunity of admiring in Mrs. L. and her daughters. That fine proportion in the development of the powers of the soul, that clear understanding, that precision and order in the expression and delivery of opinions which instantly make them comprehensible and clear, these make on me an impression, equal to that of beauty; this colouring of the soul, it is true, reveals itself slower, but at the same time it is not so perishable as that of the body.' And so saying he looked at Adelaide, whose beautiful under-lip pouted pettishly. 'To be very beautiful is a temptation,' continued Count Alarik. 'One is so easily led in youth to think that in one's appearance one possesses a treasure, rich enough to give happiness to a whole life. The world moves so joyfully, so pleasantly for the young beauty, so that it is difficult for her to seize the seriousness of life.' 'And why this seriousness, why must it be so important to seize it?' asked Adelaide. 'Because a human being is called to something more than being merely a flower or a butterfly; as such, it is possible to please, to charm, to call forth approbation; but never esteem nor true love.' Adelaide looked oppressed, and tears rose to her eyes. 'Life is so pleasant!' said she. 'God has given us joy and life; why shall we not enjoy his gifts? Ah, let us, let us be joyful!' 'Life has higher and weightier interests,' said Count Alarik with deeper earnestness, 'and which but ill agree with a thoughtless enjoyment of its passing pleasures.' 'There are,' said Countess Augusta, 'weighty and important duties to be performed; man must not live for himself alone——' 'What do you mean, then,' asked Adelaide earnestly, half anxious, half laughing, 'with your importance and your duties? Is it something out of the Roman history that one must resemble, to be a human being?' * * Count Alarik looked at her with an extraordinary emotion. She stretched her hand to him with the most engaging charm, and said: 'Let me be glad in life and in death! God is good; he intends good to us all in joy as in sorrow; why should we not be glad? Let me not see this gloomy seriousness!' Count Alarik did not answer; he pressed the snow white hand to his lips, followed Adelaide with his eyes during the whole evening, but remained silent and thoughtful. Adelaide was grave for a moment, but soon returned to her usual liveliness, and laughed, sung and played with the little ones."

The description of a Swedish spring, and its awakening influence on nature and on man, is a pleasant and life-like picture:—

"It is spring in the north, and all the town-dwellers are bidden as guests to the rural festivity. Veronica and Stellaria embroider the splendid cloth which covers the festive table, the mid-day torch is lighted, the bird with its melodious sighs—'the wandering voice,'—and the lark with its joyous song calls out to the rich woods, to the sunny field; they sing: 'Come, come! Glorious is life in the country!' And the town-gates open, and an innumerable multitude stream out from the confined to the free. Here we see the family calèche with papa and mamma, and little sons and daughters placed amongst the bundles and packets; there the more modest gig, with the father and mother, and the little one who sits squeezed between them; here the stately landau with the 'Marshal of the Court,' the Countess, and the parroquet—where are they all going? To the country—to the country! to estates, and country-houses, orangeries, conservatories, dairies, distilleries, etc. etc. etc. Who can count all the bobbing chaises which carry hungry men ready for dinner out to the inns in the fields? What healths there to the memory of Bellman!* Let us see the foot passengers who wander out of the gates of Stockholm to enjoy life in the beautiful scenery around. Here we have a respectable family of artisans, who go to spread their cloth on the green plots of the Djurgärden; here a couple of lovers who go to pick forget-me-not, and to write their names on the leg of a statue in the park near Drottningholm.† See that elegant family party! ladies with parasols, and gentlemen in frock coats, standing with bunches of lilac in their hands round the great urn at Rosendal, peeping and wondering if the royal family will appear! If you wish to see more finished or more witty sketches, seek for them in Count Hjalmar

"* A favourite comic poet, and writer of comic songs, died in 1769.—M. H."

"† A palace in the lake Mälern, near Stockholm. The summer residence of the Crown Prince, and Princess of Sweden.—M. H."

Mörner; but yet a few more hasty contours of the friendly scenes of spring. Young girls dance with light feet out in the fields, forget all the vanity and show with which their town life had infected them, and flowers amongst flowers, they become simple, beautiful, and faultless as they; they form friendships, they bind wreaths, they praise God, and are happy. Young men swarm out among the woods, the winds, and the waters—the strength, which is streaming through nature, enhances the life in their bosoms; they think the whole world is theirs, every rosy tint of morning, every golden evening cloud, writes for them a promise of victories and glory. And the aged—they go out, supported by the arm of a son, oftener by that of an affectionate daughter, oftener yet perhaps by a crutch; they go out to warm themselves in the sun, to sit on a bench, and hear the song of the birds, and breathe in the fresh air, to rejoice themselves in the sun; the more fortunate amongst them to rejoice themselves in their grandchildren's joy. And the children, the children! O ye little, soft, beautiful, innocent beings, favourites of God and men, the spring seems shaped for you, and ye for the spring; when I see you amongst the flowers, with bright butterflies dancing around you, I wonder what the higher world can yet have lovelier."

These extracts will probably tempt many among our readers to share the pleasures we have felt in reading this pure and truthful record of human life and character. And we shall only add, in justice to Mrs. Howitt, that the translation is, with few exceptions, elegant and easy,—certainly an improvement on her version of 'The Neighbours.'

Tecumseh; or, the West Thirty Years Since: a Poem. By G. H. Colton. New York, Wiley & Putnam.

WE cannot promise Mr. Colton's romance in rhyme a very extensive popularity on this side the Atlantic. Like the 'Yanwyden' of Messrs. Eastburn and Sands, and the 'Zophiel' of Mr. Brookes, it is too diffuse—spreads over too great a surface. There are, probably, few works more creditable to Transatlantic imagination than 'Zophiel'; but though Southey earnestly recommended it to public attention, by whom is it read, or to whom is it known? 'Tecumseh' will, we fear, share the same fate; and yet neither Bryant, nor Percival, nor Sprague, nor Halleck have written anything, of its kind, much superior to the following:—

The Lament.

Where is the foam of the waters?
White on the golden sand it shone:
But a wave from the deep came dark and high—
I looked and the foam was gone!
It might not linger!

Where is the snow-wreath of winter?
Pure in the forest depths it lay:
But the Great Spirit looked from the stormless heavens,
And the snow-wreath passed away
In its own breathing!

Where is the cloudlet of summer?
Palely it slept on the sky's calm breast:
But the winds blew strong and the tempest rose—
The cloud found a darker rest,
No more returning!

Lovely wast thou, my sister,
Gentle and sad as the night's cold breath!
Ah! if thou hadst been less sweet and fair,
Thou wouldst not have charmed cold death
Nor grieved Omeena!

Vain is the voice of my sorrow!
Never again to the earth nor me
Thy spirit returns from the Shadowy Land:
And with tears shall I gaze, like thee,
On stars and flowers!

Yet will I cease from my mourning,
Child of the moon-lit Ocean-foam!
For a captive, and orphan, and lonely in woe,
Manitto hath called thee home,
To meet the long lost!

Soon may I come to thee, dearest!
Sorrow and tears and the tomb are not there,
And the flowers have no fading, the storm never comes,
And joy fills the boundless air.—
Sleep, sleep, thou dreamless!

Other passages might be quoted of equal merit.

DAYS' EXCURSIONS OUT OF LONDON.

Chiddingstone and Hever.

THE Dover line of Railway, traversing the whole weald of the ancient kingdom of Kent, is rich in materials for Days' Excursions, both historic and picturesque, and the Directors of the Company seem fully alive to this feature of their railway, and to its employment for other purposes than those of mere necessity. An attractive placard now decorates the "external paper-hanging stations" of the metropolis, announcing to its smoke-dried passers-by, that the Dover railway line is the "line of pleasure," and each station is made to proclaim the possession of some tempting curiosity, in abbeys, castles, mansions, parks, &c. Besides whetting the appetite for fresh air, the country, and its beauties, this Company, with a good judgment almost peculiar to itself among the metropolitan railways, diffuses the means of reaching them most extensively by its very cheap fares. Instead of making the cheapest mode of conveyance almost useless in consequence of the times of departure—an arrangement in which the Great Western, the Birmingham, and South Western Railways, obtain an ungracious pre-eminence—and as uncomfortable as possible, the Dover Railway, to its credit, causes its third-class carriages to start at all hours of the day, and also makes them comfortable. Well provided with roomy seats, and a bright sun over head, the third class carriages are delightful; but do not subject yourself in them to rain—made mercilessly penetrative by rapid motion. The fares on this line are cheap by all its carriages. In the third class you may reach Tunbridge, a distance of about forty miles, for half a crown, and Penshurst, the station at which the present day's tourist will deposit himself, for one shilling and ten pence! Not to withhold credit where due, we should acknowledge that the Brighton Railway Company has seen the error of its ways, and recently regulated both its fares and general arrangements, after the good example of the Dover company. But owing to the extortion of the Greenwich Railway, third-class passengers are not brought into London, and only to New Cross station. To travellers from the west end of the metropolis, there is no inconvenience in this—passengers for every train are conveyed from Cockspur Street and Gracechurch Street to the New Cross station for sixpence. When we have uttered a lamentation at the dire necessity which compels us on this line to pass through two long tunnels, at Merstham and Godstone, which only the first-class carriages make less intolerable, we have told the tourist all that we think necessary relating to the travelling department of his day's excursion.

In about an hour and a half, we arrive at the Penshurst station. If unable to manage a walk of nearly seven miles, then stop at Edenbridge, the station before Penshurst, where a carriage may be hired. From Penshurst station we ascend a deliciously shaded lane which separates the grounds of Redleaf from the park of Penshurst. It is a lane well worth all the journey to behold and saunter in: and the stout rustic cottages erected by Mr. Wells in the lane make us long for the privilege of seeing further evidences of good taste in his pictures and gardens at Redleaf—but alas! as strangers, it is denied to us. On the present occasion we shall not stray into the park of the Sidneys—but having followed the lane until we have passed the entrance to Redleaf on the west, and descended the hill until we are in sight of the house at Penshurst, we reach some stone steps which rise abruptly on the west side of the road and cross the stile at the summit of them. Here we are in the midst of quiet pastures, and a walk of a mile and a half over them, crossing in our way the river Eden, which some maps call the Medway, brings us to the village of Chiddingstone, a village consisting of some half-dozen old timber houses of the sixteenth century, in as perfect and picturesque a state as heart of painter or antiquarian could desire. The house of our Master Brooke, a general chapman, is just the genuine model to suggest impressions of what the house of his namesake in the Merry Wives of Windsor must have been. We almost looked to see sweet Anne Page tripping from beneath the shade of the gabled porch. Master Brooke is proud of his residence, as well he may be, and civil too, for he invited us to see the panelled parlour, remaining almost untouched since its first erection. Adjoining Brooke's house is an inn of a similar architecture, in the tidiest order and attractive peacefulness. One or even two beds may be had: and what a world of good it would do to many, just to travel here for a night's lodging, and up to business again by the railway the next morning. It might be managed, ride and all, for ten shillings. The church, which is opposite the old houses, is of a later "decorated" style, but is kept too orderly and respectable to have much picturesque attraction.

This pretty village is situate just on the junction of the clay, called the Oaktree clay—a slaty and strongly bituminous compound, similar to that at Kimmeridge—and the sand. We keep along the base of the sand hills in order to reach Hever. It is about two miles distant, and during the whole walk the spire of Hever Church and the square turrets of Hever Castle appear above the foliage which environs them in the valley below. The tradition has come down to us, that on these hills watchmen were stationed, to announce by sound of bugle the approach of the lusty and royal suitor to Anne Boleyn, as, galloping from Eltham and Greenwich, he descended the opposite sand hills. It was with reference, probably, to his excursions hither, which court babblers might disclose to inquisitive partisans of the injured and neglected Catharine, that Majesty desired its rovings might be unseen. The "Statutes of Eltham," as they are called, enacted that the "officers of his privy chamber shall be loving together, keeping secret every thing said or done, leaving hearkening or inquiring where the King is, or goes, be it early or late, without grudging, mumbling or talking of the king's pastime, late or early going to bed, or any other matter." Harry cared little for the bruiting of his ordinary indulgences, with which the public was familiar—but he had reasons, whilst his divorce was in progress, not to create popular enmity against the lady he had already destined as Queen Catharine's successor.

A rude little inn at Hever, which perpetuates in its sign the name and effigy of Henry the Eighth, will supply a sort of dinner, if hunger ensues before reaching Edenbridge: in that case give timely orders before visiting the castle, so that the meal may be ready as you pass the inn on your return, which you must at all events do, in order to reach Edenbridge. The only object of interest in Hever Church, is a fine and perfect brass on an altar tomb erected in the chancel, to the memory of Sir Thomas Boleyn, Anne's father.

The Castle lies contiguous to the river Eden. Hasted records a traditionary saying that—

> Jesus Christ never was but once at Hever,
> And then he fell into the river.

The meaning of which is supposed to allude to the carrying of the host across the river, and its falling from the priest's hands.

The founder of Hever Castle was one William—a Kentish sheriff, in the time of Edward the Third, who took his name, Willielmus de Heure or Evere, from the place. He rebuilt the old mansion, and having obtained the royal licence to embattle the new structure, he converted the same into a castle. This estate came into the possession of the Cobham family, and was distinguished as Hever Cobham. Sir Thomas Cobham sold the estate to Sir Geoffry Bulleyn, a wealthy London mercer, and it continued in possession of the Bulleyns until after Anne's execution, when her grasping consort seized it to grant it as a residence to another of his discarded wives, Anne of Cleves. The castle had been surrounded by a park, but in the reign of Philip and Mary it was disparked.

Independently of its connexion with the romantic fate of Anne Boleyn, this comparatively mean castle is worth half the show houses in England, as bringing vividly before us all the rudeness and discomfort of past days. It has almost entirely escaped the wreck of the modern spoiler, and has thus retained the most essential characteristic of its original state. Its natural position—low and marshy—would alone suggest fears of malaria, and these are strengthened ten-fold by the dank, green-skimmed, fœtid moat, which still surrounds the castle. So that the precautions which our ancestors took, to keep out an occasional foe placed them in the presence of a more deadly and insidious one at all times. The drawbridge has been supplanted by a permanent roadway, and the ivy luxuriates over the broad-shouldered archway; but in other respects the southern or principal front appears much in the same state as it must have been when Harry was accustomed to pass beneath its portcullis. Since its original construction in Edward the Third's time, some few gradual changes in its exterior, tending to transform it from a fortress to a domestic residence, may be traced by an observant visitor. The insertion of windows generally throughout the exterior—especially square-headed ones, identifying extensive changes with the Tudor times, and the panelled buttresses at the south front are all evidences of this tendency. Passing through the gateway we entered a small low quadrangular court, at no time very ornamental, but less so at present by the coatings of whitewash which have hidden the chequered markings of the timber work. The surrounding apartments are lighted by square-headed and mullioned windows. Opposite to the entrance is a passage which takes us into the ancient hall now used as a kitchen, but remarkable for nothing but its rude construction. The old kitchen offices were close to the hall, very dark, dirty and gloomy, little resembling the *cuisine* of a modern nobleman, with its apt and delicate knick-knackeries. We are led up a rude staircase into several small and low rooms, still preserving their oak panelling, and uneven and imperfectly joined oak floors—suggestive of draughts and cold at every crevice, even when littered daily with straw, as the chambers of royalty were accustomed to be. The chamber assigned traditionally to Anne Boleyn, contains an ancient bedstead with yellow silk furniture, and remains almost untouched, and hence apparently unused. But Anne of Cleves' bed-room has been papered with a blue modern paper, and is now inhabited. Mounting up a narrow rude staircase we enter the long gallery extending along the upper part of the north side of the castle, formerly used for general assemblages and meetings of revelry. The sides are lined with oak panels. The garret-like ceiling is very low, almost within arm's reach, and exhibits the bare rafters which support the roof. At the upper end is a raised recess, in which Harry whispered his soft small-talk to his lady love. This gallery, excepting the filling up of one of its windows, remains entirely in its original state. As a climax, you are conducted to another room across the court-yard on the south side, which has been restored in late times; but its restorations make it far less real than the long gallery we have just spoken of. There are ample subjects for the sketcher's portfolio to be met with throughout this castle and its adjacent parts, not forgetting the old stabling we pass on approaching it.

That Hever Castle was the residence of Anne Boleyn, several times during her eventful life, cannot be questioned. Whether it can claim to be her birthplace, as some say, admits of much doubt, for both Rochford Hall, in Essex, and Blickling Hall in Norfolk, assert similar claims. The latter place, indeed, on the authority of Spelman, a Norfolk man, was "once the seat of the Boleyns, from whence sprung Thomas Boleyn, Earl of Wiltshire, and Ann Boleyn, the mother of the divine Queen Elizabeth. To Blickling was decreed the honour of Anne Boleyn's birth." After the death of her mother, which took place in 1512, Anne resided at Hever with a French governess named Simonette, who taught her music and needle-work. "Besides all the usual branches of virtuous instruction, they gave her teachers in playing on musical instruments, singing, and dancing, insomuch that when she composed her hands to play and her voice to sing, it was joined with that sweetness of countenance, that three harmonies concurred; likewise when she danced, her rare proportions varied themselves into all the graces that belong either to rest or motion." When Anne returned to England from France, whither she had gone in the suite of Mary, the King's youngest sister, who had been forced to marry Louis XII., she took up her residence at Hever, and it is related that her first meeting with the King after her return, was in the garden surrounding the castle. To what good account she turned this early education, in after times, a contemporary biographer shall tell: "She possessed a great talent for poetry, and when she sung, like a second Orpheus, she would have made bears and wolves attentive. She likewise danced the English dances, leaping and jumping with infinite grace and agility. Moreover, she invented many new figures

Digitized by Google

and steps, which are yet known by her name or by those of the gallant partners with whom she danced. She was well skilled in all games fashionable at courts. Besides singing like a syren, accompanying herself on the lute, she harped better than King David, and handled cleverly both flute and rebec (a small violin). She dressed with marvellous taste, and devised new modes, which were followed by the fairest ladies of the French court, but none wore them with her gracefulness, in which she rivalled Venus." (Count Chateaubriand's MS.) Henry told Wolsey "he had been discoursing with a young lady who had the wit of an angel, and was worthy of a crown." Wolsey answered, "it is sufficient if your majesty finds her worthy of your love." Henry replied, "that he feared she would never condescend in that way." "Great princes," rejoined Wolsey, "if they choose to play the lover, have that in their power which would mollify a heart of steel." Two sketches of her portrait, drawn by opposite partisans of her cause, will not be inappropriate to a visit to this spot, Anne's chief residence. Saunders, who was not likely to be over-flattering, describes her as "tall, slender, with an oval face, black hair, and a complexion inclining to sallow; one of her upper teeth projected a little. She appeared, at times, to suffer from asthma. On her left hand a sixth finger might be perceived. On her throat there was a protuberance, which Chateaubriand describes as a disagreeable large mole, resembling a strawberry; this she carefully covered with an ornamental collar-band, a fashion which was blindly imitated by the rest of the maids of honour, though they had never before thought of wearing anything of the kind. Her face and figure were, in other respects, symmetrical: beauty and sprightliness sat on her lips; in readiness of repartee, skill in the dance, and in playing on the lute, she was unsurpassed." The next sketch is from the life of Anne, supposed to have been written by George Wyatt, the sixth son of Sir Thomas Wyatt, executed for rebellion in Mary's reign, who died at Bexley in Kent in the year 1624. "In this noble imp, the graces of Nature, adorned by gracious education, seemed, even at the first, to have promised bliss unto her in after times. She was taken at that time to have a beauty, not so *whitely* as clear and fresh above all we may esteem, which appeared much more excellent by her favour passing sweet and cheerful, and was enhanced by her noble presence of shape and fashion, representing both mildness and majesty, more than can be expressed. There was found, indeed, upon the side of her nail, upon one of her fingers, some little show of a nail, which yet was so small, by the report of those that have seen her, as the workmaster seemed to leave it an occasion of greater grace to her hand, which, with the tip of one of her other fingers, might be, and was usually by her, hidden without the least blemish to it. Likewise, there were said to be upon some parts of her body certain small moles, incident to the clearest complexions."

After the breaking of Anne's engagement with Percy, she dwelt at Hever, and was visited by the King there, and also, it is said, by her old playmate, Sir Thomas Wyatt, who, as possessor of Arlington Castle on the banks of the Medway near Maidstone, was her father's neighbour, distant little more than a morning's ride. But the poetical knight was a married man, and could only address woeful ballads to his mistress:—

> What word is that, that changeth not,
> Though it be turn'd and made in twain?
> It is mine ANNA, God it wot
> The only causor of my pain,
> My love that meedeth with disdain.
> Yet is it loved, what will you more?
> It is my salve, and eke my sore.

Were there space at command, we would also quote his "Description of such a one as he would love." This, and his other songs and sonnets, the reader may find collected in one of the *Aldine* volumes.

George Wyatt gives us a scene of rivalry between his relation, Sir Thomas, and the King, about the Lady Anne:—"About this time, it is said, that the knight, entertaining talk with her as she was earnest at work, in sporting wise caught from her a certain small jewel hanging by a lace out of her pocket, or otherwise loose, which he thrust into his bosom; neither with any earnest request could she obtain it of him again. He kept it, therefore, and wore it after about his neck, under his cassock, promising to himself either to have it with her favour, or as an occasion to have talk with her, wherein he had singular delight, and she after seemed not to make much reckoning of it, either the thing not being much worth or not worth much striving for. The noble prince, having a watchful eye upon the knight, noted him more to hover about the lady and she the more to keep aloof of him; was whetted the more to discover to her his affection, so as rather he liked first to try of what temper the regard of her honour was, which he finding not any way to be tainted with those things his kingly majesty and means could bring to the battery, he, in the end, fell to win her by treaty of marriage, and in this talk took from her a ring, and that wore upon his little finger; and yet all this with such secrecy was carried on, and on her part so wisely, as none, or very few, esteemed this other than an ordinary course of dalliance. Within few days after, it happened, that the King, sporting himself at bowls, had in his company (as it falls out) divers noblemen and other courtiers of account, amongst whom might be the Duke of Suffolk, Sir F. Brian, and Sir T. Wyatt, himself being more than ordinarily pleasantly disposed, and in his game taking an occasion to affirm a cast to be his that plainly appeared to be otherwise; those on the other side said, with his grace's leave, they thought not; and yet still he pointing with his finger whereon he wore her ring, replied often it was his, and specially to the knight he said, Wiat, I tell thee it is mine, smiling upon him withal. Sir Thomas at the length, casting his eye upon the King's finger, perceived that the King meant the lady whose ring that was, which he well knew, and pausing a little, and finding the King bent to pleasure, after the words repeated again to the King, the knight replied, and if it may like your Majesty to give me leave to measure it, I hope it will be mine; and withal, took from his neck the lace whereat hung the tablet, and therewith stooped to measure the cast, which the King espying, knew, and had seen her wear, and therewithal spurned away the bowl, and said, It may be so, but then am I deceived; and so broke up the game. This thing thus carried, was not perceived for all this of many, but of some few it was. For the King, resorting to his chamber, showing some discontentment in his countenance, found means to break this matter to the lady, who, with good and evident proof how the knight came by the jewel, satisfied the King so effectually, that this more confirmed the King's opinion of her truth than himself at the first would have expected."

During the "sweating sickness" Anne was sent for security to Hever, a place likely enough to encourage the epidemic; "As touching your abode at Hever," writes Henry, "you know what aire doth best suit you; but I would it were come to that, thereto if it please God, that neither of us need care for that, for I assure you I think it long." The love letters which Henry addressed to her at Hever are the last positive evidences we find of Anne's connexion with the spot, and with a short extract from one of them we take our leave of Hever: "In order to remind you of my affection and because I cannot be in your presence, I send you the thing which comes nearest that is possible, that is to say my picture, and the whole device, which you already know of, set in bracelets, wishing myself in their place when it pleases you."

Near to the castle on the north-west, is an old farm house, called "Polebrooks," which is worth walking to see for its picturesqueness. If the promised accommodation at the Royal Harry at Hever was not sufficiently tempting, then the tourist may take a pretty green lane walk about two miles further on to Edenbridge, where he will meet with treatment a few degrees more civilized; within a mile of this village the railway has a station.

OUR WEEKLY GOSSIP.

Captain James Ross has returned from his voyage of discovery to the South Seas; but the amount and nature of the information obtained has not transpired. It is currently reported that he is not long to enjoy his ease at home, but is shortly to proceed on another government expedition, to attempt a north-west passage, or at least a North Polar survey.

Captain Harris, who has just returned from a mission to Shoa in South Abyssinia, is about to publish his travels. Captain Harris started from Tajoura, and proceeded in a south-westerly direction to Ancobar, the capital of Shoa: he then made several detours to the S., S.W., and N.W., and collected, it is said, much information respecting a country, previously little known, called Susa, which lies to the south of Kaffa and Enarea; and returned to Tajoura by a different route. He brought with him a jet black mule with magnificent trappings, sent by the King of Shoa as a present to the Prince of Wales, several specimens of Abyssinian arms, &c.. and an illuminated letter to Her Majesty in the Arabic language.

The lessees of the Patent Theatres are bestirring themselves, and preparing for the ensuing campaign; and, if we may infer their probable course of operations from the forces which they are mustering, Covent Garden will be the stronghold of the legitimate drama, and Drury Lane the camp for opera and ballet. Such an arrangement would benefit all parties: the different classes of entertainments might thus be supported by the best available talent, and produced in the most complete and finished manner; for it is only by the nearest possible approach to perfection in the *ensemble* that the public can now be attracted to theatres. How the new Act will affect the Patent and Minor houses yet remains to be seen; and its influence, if any, on the drama, time alone can show: the operation of the new law must be felt before its working can be tested, for it will either be beneficial or injurious, according as it is administered. Its condemnation is, we think, certain, and consequent on the fact that it gives despotic power over the literature and property of the stage to a court functionary, the Lord Chamberlain (a personage not appointed on the score of his superior wisdom),—or rather to his deputy, who is still less amenable to public opinion; while the amateur Justices of quarter sessions, country squires, and parsons, hold the issues of life and death of the provincial stage and its managers. This is said to be an act merely "declaratory" of former acts, simplifying and improving obsolete and cumbrous legislative forms; and inasmuch as it is more intelligible, and no longer classes actors with "rogues and vagabonds," it is an improvement: moreover, it allows the minor theatres to play Shakspeare; a preposterous clause, prohibiting the performance of Shakspeare's plays within five miles of either of the Patent Theatres, having been very properly withdrawn. Still, if it does not actually impose new shackles on the drama, it substitutes for the old clumsy bonds a new set of fetters, whose restrictions will be more galling. It confirms the vicious principle of a Censorship of the drama, which would not be tolerated if applied to any other kind of literature, or to the newspaper press; and this at a time when public opinion has discountenanced performances which the Lord Chamberlain had sanctioned. If public decency or morality be violated, there exists in audiences the power and the will to repress the offence; while the Chamberlain and magistrates can only meddle in a mischievous manner: besides, the licenser's objections have generally been of a kind to provoke ridicule. Practically, his interference has been an affair of fee-gathering. All classes of the theatrical community—patent proprietors and minor managers in town and country—authors and actors—are opposed to the new Act, and we think with just cause. What literature can flourish under a despotism; a despotism not the less pernicious because it does not appear formidable? What property is safe when the warrant of any four country magistrates, or the veto of a court officer, can shut up a theatre, and ruin managers and actors by large fines? Why the mere amount of security required of a manager—namely, two good sureties resident in the neighbourhood for 250*l.* each,—is enough to prevent many a respectable man from opening a provincial theatre. Where is a country manager to find such bail under such liabilities, and with a capricious and irresponsible power impending over his fortunes? We have been astonished at the tacit acquiescence of the newspaper press in such a law; and have ceased to wonder at the indifference of the House of Commons to any no-party measure.

An exhibition has just been opened at the Egyptian Hall, Piccadilly, of a model of the city of Venice, said to be on a scale of one 540th part of its real dimensions, and to represent every object, however minute; amongst them 102 churches, 122 towers, 340 bridges, 135 large palaces, 927 smaller palaces, 471 canals, &c. together with 18,479 private houses!

Digitized by Google

Allowing for some little perplexity consequent on the multitude of objects on so small a scale, the modellers are entitled to great praise, and the work will give a pleasant idea of this city of palaces to those who have never had the good fortune to visit it, and revive for those who have, many pleasant recollections. The larger buildings are very accurately modelled. It is illuminated by a novel artificial light, which has an excellent effect.—A letter from Venice, in the French journals, mentions that "the construction of the bridge, which is to connect the city with the main land, is urged on with great activity. Of thirty-four arches, which it is to have, twenty are already completed, and, to all appearances, this gigantic undertaking will be entirely finished before the end of next year. A new section of the Venice and Milan railway has been commenced—from Milan to Steriglio—so that at present three portions are going on simultaneously. A company, of which the greater number of the members reside at Venice, has obtained permission to prolong to Bergamo the Milan and Monza line."

The exhibition of pictures this year in Dresden is said to surpass most of the previous ones. Five cartoons by Prof. Schnorr and a picture by Bendemann are very highly spoken of.—Respecting Art in Belgium, we have a few words from a Correspondent. "Though on a route more beaten than the old Bath road, on which the swarms of English, by their numbers, their impatience, and their noisy curiosity, remind me of the simile of Burns,

As bees bizz out in angry fyke,

you may still like to have a paragraph on art in Antwerp, especially about the new statue of Rubens. The ample richness of this seems suitable to the place and the man: rarely have the sumptuous undulations of velvet and satin been better turned into bronze; the expression, too, of the features is noble, the pose of the figure easy. In short, comparing this effigy with the new Albrecht Durer at Nuremburg, or the new Mozart which I saw in the Stiglmayr foundry at Munich,—I think the grace of propriety pre-eminently attained in this portrait statue. To be sure, the gorgeous splendour of Sir Peter Paul is an easier thing to present in these our days, than the more highly elevated spirituality of the old German, while his robust manly beauty offers a more tempting subject than the feeble if not inexpressive traits of the musician of Salzburg. But I was still more favourably struck by the present condition of Flemish Art, while going through the collection of modern pictures, now open in Antwerp. I am familiar with our own provincial exhibitions, and have seen one or two in the German capitals and smaller towns; but I think in some respects this show may challenge the best of its competitors. The young Flemings have come nearer their glorious predecessors, than either the young Germans, or the young French, or the young English. There is much trash: but among it one or two gems. It would be hard to name the contemporary, for instance, who could have painted a more interesting picture on Peter the Great at Saardam, than Prof. Wappers, the director of the Antwerp Academy. De Keyser seems to be forsaking his first forcible choice of subjects, for more graceful and thoughtful combinations. He has a Tasso reading his verses to Eleonora, a Raphael and Fornarina: the last really an exquisite *tableau de genre:* and all the three works I have mentioned are executed with brilliancy and solidity of colour—equally clear of lacquered tameness or audacious flourish—most worthy of honour, and carrying down to our days, something of the old gorgeousness of the land, and its school. This is as it should be; worthy and characteristic. Some of the smaller pieces reminded me honourably of Mieris, and Terburg, and Maas: none, however, shared the coarseness, which, by fits, visited all these clever artists. The landscapes were bad: and I was proud to see, that in a cattle piece Paul Potter's successors are distanced by our own Sidney Cooper. One or two French artists, also, have contributed to this show: I may name MM. Collignon and Lepoittevin, though the nationality of their tones of colour made their pictures look by comparison far more leaden at Antwerp than at home."

A bronze statue, cast after a model by Schwanthaler, of the Margrave Frederick of Bayreuth, has lately been executed, at the command of the King of Bavaria, and sent to the university of Erlangen, of which the Margrave was the founder. Two models of statues by Teneroni, one of the present king of the Two Sicilies, and the other of Bolivar, have been sent from Rome to Munich to be cast in bronze by Stiglmayr.—The statue of Bichat, the celebrated physician, and author of *Recherches sur la Vie et la Mort*, was inaugurated on the 25th ult. at Bourg, with great pomp. Bichat is represented contemplating the movement of life in an infant, whilst at his feet lies a half-dissected body.—The statue of the Abbé de l'Epée, the founder of the institution for the Deaf and Dumb, was last week inaugurated at Versailles with great ceremony.

The Annals of last year's proceedings of the Archæological Institution of Rome have been recently published, and contains drawings and description of the Temple of Mount Ocha, near Carystus, in Eubœa, communicated by Professor Ulrichs, of Athens. This temple is generally believed to be the oldest and best preserved specimen of the kind in Greece, and is particularly remarkable for the massiveness of its walls, and the peculiar structure of its roof. The prize proposed by this Academy in 1842, for the best essay on the Coinage of Italy, has been gained by Dr. Achille Gennarelli, author of the text of the 'Museo Gregoriano.' He opposes many of the opinions advanced in the work published by Marche and Tessieri, under the title of 'Aes grave del Museo Kircheriano,' which, although up to this time the standard work on Italian coinage, was yet so faulty as to induce the Archæological Society to propose a prize for another on the same subject.

The daily papers announce the death of the Rev. James Tate, Canon Residentiary of St. Paul's, but far better known as late master of Richmond school, Yorkshire. He was a sound scholar, an excellent preceptor, and an amiable man. He published some useful works, amongst which the best known are his *Greek Metres*, *Horatius Restitutus*, and the *History of St. Paul.*

This, though the dull season in the publishing world, is often one of promise,—but as yet these blossoms come forth but sparingly. The Messrs. Longman, however, announce as in preparation—'Lord Jeffrey's Contributions to the Edinburgh Review'—'Laing's Chronicles of the Kings of Norway'—'The Life and Times of Richard III. as Duke of Gloucester, and King of England,' by Caroline A. Halstead—a new volume of 'Howitt's Visits to Remarkable Places':—and amongst illustrated works, Richardson's 'Effigies in the Temple Church.' The promised 'Fac-similes of the Prize Cartoons' we mentioned heretofore; but may add, that the ten additional prize cartoons are about to be published by Mr. Maclean. While on this subject, we may mention that the prize cartoons will be exhibited, in the course of a few days, in the Suffolk Street Gallery. The unsuccessful competitors have also, it is reported, resolved to exhibit their works, but are divided between the merits of the Pantechnicon and the Pantheon as the more appropriate locality.—The Rev. J. Allen's 'Diary of a March through Scinde and Affghanistan,' may shortly be expected from Messrs. Hatchard; and from Mr. Murray, Barrow's 'Life of Admiral Sir F. Drake'—Sir G. Wilkinson's 'Modern Egypt and Thebes'—Stisted's 'Letters from the Bye Ways of Italy'—Murchison's 'Russia in Europe and the Ural Mountains Geologically Illustrated'—Gruner's 'Fresco Decorations and Stuccoes of Churches and Palaces in Italy,' and Phillips's 'Figures of British Belemnites.' Mr. Van Voorst promises an illustrated edition of Bloomfield's 'Farmer's Boy,'—Professor Ansted's 'Geology, as a Branch of Natural History, and in its Application to the Arts,'—Mr. Garner's 'Natural History of the County of Stafford'—and Miss Mary Roberts announces a work on Ruins and Old Trees associated with memorable events in English History.

DIORAMA, REGENT'S PARK.

NOW OPEN, with a NEW EXHIBITION, representing the CATHEDRAL of NOTRE DAME at Paris, with effects of Sunset and Moonlight, painted by M. REVOUX, and the BASILICA of ST. PAUL, near Rome, before and after its destruction by Fire, painted by M. BOUTON. Open from Ten till Six.—N.B. A GRAND MACHINE ORGAN has been constructed expressly for this Exhibition, by Messrs. Gray and Davison, of the New-road, and will perform the Gloria, from Haydn's Service, No. 1, during the midnight effect of the Cathedral of Notre Dame.

MUSIC AND THE DRAMA

NEW PUBLICATIONS.

The People's Music-book; consisting of Psalm Tunes, Sacred Music, Songs, Duetts, Trios, Glees, &c., principally arranged for Four Voices, with Accompaniments for the Organ or Pianoforte, by James Turle, Esq., Organist of Westminster Abbey, and Edward Taylor, Esq., Gresham Professor of Music. Part I.—Especial care should be taken that cheap food should also be wholesome; whereas the people of England are here invited to a banquet, the staple viands of which are sometimes of doubtful quality, and generally badly cooked. We cannot understand why Handel's noble Hundred and Fourth Psalm should be transposed a tone; wherefore such tabernacular melodies as 'Shirland' and 'Silver Street' should be again issued; or how the carelessness in adapting the text to the psalmody, which allows such accentuation as "Je|sŭs," "Mer|cȳ," is to be excused. The secular moiety of the work contains our old favourites, 'Ye spotted snakes,' 'Come unto these yellow sands,' &c. Dowland's madrigal, 'Awake, sweet love,' is more welcome to us, because less hackneyed. As regards accompaniment, a want of system is observable: the glees have none—the madrigal none: while in Professor Taylor's *trio* for three female voices, the vocal parts are all but literally doubled on the pianoforte. Nothing in the way of taste can be worse than this.

The next publication is more interesting, being none other than a re-issue of *The Music in Shakspeare's Macbeth, with an Accompaniment for the Pianoforte*, by Mr. E. J. Loder, *and a Historical Preface*, by Mr. Rimbault.—This preface gives a superior value to the present edition over its predecessors, since Mr. Rimbault adduces in it reasons why, in despite of Playford's explicit allusion, in his 'Roscius Anglicanus,' to Locke, as the author of the music in Macbeth, John Eccles may possibly have been the original composer. A MS., it appears, exists, bearing the name of the latter, the authenticity of which is not disputable; and in this the familiar airs, choruses, &c., are found in a more imperfect shape than they wear at present. "We have no hesitation," continues Mr. Rimbault, "in pronouncing it to be the original sketch; and that what has been, and still is, received as Matthew Locke's, is a more finished and skilful adaptation of the same work." He throws out a further hint, based on a score extant in Purcell's handwriting, that England's greatest genius may also have had a hand in enriching and polishing the music, which becomes plausible, when we recollect the unscrupulous nature of all theatrical proceedings, from the days of the Cibber-*isms* committed against Shakspeare, to the recent attacks of the patchers and innovators upon Handel's perfect and symmetrical 'Acis.' The question will furnish pretty matter of controversy to the antiquarians. We are glad of the facts, and glad of the music in so complete a form. It is one of our most interesting monuments. To profess, however, the ecstatic admiration of it, which Englishmen are expected to feel, would be hypocritical. We have never heard it produced even on the stage without a renewed impression, that the melody was equalled by the monotony. One key (with the solitary exception of the very short chorus, 'Put in all these,') pervades the composition throughout. The tune, however, 'Let's have a dance,' is unique, and stands out in such bold relief from the rest, that we may be forgiven, perhaps, for also propounding *our* antiquarian query, and suggesting whether, seeing that changing and amending were then, as now, the order of the day, this may not have been a genuine English melody of a date anterior to that of Eccles, Locke, or Purcell? Sixty years hence the Rimbault of our children may have lost sight of the original Sicilian tune in Bishop's 'Home, sweet home'; or of the snatch of the Roman litany, on which Rossini's 'Di tanti' is founded; and this in spite of the *Athenæum.* Perhaps the place which this work deserves to hold in European composition, will be best apportioned by comparison. We would recommend all curious in the matter to turn from Locke to Lulli,—say, the 'Atys' of the latter; and we think that for variety, science, and originality, the witty *aide-de-cuisine* of Mdlle. de Montpensier must be allowed to carry off the palm. An English writer had need, however, wear an invisible gar-

Digitized by Google

ment of mail, after having put such a heresy in print.

Let us try if we can make our peace over a heap of modern English songs. The first are two from Mr. Hatton's operetta, 'The Queen of the Thames,'—*The Skylark*, a *polacca*, for Miss Romer, and *Away to the Silvery Stream*, a ballad, for Mr. Phillips. To appreciate the true value of the first, perhaps, it ought to be compared with the *polaccas* formerly sung on the English stage by Braham and Mrs. Dickons, and held in high esteem; or with the more sterling, but still rather vulgar compositions, 'Go, trifler, go,' and 'Tyrant! I come,' composed by Bishop, for the favourite Stephens or Tree of the hour. Whether as regards melody, musical structure, or display of the singer, if thus measured, 'The Skylark' deserves a place among English *bravuras*: but that the day of these and of English opera, as then understood, is gone by, Mr. Hatton knows as well as his critics. It is neither by emulating the puerilities of an obsolete school of writers, nor by pedantically aping the crudities of German science, (its one objectionable portion,) that our national composers can raise themselves to the place they so warmly desire to fill. Though the line to be taken is not easy to define, it might, we think, be found.

Mr. Benedict often gives us fair specimens of the skill with which a foreigner may adapt himself to the genius of our language, and the taste of our public, without loss of caste: his '*Alone*,' however, is not one of his happiest efforts.—Mr. E. J. Loder, too, has shown more than once how a few of the secrets derived from foreign training may enrich the meagre style of the old Vauxhall ballad; but the strain upon his invention is too perpetual: though his cleverness peeps out even in such a trifle as the *rondo, Over hill, over dale*, from the Tempest. His *Song of the Water King* is after a worse pattern—that of the *bow-wow* English bass song; and is far surpassed by many a dozen of its forgotten predecessors,—we need but instance one, Bishop's 'O firm as oak,' from 'The Englishmen in India.' But a yet stranger task has been exacted from Mr. Loder, in which he is associated with Mr. Barnett and Mr. Knight. What is to be said to these *Songs from the Text of Shakspeare*, containing 'She never told her love,' diluted into Haynes-Bayly-namby-pamby; and another serenade to Imogen, done by Mrs. Crawford? We must positively give a verse from the latter, else the fact of such a piece of audacity having been committed would hardly be credited. Thus, then, is 'Hark! the lark' amplified—

> Sweet Imogen, awaken!
> The air blows fresh and free;
> The spousal morn hath taken
> Her bridal blush from thee:
> The chalic'd lilies borrow
> The whiteness of thy brow,
> And as in gentlest sorrow,
> Their flexile heads they bow.

Whether such productions are most discreditable to rhymester, musician, or publisher, we leave others to decide;—hoping that no singer will be found to make a fourth in the speculation. We must close the notice of new English Songs, by announcing the publication of *The Happy Day*, a ballad, by Mr. Knight; and by saying that *Oonagh's Grave* and *The Maniac* will hardly sustain the popularity won for their composer, Mr. Crouch, by his sweet melody, 'Kathleen Mavourneen.'

Two grand *scenas* from Pacini's 'Sappho'—*No more from thee divided*, and *Morning has never dawned*,—would serve as text for a homily on versions of foreign words to music, were this the place. Enough to express our conviction, as a general principle, that no words translated from verse will sing comfortably or sound naturally, except they be translated *into* verse,—a canon applicable to the irregular lines of a recitative as well as to the coquettish rhythms of a *cabaletta*. There are few specimens so licentiously irregular, or so *instrumentally* formal and piquant, as to defy those who bring to their task mastery over language, music, and versification—*vide* Moore's 'National Melodies,' where the quadrille, the *ländler*, the *seguidilla*, the *modinha*, the *barcarole*, nay, even the *scherzo* of Beethoven, have been mated to words as easy to say and sing harmoniously as most combinations of Italian liquids. Those who attempt the task, would do well to study the command of language and metre (in particular the employment of the final double syllable, and of *tempo rubato*,) exhibited in 'Hudibras.' Seven years ago, in this Journal (No. 456), an able writer extolled Butler as one of our most consummate versifiers. The article is well worth the careful consideration of translators, even such as aspire no higher than the "*felicita*" or "*speranza*" of Romani's and Rossi's *libretti*, but who still mean to execute their duty well.

From these hints, to which we will not on the present occasion give special application, we glide naturally to two *Duetti di Camera*—*La Gita in Gondola*, and *La Zingarella*, by Giovanni Maraviglia. Though these are not equal to Gabussi's chamber duets, being less workmanlike, they are still elegant, and will prove as agreeable to sing as to hear. In *O care Tenebre*, an *ariette* for a contralto, Signor Maraviglia has somewhat too shamelessly appropriated a well-known phrase from Mozart. But we fear the "*Maestro*" is generically unscrupulous:—Rossini and Bellini "conveyed" phrases of sixteen bars' length whenever it so pleased their indolence.

Not so our trusty and well-beloved cousins the Germans! whose resolution to be original not unfrequently leads to a stiffness and eccentricity anything but engaging in song-writers. With the exception of Weber and Schubert, we cannot call to mind one who has distinguished himself in this capacity, without a certain infusion of southern *disinvoltura* to soften the stubbornness of his nationality. Evidence to this point will, we think, be found in Book 12 of the *Gems of German Song*, here before us, which contains eight tuneful and expressive songs by Mendelssohn, Kücken (a name new to us), Lauer, Eckert, and Staudigl. This publication is valuable and cheap: we think, however, that the German words might have been judiciously printed as well as the English text.

We can but add a line, to recommend to the violin student Mr. Loder's *Whole Art of Bowing*. As the work of our best violin master and our best leader, it can hardly be other than useful: the exercises seem to us well varied.

MISCELLANEA

Paris Academy of Sciences.—Aug. 30.—The greater part of this sitting was occupied with a report on a communication from M. D'Orbigny, 'On the Geology of South America.' The author has ascertained, that the geology of that part of the globe bears a strong resemblance to that of Europe, and that where a difference exists it is by no means so striking as, from the great distance, might have been imagined.—M. Arago read a letter from the Minister of Public Instruction, requesting him to consult the Academy as to the propriety of publishing, at the expense of the State, the works of the celebrated Lavoisier. M. Arago stated, that he had in his hands several manuscripts which had been confided to him by the widow of Lavoisier, and which he would place at the disposal of the Academy. A commission was charged with the subject referred to in the above letter.—A paper was received from M. Stanislas Julien, containing the description and the seed of a textile plant, received from the Abbé Voisin, one of the Directors of the Foreign Mission in China.

Manchester, 4th of September.

British Association.—You will oblige me by correcting an error which appears in your Report of the conversation which took place in Section C at Cork, on Mr. Murchison's Permian System: I am made to say that I had found fishes of the genera Cœlacanthus, Platysomus, and Palæoniscus in the Bunter-sandstein at Weston, Cheshire, accompanying footmarks of the Labyrinthodon; whereas, what I said (after noticing the occurrence of such impressions) was, that three genera of fish in the coal measures, namely, those above alluded to, occurred also in the marl slate of the new red sandstone formation, without naming any specific locality. Apologizing for occupying your valuable columns,

I am, &c. E. W. BINNEY.

Gold Dust.—The Russian journals give the following particulars relative to the progress of discovery of gold-dust, &c., in that empire. During the summer of 1842, the arrondissement of the mines of Wiask was explored by five several expeditions commissioned to seek for deposits of gold-bearing sand, and one sent in search of precious stones. The former discovered 22 different beds of sand yielding gold, situate partly in new localities and partly in the neighbourhood of the beds already in course of being worked. The whole of the sites discovered in that year contain a mass of 18,375,269 pds. of sand, yielding 34 pds. 39 lb. $8\frac{48}{96}$ zol. of gold. In the mines of Zlatoust was found a remarkable crystal of colourless topaz, vulgarly called Siberian diamond, weighing $61\frac{1}{2}$ zolotricks; and in the mines of Wiask, a lump of gold of the weight of 25 zol.

Progress of Lotteries.—Upwards of 4000*l.* will be awarded to Subscribers. — Important and attractive Musical, Literary, Fine-Art, and General Distribution. — Subscribers must obtain, on — October next, by their One-guinea Subscription (in fact, by a chance which costs them nothing), the Grand Finger Organ, which cost 550*l.*, and three other Organs; also a new and splendid 6½-octave Cabinet Pianoforte, value 60*l.*, for one guinea, and six other Pianos; capital Billiard Table, cost 80*l.*, for one guinea;—Daniell's Oriental Scenery, published at 200 guineas, for one guinea; and eighty other costly and superb Works, and 389 other Prizes, from 2 to 200 guineas each, consisting of fine Gallery and Cabinet Pictures; numerous articles of elegant and costly Furniture; two Hogsheads and six Quarter-casks of Port and Sherry; six cases of the finest Champagne; 20 dozen of Sherry; 68 dozen of other Wines, &c. &c.; besides 800 intermediate Prizes. The Drawing will be conducted on the plan of drawing for Prize Pictures at the London Art-Union, but the arrangement far more liberal.—*Cambridge Advertiser.*

A Sheet of Paper.—Mr. Limbird, of the Strand, has a sheet of paper four feet seven inches wide, six hundred yards long, and weighs one hundred and thirty-seven pounds. It is of fine texture, and has been made for the purpose of taking impressions of monumental brasses.

Musical Instruments.—A Lyons journal states that M. Marlaveau, a silk-manufacturer of that city, has applied the principles of the Jacquard loom to musical instruments. His first trial has been on the accordion. A card is used to vary the tunes as it is used in the weaving to change the pattern.

Ortolans.—Perhaps the greatest refinement in fattening is exhibited in the manner of feeding ortolans. The ortolan is a small bird esteemed a great delicacy by Italians. It is the fat of this bird which is so delicious; but it has a peculiar habit of feeding, which is opposed to its rapid fattening—this is, that it feeds only at the rising of the sun. Yet this peculiarity has not proved an insurmountable obstacle to the Italian gourmands. The ortolans are placed in a warm chamber, perfectly dark, with only one aperture in the wall. Their food is scattered over the floor of the chamber. At a certain hour in the morning the keeper of the birds places a lantern in the orifice of the wall; the dim light thrown by the lantern on the floor of the apartment induces the ortolans to believe that the sun is about to rise, and they greedily consume the food upon the floor. More food is now scattered over it, and the lantern is withdrawn. The ortolans, rather surprised at the shortness of the day, think it their duty to fall asleep, as night has spread his sable mantle round them. During sleep, little of the food being expended in the production of force, most of it goes to the formation of muscle and fat. After they have been allowed to repose for one or two hours, in order to complete the digestion of the food taken, their keeper again exhibits the lantern through the aperture. The rising sun a second time illuminates the apartment, and the birds, awaking from their slumber, apply themselves voraciously to the food on the floor; after having discussed which, they are again enveloped in darkness. Thus the sun is made to shed its rising rays into the chamber four or five times every day, and as many nights follow its transitory beams. The ortolans thus treated become like little balls of fat in a few days.—*Playfair*, in the *Journ. Agricult. Soc.*

Fall of Frogs.—An extraordinary phenomenon accompanied the heavy fall of rain on the 28th ult., namely, an innumerable quantity of frogs of small size. Thousands of them must have fallen during the evening and early part of Monday night. They were to be seen in immense numbers in the town of Stourbridge and its neighbourhood, far removed from any place in which they could have been bred. On the same evening a man and a boy were passing in the storm from Brettel-lane to Stourbridge, when the latter called the attention of the former to the fact of one falling on his shoulders, which caused them to be more observant; and they afterwards noticed several which fell upon them. Similar phenomena have been observed before in different places. The circumstance may be accounted for on the supposition that a pool or other water containing the diminutive frogs has been within the influence of the storm, when the water and its contents have been carried up, in a similar manner to that in which we sometimes see dust or hay carried up in a spiral form by what is termed a whirlwind.—*Worcestershire Chronicle.*

THIRTEENTH MEETING OF THE BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

[*From our own Correspondents.*]

MONDAY, AUGUST 21.

SECTION A.—MATHEMATICAL AND PHYSICAL SCIENCE.

Col. SABINE read Sir J. F. W. Herschel's 'Report of the Committee appointed for the Reduction of Meteorological Observations.'—The Report stated that the Committee had made great exertions to complete the series of equinoxial and solstitial observations during the years 1835, 1836, 1837, and 1838, and had succeeded in obtaining 334 sets of observations made at 69 distinct stations, a synoptic statement of which, with the geographical elements of the stations, was annexed to the Report. These observations, however, by no means formed a connected whole, and promised no distinct or definite results, except as regarded barometric fluctuations, or the propagation of atmospheric waves, which by this method of inquiry alone can be traced over an extensive region. When the trifling depth of the ponderable atmosphere enveloping our globe is taken into consideration, with the number and magnitude of local circumstances which influence its movements, it will be manifest that we may disregard altogether the figure of our planet, and assume, for the purposes of our inquiry, that the atmosphere extends indefinitely in a plain, in portions of which the phenomena vary with local causes. The stations of observation have been divided into groups, grounded on this view of the subject; and two objects have been chiefly kept in view:—1st, The tracing, where it can be accomplished, the curves of one particular wave over the whole area embraced within one of our districts; and 2ndly, Where this cannot be done, the observation of connexions between particular localities, with a view to the subdivision of the total area into barometric districts, in which the atmospheric fluctuations shall be, generally speaking, similar in their phases. In discussing the observations in the European group, the following have been the principal results:—1st. Distinct barometric waves, of many hundreds of miles in breadth, have been traced over the whole extent of Europe,—that is to say, at least over an area having Markree, in Ireland, Cadiz, in Spain, Parma, in Italy, and Kremsmünster, in Hungary, for its angular points, not only the breadth but the direction of the front, and the velocity of progress of such waves, have been clearly made out. 2nd. Besides these distinctly terminated waves, we have been able, if not to trace the rate and line of progress, at least to render very evident the existence of undulatory movements of much greater amplitude; so great, indeed, as far to exceed in dimension the area in question, and to require much more time than the duration of the term series (thirty-six hours) for their passage over a given locality. 3rd. In Europe, Brussels is clearly entitled to be regarded as a point of comparatively gentle barometrical disturbance. Very deep waves, it is true, and very extensive ones, ride over it; but with regard to smaller ones, it may be regarded as in a certain sense a nodal point, where inequalities are smoothed down, and oscillatory movement in general is more or less checked; and such movements increase in amount as we recede from Brussels and Cadiz, especially towards the north-west, as far as Markree. 4th. The diurnal oscillations are very conspicuous in a single day's observations, hourly continued; this being rather the general rule than the exception. In particular, the afternoon minimum (4 P.M.) stands forth as a prominent feature in almost all cases where there is not some violent barometric disturbance. 5th. Hanover offers barometric anomalies, separating it from the Belgian type (to which latter the south of England as well as Geneva belongs). Possibly it is connected with a Scandinavian or Polish system. Edinburgh is as remarkable for inequalities and abrupt fluctuations in its barometric changes as Brussels is for the reverse. Turin seems to be much affected by its proximity to the Alps, which gives its barometric curves frequently a very disjointed character. Between the Italian stations (Turin and Parma) and the Spanish (Cadiz, Gibraltar, Tangier,) no community of character and no mutual dependence prevails. Cadiz, Gibraltar, and Tangier are subject to an anomalous rise and fall of the mercury between midnight and sunrise, which interferes with and often counteracts and overcomes the regular tendency to depression in that interval, a peculiarity which is probably owing to the proximity of the great surface of the African deserts. At Tangier the barometric fluctuations seem to be remarkably small. Markree is remarkable for the boldness and freedom of contour in its barometric curves, and the great range of their fluctuations, compared with stations to the south-east of it. The barometric curves derived from the Indian stations are remarkable for their general smoothness. In those from Mauritius the diurnal oscillations are conspicuously developed. In South Africa, the observations made at two stations exhibit much local disturbance; those made at Bathurst showing frequently an opposite tendency to those made at Cape Town. The American observations are as yet too incomplete to allow their apparent irregularities to be traced to laws. The Report then proceeds to consider the utility of prosecuting these observations, and advises that the field of inquiry be somewhat narrowed by limiting it to some distinct point of meteorology, such as the tracing of atmospheric waves, and the determination of the co-efficients of the diurnal periods. To the latter point the hourly system of observation alone is applicable; and monthly series (on the 21st of each month) of such observations from a vast number of stations, in which absolutely nothing else were set down than the hourly march of the barometer for twenty-five consecutive hours, so as to begin and conclude the twenty-four hours with an observation, would, in itself, if continued for a few years, leave nothing to be desired on this important head. All observations should be at once reduced, and there should be no omissions, as observations, defective in any way, cease to be comparable, and lose much of their value. The fluctuations already traced, by projecting the term observations, are those only whose total duration of rise and fall is comprised within, or does not much exceed the twenty-four or thirty-six hours over which the term extends; but these are by no means those which, either theoretically, or, indeed, practically speaking, are to be regarded as most important. Mr. Burt laid down, from his own observation, barometric projections, in which the interval between two successive maxima of pressure occupied in the one case seventeen days without any intervening maximum, in another a similar period, with two subordinate maxima interposed, and another where a beautifully symmetrical wave of an extremely remarkable character occupied thirteen days for its complete rise and fall. When dealing with undulations of such extent, it is by no means a visionary speculation to consider the possibility of tracing them over the whole of our globe—nay, perhaps of obtaining evidence of their performing, tide-like, two or more revolutions round its surface; and in this most interesting inquiry Mr. Burt has stated his readiness to engage, should it be the pleasure of the British Association to intrust the subject to his inquiries by appointing him a Committee for that purpose. The Report then passed to the consideration of the winds, which it divided into two classes,—winds of translation, and winds of oscillation, nearly in the way in which the movements of the ocean may be divided into oceanic currents and tide streams, and these again (regarded as the results of oscillatory movements) may be referred to the general laws which regulate the molecular movements of water in contact with the bottom of the sea, when under the influence of the undulatory agitation. The trade winds and greater aerial currents of a similar character, to which the name of monsoons is given, are winds of translation. They have a distinct barometrical origin in the diminution of pressure in approaching the equator, caused by the expansion of the equatorial atmosphere, and the overflowing of the upper strata outwards towards the poles. But this cause is not oscillatory, but permanent. Monsoons also arise in the same way, from local heating and cooling,—periodically renewed, it is true, but in long periods of six months in duration, so as to give rise to steady currents; with such winds the present research has little connexion, except in so far as their powerful influence mixes with and masks the effect of the other class of winds—those which arise from barometic oscillation, and which are connected with such oscillation in a more direct and intimate manner. The oscillations themselves, perhaps, take their rise in local and temporary causes, prevailing over great areas simultaneously,—the principle, no doubt, depending on the prevalence of cloud or clear sky, rain, or dryness, over great tracts for several days or weeks in succession. But once produced, and an extensive atmospheric undulation once propagated, a wind or system of winds dependent on such undulation necessarily arises also. Every wavelike movement in a fluid consists of two distinct things, an advancing form and a molecular movement. Now the advancing form is indicated to us by the barometer—the molecular movement by the wind, and between these two phenomena there subsists of necessity a close and purely dynamical connexion: and it would be no small meteorological discovery, if, by the study of the characters and progress of barometrical fluctuations, we could either make out any law of the greater ones which would enable us even roughly to predict them, or any peculiarity in their physiognomy, by which we could recognize them in their earlier stages, as by this we might possibly be led to the prediction of great storms. It is a fact which has of late been a good deal insisted upon, viz. that at certain stations the winds revolve in one uniform direction: the vane, for example, at Greenwich, (as is stated by the Astronomer Royal,) makes five revolutions per annum in one uniform direction—may not this phenomenon be, in effect, an indication of some atmospheric node, where a line perpendicular to the strata of the atmosphere may be regarded as describing a conical surface round the true vertical. If it be true (as the discussion of the Term Observation may lead us to suspect,) that Brussels is in effect such a nodal point, the examination in this view of its "Wind-Rose" would be interesting. On the subject of revolving storms, Sir J. Herschel states that he is not fully prepared to speak; but he adds, that there is certainly one point of view in which some of the principal of their phenomena would seem capable of explanation in this way of conceiving winds of oscillation, and in which they would become traced up, not into funnel-shaped revolving depressions, in the nature of water-spouts, but simply to the crossing of two large long waves, running in different directions, thus:

Where A A′ A″ represent the progress of one wave, B B′ B″ that of the other, and *t t′ t″* that of the tornado made by their intersection. The way in which a rotary movement in an elliptic or circle, or in some other partly oval and partly rectilinear figure, may result from the combination of two rectilinear movements of advance and recess, will easily be understood by the analogy of the circular and elliptic polarization of light, where rectilinear movements of the ethereal molecules are conceived to be similarly combined. This is the nature of a *vera causa*, which, resulting from dynamical considerations, perfectly general and indefeasible, cannot be without some influence, the only question being that of amount.

The DEAN OF ELY and Dr. ROBINSON testified the great importance of the reductions already effected by Sir J. Herschel, and offered several suggestions as to the best mode of complying with the wishes of Sir John Herschel for continuing the reductions, and having the grant renewed.

Col. SABINE'S 'Report of the Committee for the Translation and Publication of Foreign Scientific Memoirs,' merely enumerated four treatises by Gauss and Lamont, which have been translated and published since the last meeting.

Prof. MACCULLAGH, the President (the Dean of Ely, Vice-President, in the meantime taking the chair,) read a communication 'On the Theory and Laws of Total Reflexion.'—The phenomena of total reflexion had for centuries excited the attention of mathematicians, who had endeavoured in vain to explain it; and it had been regarded by Newton as an insuperable objection to the Undulatory Theory of Light; for, according to him, the vibrations of the

Digitized by Google

ether could not be suddenly stopped at the separating surface of the denser and rarer media; as an elastic fluid communicates motion on all sides, the vibrations on arriving at the surface of the rarer medium, should necessarily pass into it, and thus there would always be some refracted light; and total reflexion, on the hypothesis of undulations, would be impossible. It is curious, therefore, to observe that the phenomenon is now explained, and that for the first time, on this very hypothesis, and all its laws deduced with geometrical accuracy. The principles, however, on which the explanation is founded, are altogether new, though in strict accordance with the theory of waves, and the general laws of dynamics. Before the condition of the totally reflected light can be determined, the motion which takes place in the rarer medium—a motion not observable by the senses—must be ascertained; Poisson had caught a glimpse of the way in which the solution was likely to be effected. In some investigations respecting the transmission of motion from one elastic medium into another, across their separating surface, he had found that in certain cases the disturbance in the second medium would be proportional to a negative exponential, which would diminish very rapidly as the distance from the separating surface increased, so that at a very small distance from the surface, the disturbance would be quite insensible. This result enabled him, in a general way, to remove the objection which Newton had urged against the undulatory theory, because it furnished an instance in which the vibration did not sensibly spread beyond a certain surface; but, except so far as this, it did not give the least assistance in the solution of the question of total reflexion. The problem of determining the motion in the rarer medium —the insensible refracted motion—occupied also the attention of Fresnel; and, as he tells us himself, he meditated upon it for six years, without success. But he succeeded completely in discovering the motions of the *reflected* light, by a most ingenious interpretation of the formulæ which he had found for the usual case of partial reflexion, and which give imaginary results when the reflexion is total. Perhaps the rare sagacity of Fresnel was never more conspicuous than in this remarkable instance, in which he applied his formulæ to a case which they did not originally include, and thus succeeded in divining, as it were, the laws that he was in search of. But these laws rested on no physical foundation; nor could they be made to do so without previously determining the laws of the insensible refraction with which they are necessarily connected. To find the laws of insensible refraction, it was necessary to know the general differential equations for the propagation of light in a transparent medium; and to deduce from these laws the laws of total reflexion, it was necessary to know the general equations which subsist at the confines of two transparent media. Both these sets of equations were given, for the first time, by Prof. MacCullagh; the former having been originally published in the *Philosophical Magazine* for February 1836, the latter in the Proceedings of the Royal Irish Academy for December 1839. The equations had been first applied to the solution of the problem of reflexion and refraction, when the reflexion is partial and the refraction sensible, giving rise to one or two visible refracted rays; which is the simpler case, and was therefore the first solved, the solution having been given in the proceedings of the Royal Irish Academy at the latter date. But it was some months later before Mr. MacCullagh perceived that these same differential equations included also the laws of total reflection, and of the accompanying insensible refraction, the only difference between this and the former case being the assumption of more general expressions for the integral of the equations of propagation. The expression for the displacement parallel to each axis of co-ordinates now contains a negative exponential of which the exponent is a linear function of the co-ordinates, this exponential being multiplied by a quantity which contains, in general, both the sine and cosine of the phase. By reason of this exponential, the vibrations in the rarer medium rapidly decrease in magnitude as the distance from the surface of separation increases, becoming insensible at a very small distance from that surface; and when the aforesaid expressions for the displacements are substituted in the equations of propagation, we get certain relations among the constants, which relations are in fact the laws of the insensible refraction. The laws of the totally reflected light are then easily deduced, by means of the equations which subsist at the separating surface. It is to be observed that the reflection is not *assumed* to be total, but is *proved* to be so, from the equations last mentioned; and the laws of this reflexion come out the very same (for ordinary media) as those discovered by Fresnel in the singular way before alluded to. On account of the novel character of the laws of insensible refraction, Mr. MacCullagh entered into some details respecting them. The vibrations are in this case *elliptical*, every particle of the rarer medium describing an ellipse, which has the directions and the *proportion* of its axes every where the same; but the *magnitudes* of its axes rapidly diminish as the distance of the particle from the common surface of the media increases. It would, however, take up too much space to go into these laws, which will be published in the Transactions of the Royal Irish Academy. The problem of total reflexion was considered by Fresnel only with reference to two ordinary media. The preceding method, however, is general, and solves the problem in its widest extent. The most complicated case is that in which the rarer medium is supposed to be a doubly refracting crystal, the crystal being covered with a fluid of greater refractive power than itself, so that total reflexion may take place at the common surface. We then have insensible refraction within the crystal, and it is found that this refraction is *double*, giving rise to two insensible waves, in each of which the vibrations are elliptical. The laws of this *insensible double refraction* are very general, and include, as a particular case, the laws of double refraction discovered by Fresnel.

The SECRETARY then read Sir J. W. F. Herschel's 'Report on the Nomenclature of the Stars.'—The Committee reported that certain celestial charts of great merit have recently appeared in Germany, and that others are in progress of publication, which, if answerable to the expectations they have been led to form of them, may influence their decision both as to the names and boundaries of the constellations; they consider it desirable, therefore, to defer their decision till they shall have been enabled to consult these works.

Prof. LLOYD read a paper 'On the Regular Variations of the Direction and Intensity of the Earth's Magnetic Force.'—In this communication the author has given the principal results of the series of observations which have been made at the Dublin Magnetical Observatory, as far as they have been yet reduced. These observations were commenced in the beginning of the year 1839, and have been continued, almost without interruption, to the present time. Since the beginning of the year 1840, they were taken every two hours, day and night, in accordance with the general plan of observation laid down by the Royal Society. The elements directly observed are the *declination* and the *two components* (horizontal and vertical) *of the intensity*, and from the variations of the latter, those of the *total intensity* and *inclination* are readily deduced. The means of observing the vertical component of the intensity having proved not altogether satisfactory, another instrument has since been contrived by the author, by which the changes of the inclination are given directly. Prof. Lloyd would not occupy the time of the meeting with any account of the instruments or methods of observation, which are now sufficiently known by all interested in the subject of terrestrial magnetism, but would proceed at once to the results obtained, so far as they related to the regular changes of the magnetic elements, commencing with the *diurnal changes*. These variations were projected in curves, which represented the course of the mean daily changes for the entire year, for the summer and winter half years, and for each month separately.

Declination.—The mean daily curve of the changes of declination for the entire year exhibits a small easterly movement of the north end of the magnet during the morning hours, which reaches its maximum about 7 A.M. After that hour, the north end moves rapidly westward, and reaches its extreme westerly position at 1h 10m P.M. It then returns to the eastward, but less rapidly, the easterly deviation becoming a maximum about 10 P.M. The mean daily range = 9.3 minutes. During the summer months the morning maximum at 7 A.M. is more marked; the evening maximum, on the contrary, disappears, there being a slow and regular movement of the north end to the eastward from 7 P.M. until 7 A.M. In winter, on the other hand, the evening maximum is well defined, and the morning maximum disappears, there being a slow and regular westerly movement until 9 A.M., after which the movement becomes more rapid in the same direction. The epoch of the extreme westerly position of the magnet is nearly the same throughout the year. The greatest daily range, in summer, is about 13.7 minutes; the least range, in winter, about 7.2 minutes.

Horizontal Intensity.—The mean daily course of the horizontal force, for the entire year, has two maxima and two minima. The first minimum occurs between 1 A.M. and 3 A.M., which is followed by a maximum about 5 A.M., or a little after. These fluctuations are small. A second and principal minimum takes place at 10h. 10m. A.M.; and a second, or principal maximum, about 6 P.M. The mean daily range =.0024 of the whole intensity. In the summer months the smaller maximum and minimum disappear, the intensity decreasing continually throughout the night, but slowly, until 5 or 6 A.M., after which the decrease becomes rapid. There are, consequently, but one maximum and one minimum in the mean daily curve, which correspond nearly in epoch with the principal maximum and minimum of the curve for the entire year. In the winter months, on the other hand, there are three maxima and three minima, the evening maximum appearing to break into two. The epoch of the morning maximum moves forward as the time approaches the winter solstice, appearing to depend upon the hour of sunrise, which it precedes by a short interval. The epoch of the principal minimum is nearly constant throughout the year. The daily range is greatest in the month of July, when it is about .0045 of the whole intensity; it is least in the month of January, being then about .0008 of the whole.

Total Intensity and Inclination.—The total intensity appears to vary very little throughout the day. It seems to be least about 9 A.M., and then to increase, attaining a double maximum in the afternoon. The total range, however, being very small, the variations of the two components of the intensity are dependent chiefly upon the changes of the inclination. The inclination is greatest between 10 h. and 10 h. 30 m. A.M., and least about 6 P.M., the epochs corresponding with those of the least and greatest values of the horizontal intensity. The daily range is about two minutes in the early part of the year, and increases to more than double of that amount in summer. If we combine the changes of declination and inclination, the former being multiplied by the cosine of the absolute inclination, we obtain the whole movement of the north end of the magnet in free space, or the curve formed by the intersection of the magnetic axis with the sphere whose radius = unity. The whole movement during the first six hours of the day is inconsiderable. It appears, on a review of these facts, that the diurnal changes in the direction of the magnetic force are (as might be expected) connected with the diurnal movement of the sun, and its times of rising and setting. The changes of the intensity appear to be influenced in addition by some other cause, or by the same cause operating less directly. Prof. Lloyd concluded his paper by an account of the annual changes in the magnetic force at Dublin, as far as they have been hitherto determined.

Col. SABINE said, that the labours of Prof. Lloyd in this department of physical research were most important and extensive; yet he was happy to inform the Section that there was now in the room a foreign scientific gentleman, Dr. Langberg, of Norway, the minuteness of whose researches even exceeded Prof. Lloyd's; for whereas these observations were made every two hours during day and night, the observations of Dr. Langberg were made at intervals of only ten minutes day and night.—The DEAN OF ELY inquired whether the results of those most laborious observations had yet been published. —Dr. LANGBERG replied that a portion of them had been published in Gauss and Weber's Resultate.

'On the Circumstances which affect the Energy of Artificial Magnets,' by the Rev. W. Scoresby, D.D. —The object of this communication, Dr. Scoresby

Digitized by Google

stated, was not to enter into the extensive bearings of the subject announced, which the time of the Section would not allow; but he might just state, in general terms, that the energy of permanent artificial magnets, of which alone he designed to speak, was affected by a considerable variety of circumstances, all acting by laws peculiar to themselves, and thus occasioning differences in the resultant energy whenever any of the circumstances might be changed. These circumstances comprised quality of steel, denomination (such as cast steel, shear steel, blister steel, &c.), temper or hardness, mass, and form. Hence, from the varying influence of these several circumstances, it was impossible to give a general answer to the inquiry, as to the best kind and temper of steel for permanent magnets. In large magnets, indeed, consisting of considerable combinations of bars or heavy masses, he, Dr. Scoresby, had sufficiently determined the fact, that best cast steel, made as hard as possible, was the most effective; but for small magnets or thin compass needles, other steel, or cast steel tempered, became most effective. In a six-inch bar which he exhibited, of 600 to 700 grains' weight, hard cast steel was advantageously employed; but in thin plates, used singly or in pairs, such hardness required to be reduced. But by extensive investigation of the effects of these several conditions, if any particular case were stated, he could easily determine the requisite qualities. That the power of a magnet was essentially dependent on both *quality* and *hardness*, he, Dr. Scoresby, proceeded to show by experiment with four small bars of similar size, but different qualities or tempers. One lifted only 600 grains, another about 1,000, another the same, another 3,200 grains. Tried by Dr. Scoresby's mode of testing, described last year, he found the first to be bad in quality; the second inferior, and too soft; the third good in quality, but not hard enough; the last excellent in quality and hardness. On being laid in succession upon the test bar, the first three lost all their power, whilst the last retained still the power of lifting a key of 3,200 grains' weight. Two anomalies in practical magnetism were then described. First, the experimentally determined fact, that proportional magnets of similar steel and temper were not energetic proportionally with their masses; in other words, that two magnets, one, for instance, being double in all its dimensions of the other, would not exhibit powers corresponding with their masses, or in proportion to the cubes of their lengths,—the proportions instead of being as $1^3 : 2^3 = 8$, would perhaps be found to be as 1 to 5 or 6 only. Hence it would be inferred that magnets could not be advantageously enlarged to an indefinite extent; at the same time, from the experiments already made, he, Dr. Scoresby, would have no difficulty in constructing a magnet of a ton weight, and, by means of his peculiar test (which he exhibited to the Section), of rendering every bar effective. The other anomaly to which he referred, was that arising out of difference of form. In all his experiments, on more than 1,000 bars or plates, he had always found that extreme hardness was the most effective in large or considerable combinations of straight bar magnets. His surprise was therefore great, on trying the same principle on two horse-shoe magnets of five and fifteen bars, to find that the same law did not prevail. The magnets, until reduced in temper, were of low power. To reduce them by a fixed and determinate rule, he, Dr. Scoresby, adopted a bath of oil, boiling at about 600°. He tried the effect of various temperatures, from 300° to the boiling, and thence determined the ratio of improvement until he obtained the best. The magnets, annealed ultimately at a uniform temperature of 505°, now exhibited very superior powers, lifting from seven to nine times their own weight.

The Dean of Ely pointed out the great practical value of these researches, as bearing directly upon the proper construction of ships' compasses. He suggested, that unless Dr. Scoresby took the trouble of reducing these valuable observations to some more permanent form, and publishing them, they would be lost.—Dr. Scoresby replied that he had tabulated the results, and laid before the Physical Section at Manchester diagrams which placed before the eye at a glance the most important of these results, and that he was making preparations to publish them in a separate form. Another object which he contemplated, was the connexion of the best form of magnet with the economical production of power; and he had little doubt that the magnet would yet be used for the production of motive force. Whenever that was the case, he felt assured the permanent magnet would be found more economical than the galvanic battery. As matters stood, even now he could engage to produce, if requisite, a magnet of over a ton in weight.

'Description of a Galvanometer,' by Mr. J. P. Joule.—It is a well-established principle in electrodynamics, that if a small magnetic needle be suspended in the centre of a coil or helix, and in the plane of its axis, the tangents of its deflections will be nearly, but not exactly, proportional to the quantity of current passing through the coil. It has, therefore, been found necessary to construct tables for turning the deflections of the needle into quantities of current. The necessity of forming these tables was first insisted upon by M. Becquerel; and in his Treatise on Electricity he has pointed out the laborious experimental processes employed by himself and others in their construction. It is obvious that one table would suit all instruments possessing the same relative proportions. And the instrument which Mr. Joule presented to the notice of the Association, was designed as a *type* for the construction of galvanometers. It consisted of a needle, three inches long, suspended in the centre of a coil of six inches diameter. By a simple mechanical contrivance the coil could be removed from the instrument, and replaced by others adapted for the measurement of currents of different quantities and intensities; but in all cases their dimensions were to be exactly similar, and their diameter exactly twice the length of the needle. A most important part of the instrument was the needle, which was constructed on Dr. Scoresby's principle, and consisted of two straight and perfectly hard pieces of watch spring, placed at a distance from each other of about ⅛ of an inch, the agate cap being fixed between them. The importance of this form of needle consisted in the facility it presented of constructing different needles perfectly similar to one another with regard to the distribution of magnetism in them, which is essential to the accuracy of the same table applied to different instruments.

Sir W. R. Hamilton presented the result of some investigations connected with the Calculus of Probabilities. The advantage of the method therein proposed is, that the auxiliary variable (which he calls the "argument of probability," and suitably determines,) depends, in general, more simply than the probability itself, on the conditions of a question; while the introduction of this new conception and nomenclature allows some of the most important known results respecting the mean results of many observations to be enunciated in a simple and elegant manner.

The Dean of Ely observed, that the value of the communication just laid before the Section by Sir W. Hamilton could scarcely be appreciated by those not acquainted with the fact, that it is by the aid of formulæ furnished by this calculus that observers were now universally in the habit of estimating the degree of dependence to be placed on all astronomical observations, and on the experiments which were the foundation of every branch of physical inquiry.

'On the Changes which Bodies undergo in the Dark,' by Mr. R. Hunt.—At the last meeting of the British Association great interest was excited by the announcement of a discovery by Möser, of Königsberg. This discovery was, that all bodies were capable in the dark of impressing their forms upon other bodies brought near them. Since that period three papers have been published in the Scientific Memoirs, which fully set forth the views entertained by Möser; and the subject has occupied the attention of Prof. Draper, of New York, of Mr. Prater and others in England, and also of Fizeau in France. Both Professors Möser and Draper attribute the phenomena to the radiation in darkness of light which has been absorbed, and which remains latent in all bodies; while Fizeau seeks to explain them by the existence of films of organic matter, which are easily disturbed, and in this view he is followed by Sir David Brewster, by Prof. Grove, and to a considerable extent by Mr. Prater. For the purpose of testing these hypotheses, Mr. Hunt made the following experiment. Three flat bottles, manufactured for Mr. Hunt's experiments on the influence of light on plants, were carefully prepared with three differently coloured fluids. An intense solution of carmine in ammonia, which admitted the permeation of the red rays only; a strong solution of the sulphate of chromium, through which but a portion of the most refrangible red and the orange and yellow rays only passed; and the ammonia sulphate of copper, which absorbed all but the most refrangible portion of the spectrum. Thus were obtained the means of isolating, with a tolerable degree of purity, the calorific, the luminous, and the chemical spectra. Having several designs cut out of white paper, these were placed on copper plates, and being covered with the above bottles of fluids, placed in the sunshine. After remaining exposed for different periods at different times, from half an hour to three hours, they were brought from the light, and the plates placed in the mercurial vapour box, and subjected to its influence. In no instance did any impression appear on the plates which were placed under the blue or yellow fluids, but in every case most decided impressions on those plates which were subjected to the influence of the red rays. Indeed, in some cases the impressions were beautifully visible without the use of mercurial vapour. It does, therefore, appear, when we take into consideration besides the above facts, also the fact which has been admitted, that artificial heat, at least, accelerates this molecular change, that an amount of evidence has been obtained in favour of the hypothesis of calorific disturbance, superior to the supposed evidences in favour of the absorption and radiation of any other solar emanation. From another series of experiments made with washed and unwashed plates, Mr. Hunt concluded that organic matter is not the cause of these images; but that the effect is due either to some disturbance of the latent caloric, which produces a molecular change, or to a thermo-electrical action, which it is difficult to understand. Had the effect been due, as M. Fizeau has stated, to slight layers of organic matter of a volatile nature, it appears natural to suppose that these mysterious images would have been found only on the very surfaces of the plates. Now this is far from being the case. These images are often found to be impressed to a great depth into the metal. Mr. Hunt in many cases removed several surfaces of copper, and yet had been able to revive the images. He possessed copper plates rendered useless by the impressions, which he has in vain endeavoured to remove.

Mr. Nott thought it idle call in the aid of Mr. Draper's Tithonic rays to perform an office for which the well known and understood principles of electricity would, as he conceived, be amply sufficient to account, as there was always electricity developed upon the contact of two dissimilar bodies.—Mr. Hunt leaned to the opinion, that those who maintained that electricity was never developed by simple contact, come nearer to a correct interpretation of all the known facts.

Section B.—CHEMISTRY AND MINERALOGY.

'Chemical Suggestions on the Agriculture of Cork,' by Thomas Jennings, Esq.—The author drew attention to the present state of Agriculture in the south of Ireland, and to the immense importance of some system by which the value of the limestones and sands of the district might be carefully ascertained by good chemical analysis. Two kinds of limestone were found in the neighbourhood of Cork, the variety which yielded the best lime for building was found to be very inferior to the other as a manure. The sands from the bed of the river Lee, and many of the sea sands were used as manure with very uncertain results. The author suggested the propriety of having correct analyses made, and large masses of the rock, or of the sand, placed in some museum, where the results of careful analysis should be registered.—Dr. Kane thought that the impulse given by the celebrated work of Liebig was rather likely to tend to injury than otherwise. Agriculturists were led to expect great results from the application of chemistry to agriculture, and imagined that they might have all the advantages of the science without incurring any expense.—Dr. Apjohn concurred in the justice of Dr. Kane's remarks.

'Some Remarks on the Chemistry of the Arsenites,' by J. Apjohn, M.D.—This paper contained an account of some desultory experiments, made with

Digitized by Google

the view of obtaining a more exact knowledge of the Arsenites than can be acquired from books. Although a valuable addition to toxicological chemistry, it was wholly of a technical character, and offered no general truths or discoveries which could render it interesting beyond the laboratory.

'On the Calorific Effects of Magneto-Electricity, and the Mechanical Value of Heat,' by Mr. J. P. Joule.—Although it has been long known that fine platinum wire could be ignited by magneto-electricity, it still remained a matter of doubt whether heat was evolved by the *coils* in which the magneto-electricity was generated: and it seemed indeed not unreasonable to suppose that *cold* was produced there, in order to make up for the heat evolved by the other parts of the circuit. The author had endeavoured therefore to clear up this uncertainty by experiment. His apparatus consisted of a small compound electro-magnet, immersed in water, revolving between the poles of a powerful stationary magnet. The magneto-electricity developed in the coils of the revolving electro-magnet, was measured by an accurate galvanometer; and the temperature of the water was taken before and after each experiment by a very delicate thermometer. The influence of the temperature of the surrounding atmospheric air, was guarded against by covering the revolving tube with tinfoil, &c., and by the adoption of a system of interpolation. By an extensive series of experiments with the above apparatus the author succeeded in proving that heat *is* evolved by the coils of the magneto-electrical machine, as well as by any other part of the circuit, in proportion to the resistance to conduction of the wire and the square of the current; the magnets, having, under comparable circumstances, the same calorific power as the voltaic electricity. Prof. Jacobi, of St. Petersburgh, had shown that the motion of an electro-magnetic engine generates magneto-electricity in opposition to the voltaic current of the battery. The author had observed the same phenomenon on arranging his apparatus as an electro-magnetic engine; but had found that no additional heat was evolved on account of the conflict of forces in the coil of the revolving electro-magnet, and that the heat evolved by the coil remained, as before, proportional to the square of the current. Again, by turning the machine contrary to the direction of the attractive forces, so as to *increase* the intensity of the voltaic current by the assistance of the magneto-electricity, he found that the evolution of heat was still proportional to the square of the current. The author discovered therefore, that the heat evolved by the voltaic current is invariably proportional to the square of the current, however the intensity of the current may be varied by magnetic induction. But Dr. Faraday had shown that the chemical effects of the current are simply as its quantity. Therefore he concluded that in the electro-magnetic engine, a part of the heat due to the chemical actions of the battery is lost by the circuit, and converted into mechanical power; and that when the electro-magnetic engine is turned *contrary* to the direction of the attractive forces, a *greater* quantity of heat is evolved by the circuit than is due to the chemical reactions of the battery, the overplus quantity being produced by the conversion of the mechanical force exerted in turning the machine. By a dynamometrical apparatus attached to his machine, the author ascertained that, in all the above cases, a quantity of heat, capable of increasing the temperature of a pound of water by one degree of Fahrenheit's scale is evolved with the magnetism which possesses a force sufficient to raise a weight of about 874 pounds to the height of one foot.

'On a new method of testing the Hygrometric Formula usually applied to observations made with a wet and dry Thermometer,' by J. Apjohn, M.D.—Some years ago Prof. Apjohn communicated to the Irish Academy a formula for inferring what is called the dew-point, from observations of the wet and dry thermometers alone, and he considered the accuracy of his formula as fully established by three experimental tests, which he explained in a memoir read to the same learned body. "But finding," he says, "that some still doubted, I thought it might be as well to give publicity to a fourth method of verification which I have lately employed, and which has in the fullest manner sustained the general conclusion to which the previous test experiments had conducted. It is well known that if unity represents the specific gravity of dry atmospherical air at the temperature of 60°, and under a pressure of 30, that its specific gravity at the temperature t'', and under the pressure f'' will be represented by the expression

$$\frac{521}{461+t''}\times\frac{f''}{30}$$

Now if we suppose the air at t'' to be saturated with moisture whose elastic force is f'', the specific gravity of the aqueous vapour will be $\frac{521}{461+t''}\times\frac{f''}{30}\times.625$, the latter factor being the density of vapour in relation to air having the same temperature with it, and existing under the same pressure. The air, however, being not at its dew-point, but at some higher temperature t, in order to obtain the specific gravity of the vapour at this latter temperature, the expression already got must be multiplied by $\frac{461+t''}{461+t}$, by which it will become

$$\frac{521}{461+t}\times\frac{f''}{30}\times.625.$$

This, then, is the exact specific gravity of aqueous vapour in air, whose temperature is t, and whose dew-point is t''. And multiplying this by .31 v, .31 being the weight of one cubic inch of atmospheric air, and v the volume, or number of cubic inches of air,

$$\frac{521}{461+t}\times\frac{f''}{30}\times.625\times.31\ v=\frac{3.3647\,f''}{461+t}\times v$$

is the weight of v cubic inches of aqueous vapour whose maximum tension is f'', and existing in v cubic inches of air whose temperature is t. Let us suppose this quantity to be determined by experiment, and to be represented by w. Then,

$$\frac{3.3647\,f''}{461+t}\times v=w, \text{ and}$$

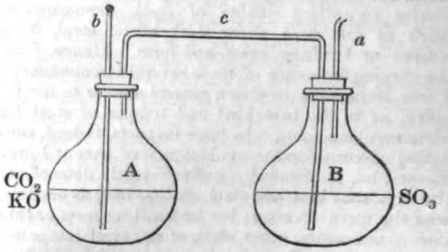
$$f''=\frac{w}{v}\times\frac{461+t}{3.3647}.$$

Knowing therefore w, which may be got very accurately by experiment, we can calculate f''. But, by the hygrometric formula,

$$f''=f'-\frac{t-t'}{87}\times\frac{p-f'}{30}$$

this latter value should, of course, be equal to the former; and without detaining the Section with the actual numbers which I have obtained, I may state that the method just explained has completely established the accuracy of the expression which gives the force of vapour at the dew-point in terms of the difference of temperatures of the wet and dry thermometer, of the pressure of the air, and of the tension of vapour at the temperature indicated by the instrument, whose bulb is kept moist.

I have only in conclusion to state that the quantity w is got by slowly passing, by means of an aspirator, a known volume of atmospheric air through a system of two tubes, one of which is packed with small fragments of chloride of calcium, and the other with asbestos moistened by oil of vitriol.



TUESDAY.

'On the Minerals of Cork,' Mr. R. W. Townsend.—A series of minerals, all of them collected by Mr. Townsend, was exhibited. This collection included some beautiful specimens of copper pyrites, grey copper, and malachite, manganese ores of a fine character, and some rare iron ores, and may be regarded as giving a fair view of the mineralogical condition of the county.

Mr. Townsend also exhibited a specimen of manganese taken from the deposit formed by a thermal spring near the Cape of Good Hope. The water issued at a temperature of 110°, and so large was the quantity of manganese, which, in some form, it held in solution, that a very thick incrustation lined the stream within a short distance of the spring.

Report of the Progress made in the Inquiry into the State of the Iron in the Axles of Locomotive Engines, by W. Lucas, Esq.—Little or no progress has yet been made in this inquiry, the Report on which is, therefore, deferred till the next meeting of the Association. Iron of the first quality, and which breaks with a fine fibrous texture, becomes, by cold swaging, changed into a crystalline texture, and consequently brittle. It is again restored by annealing to its first fibrous state. It has been found by experiments that mere concussion, without any hammering, suffices to produce the same crystalline structure.

Abstract of a letter from Dr. Will, of Giessen, 'On an improved method of ascertaining the commercial value of alkalies or carbonated alkalies, acids, and oxides of manganese.'—The apparatus by which this determination is effected consists of two small glass flasks, A and B, connected by the bent tube *c*, which passes through corks in the necks of the flasks.

Into the flask A is put the solution of the substance to be tried, and into B is put concentrated sulphuric acid. Two other tubes pass through the corks in the flasks—the one, passing through the cork of A, dips below the surface of the solution, and is closed with a small piece of wax, while the one in B is left open, and does not reach below the fluid contained in it. Suppose the flask A to contain a weighed quantity of a solution of a carbonate, then a known quantity of sulphuric acid is introduced into B, and the whole apparatus weighed: the tube *b* being then closed with wax, if air be blown into *a*, a portion of the sulphuric acid passes over through the tube *c* into the flask A, and comes in contact with the carbonate. The consequence is an evolution of carbonic acid, which must go through the concentrated sulphuric acid, and is thus made perfectly dry. When all the carbonate is decomposed, the piece of wax on the tube *b* is removed, and air sucked through the tube *a*, in order to remove all the carbonic acid. The apparatus is then to be weighed, and, from these data, the quantity of alkali combined with carbonic acid may be easily calculated. The same method is applicable to the acids, particularly to vinegar, which was till now a very tedious and, at the same time, a very inaccurate operation. Dr. Will considers that the value of soda or potash can be thus determined with much greater accuracy than according to the method of Descroizell, improved by Gay-Lussac. If a soda contains a sulphite or a hyposulphite, which is almost always the case, the alkalimetrical method in use at present gives quite wrong results: the same is the case if potash contains phosphates, silicates, &c. Full details, with tables, will be given in a pamphlet, which will shortly appear, translated into English.

'On the Relative Electro-Negative Powers of Iodine and Fluorine,' by Rev. T. Knox.—The object of this paper was to controvert the statement made by Brande in his 'Chemistry,' that the fluorides are not decomposed by chlorine or iodine; and to show, as the result of experiments, that fluorine has been erroneously placed above iodine as a negative element.

'On the Electricity of High Pressure Steam, and a description of a Hydro-Electric Machine,' by W. Armstrong, Esq.—This paper recapitulated all that has been done in this very interesting inquiry. The author assents to Dr. Faraday's opinion, that the force with which the particles of water are rubbed against the glass, is, in this case, the cause of the developement of electricity.

'Eulogium on the late R. Kirwan, Esq. L.L.D.' by Dr. Pickells.—The author traces the progress of this very distinguished philosopher from the period when, by the death of his brother, who was accidentally shot while entering the Irish House of Commons, he retired from the bar. For his first efforts, a series of essays, he received the Copley medal, and he was elected a member of the Royal Irish Academy. Chemistry and mineralogy were the sciences to which Mr. Kirwan particularly applied himself. He was fond of metaphysics, and wrote a volume on logic. He also bestowed much attention on meteorology, and his essay on the variations of the barometer has obtained the approbation of Dalton and others.

'On the late Fires at Liverpool, and on Spontaneous Combustion,' by Mr. A. Booth.—This communi-

Digitized by Google

cation consisted merely of an enumeration of cases in which fires had, as it was supposed, originated in the spontaneous combustion of material used in manufactures—and the author suggested the propriety of the Association influencing government to institute an expensive series of experimental inquiries in this class of phenomena, which are but ill understood.

MONDAY.

SECTION C.—GEOLOGY AND PHYSICAL GEOGRAPHY.

'On the Granite and other Volcanic Rocks of Lundy Island,' by the Rev. D. Williams, F.G.S.—Mr. Williams described this island as a mass of grey granite, three miles long by about half a mile wide, flanked at its S.E. angle by slate rocks, which, beyond the immediate influence of the granite, had an E. and W. strike, and extended for about half a mile. The circumstances attending the granite were altogether unlike those of any granite mass of Devon or Cornwall. The usually abundant evidences of the processes by which the bounding rocks had been reduced and converted into granite in the vast volcanic laboratories, were all absent. He could not discover a vestige of a granite vein, nor could he observe any where a trace of gneiss, mica, or chiastolite slate. In Devon and Cornwall, he had often observed that the mineral characters of granite, especially in the veins, varied with the lithological constitution of the sedimentary or other rocks, out of which it had been derived, and with which it was so intimately associated. Besides, the incorporation, the welding, as it were, of the granite in veins with the sedimentary rock, was commonly so perfect that it was altogether impossible to separate them. Now at Lundy Island, although he had repeatedly tried at several visits, he never had succeeded in detaching a specimen of slate united with either the granite, trap, or porphyry, though it was considerably indurated and altered by them, and otherwise in precisely the same condition as the slates in Cornwall. He proposed, in reference to the agency of heat on rocks contiguous to igneous masses, to distinguish between *active* and *inert* heat—the former exerted in reducing the minerals to fluids, the latter simply indurating and otherwise partially altering them. The junctions of the slate and granite at Lundy, which were very clearly exposed on the N.E. and the S.W. evidenced nothing more than the operation of inert heat: the granite there was manifestly older than the slates; the slates were older than the traps; and the traps which traversed slate and granite were older than the porphyries, which cut off and shifted the traps.

'On the Discovery of the Remains of Fish, and other Fossils in the Killas of Cornwall,' by Mr. C. W. Peach.—These remains were discovered in the slaty rocks ranging E. and W. of Palperro: they occurred in tolerable plenty, though usually in a fragmentary condition. The most marked specimens appear to be fragments of the bony plates of Cephalaspis, the spine of Onchus, and the dermal covering, or shagreen, of the Sphagodes. The author also stated that he possessed a larger specimen, containing apparently the scales of a ganoid fish. At Goran he found a conglomerate in which are large rolled masses of limestone, with orthoceratites, crinoidea, and corals; and at Great Peraver there is a quartz rock, full of organic markings, resembling the tribes of the recent Sabellaria of the coast.

Mr. MURCHISON observed that this discovery confirmed, in a very remarkable manner, the view which Mr. Sedgwick and himself had taken of the age of these rocks. Those fish-remains appear to belong to the Upper Silurian, the oldest rocks in which the remains of any vertebrated animals have been discovered, and they occur in rocks forming the axis of S. Devon, which he had always considered the oldest in that country.—Mr. PHILLIPS stated, that the earliest discovery of remains of fishes in the slate rocks of Cornwall was announced in Sir H. De la Beche's Report; and he had himself figured in his 'Palæozoic Fossils' the scale of a holoptychius, found in rocks lower than the Plymouth limestone, agreeing, however, more nearly with a species from the carboniferous series than with that of the old red sandstone. Mr. Phillips regarded the fish-remains discovered by Mr. Peach as equally related to the carboniferous and Silurian forms, and probably belonging to an intermediate position, on a parallel with the cornstones of Herefordshire.

'On some Beds of Limestone in the Valley of Cork,' by C. Y. Haines, M.D.—This outlying portion of the carboniferous system is described as consisting of three thin beds of ferruginous limestone, interstratified with carboniferous slate and yellow sandstone, forming part of a series underlying the limestone of the Cork valley; it is situate at Riverstown, and crops out at the summit of an anticlinal elevation; the limestone and slate contain Encrinites, Turbinoliæ, Spirifers, &c. Dr. Haines also exhibited some rare and undescribed fossils from the Cork limestone, and a slab of millstone grit from Kilrush, County Clare, containing some new and extraordinary impressions, apparently of a marine Annelid, slightly resembling a species of Myrianites figured in Mr. Murchison's Silurian system, and occurring in the Cambrian slates.

Mr. GRIFFITH observed, that he had not been previously acquainted with this particular locality: he had no doubt these bands of limestone occurred at many other localities.

'On the old Red Sandstone, or Devonian, and the Silurian Districts of Ireland,' by R. Griffith.—The author stated that he should consider these two systems together, on account of the difficulty of separating the Silurian strata, which were characterized by fossils, from the Devonian, which in Ireland were only known by position and mineral character. The most northern district coloured as old red sandstone on Mr. Griffith's map, extends from Enniskillen, in the county of Fermanagh, to Pomeroy, in the county of Tyrone; and from Lisbellaw to Lisnarick, in the county of Fermanagh, occupying an area of about 300 square miles. To the north and north-west it is bounded by granite and metamorphic rocks, and to the east, south, and south-west by the carboniferous strata of Tyrone and Fermanagh. The lower beds of the latter series are usually unconformable to the brownish red sandstone and conglomerate of the system beneath. The second district of red sandstone described by Mr. Griffith forms a narrow ridge, known as the Curlew Mountains, and extends from Drumshambo, at the foot of Lough Allen, County Leitrim, in a western direction, by Moygara to Mullaghanoe Hill, in the county of Sligo, a distance of thirty-two miles, the breadth of the district being seldom more than three miles, and the greatest elevation 863 feet. The strata consist of a reddish-brown sandstone, covered unconformably by carboniferous rocks, and alternating with shale, and conglomerate which is occasionally trappean. North of Ballaghdeneen, County Mayo, there is a considerable tract of metamorphic conglomerate, passing sometimes into semi-porphyry, and at other localities becoming schistose, and passing into compact brown shale. In the midst of the metamorphic porphyry at Egool, immediately to the south of the Mountain of Mullaghanoe, is a series of rocks composed of alternations of brownish red sandstone and shale, greenish grey quartzite and slate, and impure limestone. Out of nineteen species from this limestone which occur in England, three belong to the Caradoc sandstone, three are common to the Caradoc and Wenlock formations, and sixteen to the Wenlock and Upper Silurian. Another district of the red sandstone and conglomerate is situated to the north of Castlebar, and occupies the same geological position in regard to the carboniferous series, as those already mentioned, but as yet no fossilliferous beds have been discovered within its limits. At Kildare the author had discovered thirty-two species of fossils in a mass of limestone: of these, eighteen are described in Mr. Murchison's Silurian system, all of which occur in the Caradoc sandstone, five of them, however, being common to the Wenlock and upper rocks.

Mr. PHILLIPS remarked, that, as the red colour of rocks was due to local physical agents, it could be of little value in classifying strata, compared with the evidence derived from organic remains. The red rocks, however, generally marked conditions of the ancient sea, unfavourable to organic life, so that this principal source of evidence was often wanting.

'On the Important Additions recently made to the Fossil Contents of the Tertiary Basin of the Middle Rhine,' by R. I. Murchison, Esq.—After a sketch of the geographical limits and geological relations of the tertiary deposits which occupy the Valley of the Rhine and Mayne, around the towns of Mayence, Frankfort, and Darmstadt, Mr. Murchison gave an account of the recent discoveries made by M. H. von Meyer, M. Kaup, of Darmstadt, and M. Braun, of Heidelberg. Of the animals of this tertiary basin, M. von Meyer had catalogued and was preparing for publication, 68 mammifers, 30 reptiles, 13 birds, and 8 batrachians—nearly all being undescribed species, and most of them of small dimensions. Amongst the new animals discovered by M. Kaup, were mentioned the Chalicotherium, a genus allied to Anoplotherium and Lophiodon; the Hippotherium, differing from the recent Equus in the possession of an additional metacarpal bone, and a minute saurian, named *Pisodon Colei*. M. Kaup had determined from an examination of the remains of various species of rhinoceros, tapir, &c. occurring in this deposit, that the Fauna of the period presented a close affinity to the types of the Indian and Sumatran archipelago, and were entirely distinct from all known European mammalia. He had also collected a large series of mastodontoid remains, which completely proved the views of Prof. Owen, respecting the identity of the American Tetracaulodon with the true Mastodon. The invertebrata of the deposit have been examined by M. Alexander Braun, and have been found to comprise 450 species, 303 of which are mollusca, and 103 shells,—of which, ten species only were identical with living forms. Many of the shells approach closely in form to those in the Calcaire Grossier of Paris, and this circumstance, together with the occurrence of the Anthracotherium, and of an animal intermediate between the Anoplotherium and Palæotherium, makes it probable that the deposit belongs to the same age as the gypsum beds of Montmartre, and the Ryde and Binsted strata of the Isle of Wight. These tertiary beds are covered with gravel, sand, and löss, containing ninety-six species of shells, fifty-six of which are terrestrial, and forty fluviatile. Of these, seven belong to species now living, and nine others are probably varieties of existing species—the most abundant species are very rare in a living state, whilst those now common are of unfrequent occurrence in the löss. With the shells are associated the remains of mammoth, rhinoceros, tichorinus, &c., the bones of which have evidently received very little injury from diluvial action; and from the frequent occurrence of entire skeletons, Mr. Murchison infers that these superficial deposits were formed by very tranquil operations, and that the great mammalia inhabited tracts immediately adjacent to the spots where they are now entombed.

Mr. OWEN stated, that the Mastodon of the Mayence basin was identical with the species found in the Norwich Crag, which was likewise a fluvio-marine deposit. He had not seen any bones in the English tertiary or drift, which could be distinguished from the ordinary horse or zebra, excepting a few teeth, which were more curved than usual, and might possibly have belonged to the Hippotherium.

SATURDAY.

SECTION D.—ZOOLOGY AND BOTANY.

The Rev. W. HINCKS, of London, exhibited specimens of abnormal forms in the flowers of Fuchsia. He remarked that there were two series. The first, in which the petals, sepals, and stamens were arranged in *fives*, the second, in which the sepals were in *threes*, whereas four is the normal number on which the parts of the flowers are arranged in the whole order Onagraceæ. The normal number of the parts, in exogenous plants, is five. The first series, therefore, which exceeded the quaternary arrangement of its flowers, might be looked upon as abnormal. In the second series the number of parts was reduced by the adhesion of the parallel edges of two sepals.

Dr. LANKESTER traced the abnormal developement of flowers to an increase, decrease, or alteration in the nutrition of the plant. This might be effected by injury to the plant, or by removing it from the circumstances in which it naturally grows. In the instance of the fuchsia, it evidently arose from cultivation. By experiments of this kind, ready-made in Nature, we might deduce the general laws of the developement of plants.

Mr. STRICKLAND then read the Report of the Committee 'On Zoological Nomenclature;' and stated, that several hundred copies of the Report printed in the last volume of the Transactions, had been circulated, and that the rules therein laid down for zoo-

Digitized by Google

logical nomenclature were very generally approved of in this country and on the continent. He then read a paper 'On the Structure and Affinities of *Upupa*, Linn., and *Irrisor*, Lesson.'—The African genus Irrisor, of Lesson, has been classed by various authors in the genera Upupa, Merops, and Epimachus, but as it is distinct from all these, and also from Brisson's genus Promerops, by which name later authors have called it, the term Irrisor of Lesson becomes its legitimate appellation. The author of this paper contended, that the peculiar characters of the beak, common to Upupa and Irrisor, but found in no other known group of birds, indicate, not an analogy, but a real affinity between them, and must therefore, taken in connexion with minor points of agreement in the form and style of colouring of the wings, and in the mode of nidification, be considered to preponderate over the various points of difference. We must, therefore continue to class Upupa and Irrisor (together with Rhimopomastus, which is hardly distinguishable as a genus from the latter) in one and the same superior group, Upupidæ. The next question is, in what part of the natural system the group Upupidæ, so restricted, is to be placed? They are certainly a very insulated group, but the combination of a long beak with a short tongue seems to show an affinity in one direction to the Alcedinidæ, and in another they probably lead through Epimachus to the Paradiseidæ.

Prof. OWEN remarked that the author had alluded to the humming birds as living on honey; he believed they also took flies and other insects as food. The character of their flight and the structure of their stomach, adapted them for this kind of food.—Mr. Strickland knew, for a fact, that humming birds would live on sugar and water, although he made no doubt that they took insects whilst on the wing.

Mr. STRICKLAND read to the Section a Catalogue of the Birds found in Corfu and the Ionian Islands, by Capt. H. M. Drummond, 42nd R.H.—In this list, which is of considerable extent, Capt. Drummond has inserted many valuable observations on the habits and migrations of the birds which occur in the Ionian Islands. The total number of species, in the list, is 198;—of these 159 are British, 38 are found on the European continent, but not in Britain, and 1, the *Calamoherpe olivetorum*, Strickland, has hitherto been found only in the Ionian Islands, where it is very common during the summer.

The next paper was a similar list, by the same gentleman, of the birds of Crete, made during a visit to that island in May and June, 1843, in company with Capt. Graves of H.M.S. *Beacon*.—From the shortness of the author's stay in Crete, this list is less complete than the last, but embodies many interesting facts. The total of species observed, was 105, of which 86 are British and 19 continental. It is remarkable that the common sparrow of Crete is the *Fringilla cisalpina*, while, in the Ionian Islands, it is replaced by the *F. domestica*.—Mr. Strickland expressed his pleasure at the progress which Capt. Drummond had made in ornithological researches. Such lists were of great value in forming tables of the distribution of animal life, and he bore testimony to the accuracy of Capt. Drummond's observations.

Mr. STRICKLAND then exhibited to the Section the beautiful work of the Prince of Canino, called *Fauna Italica*, the fruit of ten years' labour. The Prince had, unfortunately, been prevented from attending this meeting, in consequence of the approaching scientific congress at Lucca, in September, but he had promised to be present at the meeting next year.

Mr. THOMPSON observed, that these lists of birds were more extensive and complete, than those of the French expedition to the Morea, in which several naturalists were engaged. He then exhibited to the Section, a specimen of the *Pycnonotus chrysorrhœus*, Swainson, shot near Waterford in January 1838, and belonging to Dr. Burkitt, of that city. This species of bird is a native of Africa, and has not before been noticed as visiting Europe. Mr. Strickland said this bird was quite new to the British Fauna. It was an extraordinary fact, that it should have been shot in this country in January, seeing it is a bird of tropical climates.

Mr. R. BALL, of Dublin, exhibited a specimen of *Cuculus glandarius*, which he had shot near Galway. He was sorry these rare birds were shot at so often, as in this manner all the individuals were destroyed, and birds that might become naturalized, were thus exterminated.

Mr. THOMPSON stated, that this was an interesting addition to the Fauna of Ireland, and that Mr. Ball had previously first observed the Carolina Cuckoo, as a native of Ireland.

Dr. LANKESTER then read a list of birds, and the date of their appearance and disappearance, at Llanwrest, in South Wales, drawn up by Mr. Blackwall.—This paper excited some discussion as to the causes which determined the acclimatization of birds and other animals.

Dr. LANKESTER then read the Report of the Committee appointed to inquire into the Varieties of the Human Race.—The Report stated, that the queries drawn up by the Committee for the purpose of eliciting further information on the varieties of the human race had been extensively circulated, and that many travellers, missionaries, and others had expressed their sense of their value in assisting them in their inquiries concerning the inhabitants of various parts of the world. It expressed a wish, on the part of the Committee, for a further grant, in order that they might more effectually carry out the objects they had in view. The value of the queries issued by the Committee, would be seen in the answers given to them by Mr. Heath from the Navigators Islands and New Hebrides.

Mr. HEATH then read a paper, 'On the Physical Character, Languages, and Manners of the People of the Navigators Islands.'—The islanders were described as a fine race of people, the average size rather above that of Europeans—the colour brunette, the face oval, the hair black and rather crisp, and the eyes a fine black. Their language is at present scarcely known to philologists. It is spoken by about 60,000, and is a dialect of the wide-spread Polynesian. One of its marked peculiarities is, its reciprocal conjugation of the verb. Mr. Heath had entered very fully into a comparison of the Samoan with the Malay, and of several of the Polynesian languages among themselves, and of some of the Papuan dialects, and had obtained extensive vocabularies. With regard to individual and family life, the child is named after the god whose name is last invoked prior to the moment of birth. The mothers slightly press the forehead so as to give it a conical form: they rear their children tenderly. Circumcision is practised. They believed in a future state, but had rather loose and inconsistent notions as to what sort of state it is; some, they said, became gods, some were eaten by the gods, and the chiefs became living pillars in a large temple. The tradition with them is, that they came from the westward, and their elysium is Pulo-tu. Since Pulo is the name for island, this also indicates their origin. They are an intelligent people, and manifestly capable of improvement. The people of Tanna and the neighbouring island are in stature about five feet six or five feet eight, the legs rather short and ill-formed: they are neither so well-formed nor well-featured as the Samoans and other Polynesians. The complexion is the colour of dirty or worn copper coin, and they make their skin still darker by a deep purple dye; they also daub their faces with red, black, and other pigments. There is a mixture of the Papuans and Polynesians, for the people of Erranan and Immer have dialects very similar to the Samoan, and there are intermarriages between the tribes, so that the Polynesians are now nearly as dark-coloured as the Papuan. Various dialects were found, not only in the group, but even on one and the same island. The language spoken at Port Resolution is in some respects peculiar; it has a conjugation of the verb by prefixes, and not only a dual but a triple personal pronoun. The people of Tanna sometimes bury their dead in shallow graves, sometimes tie a stone to them and sink them in the sea. At Anatom, the widow is tied, alive, to the dead body of her husband, and sunk together with it in the sea.

The reading of these papers was succeeded by a great number of inquiries being made of Mr. Heath, on various points in the habits, language, &c., of the people with whom he had mixed. As specimens of the spoken languages of the people of the Navigators Islands, he read over the Lord's Prayer in the two languages they employ, the plebeian and the aristocratic. Prof. OWEN stated that there was every encouragement for this committee to prosecute its labours. Many copious volumes had been written without eliciting so much information as had been gained in this instance by the queries issued by the Committee.

MONDAY.

Mr. Babington having taken the chair, Prof. FORBES exhibited several living animals which he had taken by means of the dredge off the coast of Cork.—Some of these were but rarely taken; amongst them were a white variety of *Cypræa nattica*, *Ophiura texturata*, *Buccinum reticulatum*, *Ophiotoma roscola*, several species of corallines and various crustaceæ, and specimens of the genus Polycera, Eurastia, Trochus, and a hermit crab.

Mr. R. DOWDEN then read an account of a Luminous Appearance on the Common Marigold: *Calendula vulgaris*.—This circumstance was noticed on the 4th of August 1842, at eight, P.M., after a week of very dry warm weather; four persons observed the phenomenon; by shading off the declining daylight, a gold-coloured lambent light appeared to play from petal to petal of the flowers, so as to make a more or less interrupted corona round its disk. It seemed as if this emanation grew less vivid as the light declined; it was not examined in darkness, which omission shall be supplied on a future occasion. It may be here added, in the view to facilitate any other observer who may give attention to this phenomenon, that the double marigold is the best flower to experiment on, as the single flower "goeth to sleep with the sun," and has not the disk exposed for investigation.

Dr. ALLMAN believed that the phenomenon related by Mr. Dowden was not at all due to phosphorescence, but that it was referable to the state of the visual organ. This phenomenon had been thus, he thought, satisfactorily explained by Sir David Brewster. If it were phosphorescence, it would appear brightest at night, and it would be expected to occur in other plants than those of an orange or flame colour.—Mr. BABINGTON stated that the cause of luminosity in plants was ill understood. He had seen, in the south of England, a peculiar bright appearance produced by the presence of the *Schitostega pennata*, a little moss, which inhabited caverns and dark places.—A Member present stated that Prof. Lloyd had examined the moss referred to by Mr. Babington, and had found that the peculiar luminous appearance of that moss arose from the presence of small crystals in its structure, which reflected the smallest portion of the rays of light.

Dr. ALLMAN then exhibited to the Section, specimens of an Annelid, which was very common in the bogs of Ireland, and which was the cause of a luminous appearance.—It was closely allied to the earthworm: when irritated, it gave out a phosphorescent light, which was also much increased when the animal was exposed to the vapour of heated alcohol. The light was of a green colour. Mr. B. Clarke had found these annelids in the bogs of Connaught, and Dr. Allman had also found them in the N.W. of Ireland.

The next paper read was a list of the Insects found in the county of Cork, by W. Clear, Esq.—When it became known that the British Association was about to visit Cork, it was proposed that lists of the Fauna and Flora of the county of Cork should be made out, as far as circumstances would permit, and the preparation of the list of insects devolved on Mr. Clear, as the only person who was known to have paid any attention to the entomology of that district. The list is so extremely imperfect, that the author desires it to be regarded only as a commencement. In it two orders, the Diptera and Hemiptera, have been altogether omitted, and several families, particularly those of minute size, have been scarcely noticed. The absence of a list of the dipterous insects is, however, the less to be regretted, as the insects of this order inhabiting the northern portion of Ireland have been already elaborated by A. H. Haliday, Esq. Mr. Clear's list consisted principally of Coleoptera and Lepidoptera, and comprised in all about 650 species.

Mr. PATTERSON remarked that there were many insects in the north of Ireland that had not as yet been found in the south, and *vice versâ*.

Dr. POWER then read a Catalogue of the Plants found in the neighbourhood of Cork.—Amongst rare plants found near Cork, were *Medicago maculata* and *denticulata*, and *Hypericum calycinum*. Plants, which were not uncommon in other districts and rare here,

Digitized by Google

were also enumerated. The list contained 1425 plants, of which 624 were Cryptogamic.—Dr. Scott stated that he had found *Tragopogon parvifolius* apparently wild in the neighbourhood, and a long way from any spot where salsify was cultivated. He explained the nature of the flowering of *Ruppia maritima*, about which authors had made mistakes. When the anthers are nearly matured, the flowers rise to the surface of the water. They remain so for a little time, when the straight stem begins to assume a spiral form, and the consequence is the drawing down of the flower under the water.—The Rev. W. Hincks thought the *Hypericum calycinum* was an introduced plant. *Iris tuberosa* had been admitted into the catalogue of plants by Mr. Drummond, but this was evidently an introduced plant. The *Cryptogamic* plants of Ireland had been carefully investigated. They were much indebted to Miss Hutchins and Mr. Harvey for their knowledge of the Algæ.

Mr. Thompson, the President, then exhibited to the Section a number of specimens of phanerogamous and cryptogamous plants, accompanied with a catalogue of the plants, which had been collected by Dennis Murray, a working gardener, near Cork. Dennis Murray had, by his labours, added three new species of plants to the Flora of Ireland, and twenty-two new species to that of Cork.

Mr. Thompson, on behalf of Mr. Hyndman, of Belfast, exhibited to the Section a specimen of that singular annelid, which forms for itself a quill-like case, the *Nereis tubicola* of Müller, described and figured in the 'Zoologia Danica.' The present is the first announcement of it as a British species. Three or four specimens were dredged from a depth of forty fathoms, off Sana Island, on the western coast of Scotland, by Mr. Hyndman, in July, 1842.—Mr. Thompson also read a description, drawn up by Mr. Hyndman, of a species of hydrostatic Acalepha, taken in Belfast Bay, in August, 1841. It is the first record of any species of the family Physsophorida occurring in the British seas. The species being considered new, has been named by Mr. Hyndman *Apolemia Gettiana*.

Mr. Peach stated that he had found *Nereis tubicola* on the coast of Cornwall.—Mr. Patterson was glad of the last announcement of Mr. Thompson, as it indicated attention to the family of the Acalephæ, which, he was convinced, were very abundant on our coasts, but which had yet received but little attention.

Mr. Thompson exhibited specimens of the Alpine Hare (*Lepus variabilis*), from the Highlands of Scotland, and of the Hare of Ireland (*Lepus hibernicus*), for the purpose of showing that the species are identical. Of this fact he, judging from external characters, satisfied himself last autumn, when in the Highlands of Scotland, and subsequently proved it by a comparison of the anatomical characters of the two supposed species.

'On the Microscopic Structure of Shells,' by Dr. Carpenter.—The author stated that all the solid calcareous shells of molluscous animals possessed organic structure, in the same manner as the teeth of the higher orders of animals; amongst recent shells this structure is characteristic of various natural groups, and will, therefore, probably afford valuable assistance in the determination of fossil genera and species. The principal varieties of structure were described as consisting of modifications of two simple forms, the Cellular and the Membranous. Of the first of these, the Pinna affords a good example: it consists of prismatic cells, like the cellular tissue of vegetables, filled with carbonate of lime; and if placed in acid, the lime will be removed, and the membrane alone remain, still preserving its cellular structure. In old specimens of the Pinna the animal matter is sometimes destroyed, leaving only the calcareous part of the shell, composed of minute spiculæ of carbonate of lime, which crumble under the finger. Cellular structure is found in all shells belonging to the order Margaritaceæ. With these the Pinna should be placed, since the Mytilaceæ, with which it has been hitherto classed, possess a different structure. Deshayes, in the new edition of Lamarck, upon a comparison of the characters of the genus Pinna, considers it more nearly allied to Avicula than Mytilus. In the fossil genus Inoceramus, traces of the cellular membrane may be discovered by dissolving the shell in weak acid. The anomalous genus Pandora also exhibits its cellular structure in its thick outer layers, the inner layers being nacreous. Dr. Carpenter proposes to place this genus with the Margaritaceæ. The second class of shells described by the author includes those possessing the Membranous Structure. In these the calcareous matter is deposited in laminæ, separated by excessively thin membrane, which forms, in fact, a secreting surface. This membrane does not lie flat, but is usually extremely corrugated and folded, and these folds being repeated in a regular manner, give rise to the nacreous lustre of the shells. Fragments of the Haliotis, after being laid in acid for a week, are still nacreous. A similar structure is also found in the Cowry and other porcellaneous shells, which are composed of three layers, the direction of the folds being different in each layer, as seen in the fracture of the shell. Another peculiarity in the internal structure of some shells consists of *minute tubes*, ramifying copiously over the different layers of membrane, and sending branches into the adjoining laminæ. Both the membranous and tubular structure are found in the *Avicula cygnipes* of the lias, showing that it belongs to the natural order Pectinidæ, and not to the Margaritaceæ. Mr. Phillips was aware, at the time he published this species, that it was nearly allied to the genus Lima and other Pectinidæ. The structure of the Brachiopoda is peculiarly plicated; and in the true Terebratulæ all the laminations are perforated by minute holes, going quite through the shell. In a transverse section these perforations are seen to enlarge as they approach the inner surface, forming funnel-shaped openings, lined by a membranous prolongation of the mantle, which is closely adherent to the inner surface of the shell. In one recent species, the *Terebratula psittacea*, the perforations are wanting; but in this species the structure of the hinge is also different, bringing it near a particular division of the fossil Brachiopoda (Atrypa, Dolman). Most of the fossil Terebratulæ that are *deeply plicated* also want the perforations, and these probably constitute a separate group. In concluding, Dr. Carpenter pointed out some of the peculiarities in the structure of the Echinodermata, which have been noticed by Agassiz in his Monograph. The calcareous plates of an Echinus consist of numerous thin laminæ, connected by little pillars; and as the laminæ are punctured all over, whichever way a section is taken it exhibits a minute net-work. This structure, which prevails in the solid parts of all the Echinodermata, explains the facility with which they absorb fluids. Dr. Carpenter also exhibited diagrams of several beautiful forms of structure in the spines of different species of Cidaris, and in the plates, forming the column of several fossil and recent Pentacrinites, showing that a different arrangement of the internal particles obtained in every species. This structure is well preserved in the fossil species, although they possess a regular crystalline cleavage.

Dr. Allman referred to some points of analogy between the microscopic structure of the shells of the higher molluscs and those of the Ascidæ.—Dr. Lankester compared the structure of the cells in molluscs with those of some plants.

Dr. Harvey furnished a catalogue of the vertebrata of the county of Cork as compared with those of Ireland generally, and Great Britain; by which it would appear, that of 630 vertebrated animals, there are 445 found in Ireland, and of these 285 in the county of Cork. There are of—

	British.	Irish.	Cork.
Mammalia.....	67	28	23
Aves	312	253	161
Reptilia.....	15	7	2
Pisces	236	157	99

Turdus Whitei and *Naucrates ductor*, included in this catalogue, had not been observed before in Ireland. *Glareola pratincola* is noticed as having once been shot in the county of Cork, but the specimen was not preserved.

Dr. Lankester then read the following extract of a letter from Mr. Denny, of Leeds:—"During the recent meeting of the Provincial Medical Association, in Leeds, a medical friend of mine informed me that a pair of grey parrots had hatched and reared a young bird in his village. This struck me as something novel; at least, so far as rearing the young parrot was concerned, as I was previously aware that parrots will lay eggs in this country, but I have never heard of an instance of hatching. I therefore put down several queries for my friend to get me answers to on his return, which I now forward to you, thinking, if the occurrence is really *new*, it might interest some of the members of the British Association, at Cork:—'The two old birds were purchased in the market at Sierra Leone, in 1840, when about six months old, and brought to England in the same cage; but were then separated until February, 1842, the male being left at Hull and the female brought to Riccal. She first commenced laying in July, 1842, and laid three eggs, which were taken from her as she laid them. She began to lay this year about the 10th of June, and laid two eggs, which she sat on exactly four weeks, and brought off one bird only, which was hatched on Sunday, July 16. They are fed upon boiled flour pudding, which the old birds masticate and feed the young bird with. The old lady, the owner, also frequently chews a little pudding and allows the young bird to take it from her mouth. Both birds sat upon the eggs in turn, and the male frequently pushed the female from the eggs for the purpose. The young bird was blind about sixteen days, and quite bare of feathers or down. It can now (August 5) see, and is beginning to be downy, and is growing very fast, and appears a very strong bird.'" Dr. Lankester also exhibited from Mr. Denny, a specimen of a Carabus, completely covered with parasites, which he supposed to be *Europoda vegetans*.

SATURDAY.

Section G.—MECHANICAL SCIENCE.

Mr. Dircks read a paper 'On the Prevention of Smoke by Mr. Williams's Furnace,' the main principle of which consists in admitting atmospheric air at the ordinary temperature behind the bridge of the chimney, and thus supplying oxygen for the combustion of the heated gases. The furnace, and the principle of its action, were fully explained by Mr. Williams himself at the preceding meeting of the Association. The discussion which ensued did not elicit any new facts or opinions.

Mr. Chanter next described his Furnace for Economizing Fuel, which differs from Mr. Williams's in the two essential particulars of heating the air before it is admitted to the fire, and of giving a reciprocating motion to the fire-bars, for the purpose of freeing them from clinkers and ashes. The air is admitted into an air-chamber to be heated, and a "deflective arch," at the bottom of the boiler, turns the generated gases on to the hot fuel, supplied with its requisite portion of oxygen through the clear fire-bars.

MONDAY.

Mr. Scott Russell continued the reading of the 'Report of the Committee on the Form of Ships,' which he had commenced on Saturday.—This Report was voluminous; containing the reductions of a large number of experiments, and about 20,000 observations, made on more than 100 vessels of different forms; accurate drawings of all of which, on a large working scale, were laid on the table. It was the hope of the Committee that this Report might be published, in order to give the public all the benefit which accurate knowledge on this point was likely to convey. He did not, therefore, enter fully into the details of these voluminous results, but would confine himself to a general account of the objects which this Committee had in view, the methods of inquiry which they had adopted, and a few of the more general conclusions to which they had been led. These experiments had now occupied the attention of the Committee during a period of five or six years, and it afforded him peculiar pleasure to be able to present the concluded investigation to this meeting. It was appropriate to this meeting, inasmuch as Cork was an important sea-port, of increasing prosperity, whose interests were involved in everything tending to the improvement of our mercantile navy: it was further appropriate, inasmuch as there existed in the vicinity of Cork a class of the fastest sailing vessels in existence—he meant the fleet of yachts—by the successive trials of which many improvements had been made in the form of vessels; and, indeed, he considered it due to the yacht clubs of this country to say, that much had everywhere been due to their exertions in the improvement of the speed of our ships. He had had the good fortune to find in Cork a gentleman who, in the recesses of his own study, had been carrying on, for many years, valuable scientific investigations on this subject, who had submitted his

Digitized by Google

views to experiment with great success, but had long felt the want of just such a series of researches as he had this day the pleasure of laying on the table. The beautiful models by which the Report was illustrated, had been constructed by Dr. Phipps, to whom he had thus alluded; and in Mr. Beamish, also a native of this place, he had found another scientific and successful investigator in the same field of inquiry. On this account he should enter more fully into this subject, as one in which Cork was especially interested. It had long been the reproach of science, that so little had been done to enable the practical man to proceed with certainty in his attempts to improve the speed of ships. There are some points in which science has done all that can be desired. The immersion of a ship, her trim, her centre of buoyancy, her stability, can all be determined, with accuracy, beforehand, and the scientific naval constructor can proceed with certainty upon fixed principles. It is otherwise with the speed and resistance of a ship. In nothing does calculation more completely fail them than in the attempt to determine beforehand the speed of a ship constructed on given lines, or to show how a form may be so altered as to render it faster than before. To calculate the resistance opposed by the water to the passage of a ship through it, and to find that form which, at a given velocity, will pass through the water with least resistance, and, of course, with the smallest expenditure of power—such was the problem hitherto the least solved, and always one of the most important, which these experiments were intended to investigate. There were also two phases in which this problem presented itself, the Scientific and the Practical view of the subject. There were, therefore, two classes of experiments—one designed to advance our knowledge of the laws of hydrodynamics which govern the phenomena of resistance of fluids, and the other, the experiments serving as a basis to the operations of the practical construction of ships—the *Experimenta lucifera* and the *Experimenta fructifera* of Lord Bacon. To the latter class, he would confine the remarks of to-day, as belonging more especially to Section G, the former having been discussed in Section A. Many experiments had formerly been made on this subject, but we had, at that time, so imperfect a system of hydrodynamics, that the conclusions drawn from them could not be relied on with confidence by the practical man. The Academy of Sciences had made a series of such experiments at a large expense defrayed by the French government. Colonel Beaufoy, in our own country, had made an important series of such experiments, at an expense of 30,000*l.*, but these were of comparatively little value, for the same reason, viz., that the forms did not comprehend such forms as were actually required for the purposes of naval construction, and because the state of science was not such as to enable us, from the resistance of one form, to deduce with certainty that of another. For the purpose of giving practical value to the present series, experiments had been made on many different scales of magnitude, some in narrow channels, others in large canals, and finally on the open sea. Some were made on models 3 feet in length, others of 10 feet, some on vessels 25 feet long, 75 feet long, and some on vessels 200 feet long, and nearly 2000 tons capacity. Thus it was trusted that the scale of the experiments was such as to give confidence in the results. Next, as regards the forms of vessels made the subject of experiment, these were similar to those required for the practical purposes of construction. One class consisted of such forms as were required for steam navigation. Plans of steam ships of the best construction and others of worse forms, were accurately laid down on the same scale, in the same way, and with the same accuracy of proportion as if they had been for actual service, and along with these were some of new forms. A given form having been found to be a good one, was then varied by lengthening, first in one manner then in another, to discover the best mode of improving a given good form. In sailing vessels, some of the celebrated Chapman's best forms were taken, and treated in a similar manner, and along with them were compared the common forms of merchantmen and other ships. The class of fast-sailing yachts and cutters was treated in the same way, the object always being the determination in given circumstances of the method of giving such a form to a ship as shall enable her to pass through the water with the least resistance, the greatest velocity, and of course the smallest expenditure of force, power, and money. The methods of drawing these vessels through the water, varied with the scale on which the experiments were made. Those on the smallest scale were drawn by a weight arranged in such a manner as to supply a uniform force through any given distance.—and on the largest scale, the experiments were made on the sea by means of powerful towing vessels. In this way the experiments were made on a wide range of magnitudes, both as regarded the vessels themselves and the sheet of water on which they were propelled, an element of resistance not always sufficiently taken into account. The resistance was accurately measured by dynamometric apparatus of great accuracy, through which the moving force was communicated to the vessel; the velocity being determined, in certain cases, by a peculiar apparatus designed for this purpose, and in other cases by instruments for measuring and marking time with accuracy. After the observations had been reduced by independent calculators, and not till then, were they made the subject of special examination, with reference to any theory; and thus it was conceived that the greatest amount of authenticity had been secured. The author then proceeded to give to the meeting a number of specimens of the results which the experiments afforded, such as he knew were likely to interest those members of the section who were acquainted with the principles of naval construction. He demonstrated a remarkable law, by which it appears, that each velocity has a corresponding form and dimension peculiar to that velocity; and he showed, in a variety of diagrams, the means of constructing such forms. To show how much influence *form* alone, without any other element or dimension, affects the question of resistance, he adduced the following as one of the most important experiments. Four vessels were taken, having all the same length, the same breadth, the same depth, the same area and form of midship section, and all loaded to the same weight, displacement, and draft of water. The only difference being in the character of the water-lines; No. 1 being of the new form indicated by these experiments as that of least resistance; No. 3 the old form, very nearly the reverse of the first; No. 2 intermediate between them, and No. 4 intermediate between No. 1 and No. 2. The following table shows the result of the comparative trial:—

Speed in miles per hour.	Resistance, in pounds.			
	No. 1.	No. 2.	No. 3.	No. 4.
3 miles.	10	12	12	11.3
4 ..	18	22	23	21
5 ..	28	38	42	35
6 ..	39	61	72	56
7 ..	52	96	129	84

These differences showed how much might be gained, everything else being equal, by the adoption simply of judicious form in the construction of the water-lines of a ship. The vessel No. 1 was constructed on the wave-line; the methods and rules for which he proceeded to explain in diagrams, too numerous for our space to admit. But we hope the speedy publication of the Report itself may soon remedy this omission.

Mr. PERRY observed that the position of the paddle-wheels in steam vessels was an important subject, which required to be determined, especially as different opinions were entertained by practical men whether the paddles should be nearer to the stern or to the head of the vessel.—The MARQUIS OF NORTHAMPTON remarked on the importance of these experiments, which had been carried on by the British Association. The results would possibly produce a change in the naval architecture of every country in the world; and if the British Association had done nothing else than carried out these experiments, and attained those important results, all the efforts they had made would have been amply rewarded.—Mr. J. TAYLOR observed that these experiments had been carried on for five years, and that the late Sir J. Robison, who had been associated with Mr. Russell in their prosecution, had watched over them with great anxiety till within a short period of his death. The Association had expended 850*l.* in making these experiments, and now came the question, what was to be done with the valuable body of information that had been collected? It ought not to lie idle on their shelves, but ought to go forth to the public; and the best manner of accomplishing that would be a subject of consideration for the Council.—Mr. RUSSELL said, that with regard to the position of paddles, the subject had been already taken up by the government, and some practical results might shortly be expected. In conducting the experiments for the British Association, Sir J. Robison and himself having satisfied themselves as to the correctness of their system, they had endeavoured to get it introduced without exciting opposition. The experiments were made in a ship-building country, and ship-builders every now and then borrowed the forms of the boats that had been found to move the fastest through the water, and thus they had been gradually introduced. The *Flambeau*, which was built on the Clyde in 1839, on one of the experimental lines, beat a vessel of greater length, though having but 75 horse-power against 120. In smooth shallow water the vessel on the old construction was a match for the *Flambeau*, but in a deep and heavy sea the experimental vessel beat the other by two miles an hour. There had been since constructed in that part of the country a whole class of vessels built of that form. The *Great Britain* had the wave water-line; and the *Vanguard*, which made her passage last week from Dublin to Cork in two hours less time than had ever been previously accomplished, was constructed by the same builder who had made the models for the British Association experiments.

Mr. PERRY mentioned that he had received a letter from Dublin, announcing the complete success attending the opening of the Atmospheric Railway on the branch of the Kingstown and Dublin line. The length of the atmospheric rail was one mile and three quarters; and the average gradient 1 in 100. After forty strokes of the stationary engine the vacuum gauge stood at 17 inches; after 100 strokes it was at $21\frac{1}{10}$; and it was ultimately raised to 22. The carriages were filled with passengers, and they ascended the line at a speed of twenty-eight miles an hour. When the machinery had got into proper working order, it was expected that a speed of at least fifty miles an hour would be attained.

Prof. MOSELEY's Report of Experiments on Steam Engines, with Morin's Instrument for Measuring Velocities, was read by Mr. J. Taylor.—The experiments have not been completed, and the present communication was rather to report progress to the meeting, than to state results. The object had been to ascertain, by actual experiment, the velocity of the piston of a single-acting Cornish pumping-engine at all points of its stroke. There had not been sufficient time since procuring Morin's instrument to obtain the requisite data, and to work out the calculations necessary for comparing the results of experiment with those of theory, and by this means to elicit the useful information which it is hoped this comparison will offer to practical science. Morin's velocity-measuring machine was received from Paris five months ago, and by it spaces described in the 20,000th part of a second may be easily discerned. It describes a curve somewhat resembling the epicycloid, and from this curve the velocities are ascertained. The principle of the indicator, by which the experiments were made, is this: a circular disc of cardboard is made to revolve on a fixed axis, and a revolving pencil, connected with the piston, describes the indicating curves. The disc which was sent as a specimen indicated the result of experiments made at the Cornish engine at Old Ford. The results were, that the piston of the engine at Old Ford, on the day of experiment, acquired its maximum velocity of ten feet a second at four feet of stroke, and from that point the velocity gradually diminished, until the piston was brought to rest.

Mr. HAWKINS described Perkins's Marine Propeller, for the purpose of keeping that plan of propulsion before the public, as he conceived that it had not yet had a fair trial. Mr. Perkins's plan is to have two propellers, shaped like windmill vanes, fixed at the stern of the vessel on the same shaft, though moving in opposite directions. Each of these paddles is six feet long, consequently their action is more powerful than that of the Archimedean screw, and the revolutions may be proportionally slow. He conceived that this propeller would be well adapted to the *Great Britain* steam vessel, as the screw pro-

Digitized by Google

peller at present attached would not, he thought, be sufficient to propel so large a vessel.

Mr. BEVAN exhibited a model of a complicated kind of Paddle Wheel, intended to be so contrived that the floats should enter the water and come out of it perpendicularly. It was proposed to effect this by having the floats moveable and weighted, so as to keep them perpendicular by their own gravity.

FAMILY ENDOWMENT SOCIETY, LIFE ASSURANCE and ANNUITY OFFICE, 12, Chatham-place, Blackfriars, London.

Directors.

William Butterworth Bayley, Esq. *Chairman.*
John Fuller, Esq. *Deputy Chairman.*

Henry Bowden, Esq. | Elliot Macnaghten, Esq.
Robert Bruce Chichester, Esq. | William Prinsep, Esq.
Alexander Colvin, Esq. | Joshua Walker, Esq.
Edward Lee, Esq.

Major Willock, K.L.S.

CAPITAL 500,000*l.*

The objects of Life Assurance may be accomplished at this Office on terms as low as is consistent with security.

Examples of Life Assurance for 100*l.*

Age.	30	40	50	60
Annual Premium..	£. s. d. 2 4 7	£. s. d. 3 0 3	£. s. d. 4 4 9	£. s. d. 6 2 5

Endowments for future and existing children, and Annuities of all kinds are granted by this Society.

The usual commission allowed to Solicitors and others, and 5*l.* per cent. extra on the first premium.

JOHN CAZENOVE, Secretary.

PELICAN LIFE ASSURANCE OFFICES, 70, Lombard-street, and 57, Charing-cross.—Established 1797.

Directors.

Matthias Attwood, Esq. M.P. | Sir W. Heygate, Bart.
W. Stanley Clarke, Esq. F.R.S. | Kirkman D. Hodgson, Esq.
John Coope, Esq. | R. Henshaw Lawrence, Esq.
William Cotton, Esq. F.R.S. | J. Petty Muspratt, Esq.
Sir William Curtis, Bart. | George Shum Storey, Esq.
William Davis, Esq. | C. Hampden Turner, Esq.
J. A. Gordon, Esq. M.D. F.R.S. | Matthew Whiting, Esq.

The Plan of this Office will be found to comprise all the Solid Advantages of Life Assurance.

Persons have the option of insuring upon the Return or Non-Return Systems; and the Tables, which include Ascending and Descending Scales of Premium, have been framed to suit the convenience of all parties.

The Rates have recently been reduced agreeably to the most approved calculations; they are also verified by the experience of the Office during Forty Years, and are as low as consistent with safety; those adapted to the RETURN SYSTEM entitle its assured to an equitable participation in the surplus premium, according to the plan detailed in the Company's prospectus.

The Assured under both Systems will possess the guarantee of a large PAID-UP Capital, and the further security of a responsible body of Proprietors, without being exposed to the liabilities of partnership.

Policies are purchased on liberal terms when the object of an assurance is effected;—or, loans will be granted thereon to the extent of five-sixths of such purchase-money.

Prospectuses and every information obtained on application at the Offices as above, or to the Agents of the Company appointed in every City and principal Town in the Kingdom.

R. TUCKER, Secretary.

FREEMASONS' and GENERAL LIFE ASSURANCE COMPANY, 11, Waterloo-place, Pall Mall, London.

Business transacted in all the branches and for all objects of LIFE ASSURANCE, ENDOWMENTS and ANNUITIES, and to secure CONTINGENT REVERSIONS, &c. Loans granted. Information and Prospectuses furnished by

JOSEPH BERRIDGE, Secretary.

NATIONAL LOAN FUND LIFE ASSURANCE, ANNUITY, and DEFERRED ANNUITY SOCIETY, 26, Cornhill, London.—Capital, 500,000*l.*—Empowered by Parliament.

Directors—T. LAMIE MURRAY, Esq. *Chairman.*

John Elliotson, M.D. F.R.S. | George Lungley, Esq.
John Griffith Frith, Esq. | John Rawson, Esq.
H. Gordon, Esq. | Clement Tabor, Esq.

Joseph Thompson, Esq.

Auditors—Prof. Wheatstone, F.R.S.; Prof. Graves, A.M. F.R.S.
Actuary—W. S. B. Woolhouse, Esq. F.R.A.S.

The superior advantages to those Assured with this Society will be best understood by a comparison of its principles and a reference to the last Annual Bonus declared on Policies of five years' standing, viz.:

Entry	Policy No.	Age	Sum	Annual Premium.	Bonus added.	Cash Bonus.	Premium reduced.
			£	£ s. d.	£ s. d.	£ s. d.	£ s. d.
1837	39	59	1000	67 8 4	132 14 6	58 19 9	8 19 4
1838	114	56	3000	175 15 0	296 9 7	123 0 6	16 9 7

Policies now entered upon entitled to participation in next Annual Division. Two-thirds of all premiums paid can be borrowed by the assured without loss of Policy.

F. FERGUSON CAMROUX, Secretary.

BRITANNIA LIFE ASSURANCE COMPANY, 1, Princes-street, Bank, London.

This Institution is empowered by *Special Act of Parliament*, (4 Vict. cap. 9), and is so constituted as to afford the benefits of Life Assurance in their fullest extent to Policy-Holders, and to present greater facilities and accommodation than are usually offered by other Companies. The decided superiority of its plan, and its claim to public preference and support, have been proved incontestibly, by its extraordinary and unprecedented success.

Assurances may either be effected by Parties on their own Lives, or by Parties interested therein on the Lives of others.

The effect of an Assurance on a person's own life is to create at once a property in reversion, which can by no other means be realized. Take, for instance, the case of a person at the age of thirty, who by the payment of 5*l.* 3*s.* 4*d.* to the Britannia Life Assurance Company, can become at once possessed of a bequeathable property, amounting to 1000*l.*, subject only to the condition of his continuing the same payment quarterly during the remainder of his life,—a condition which may be fulfilled by the mere saving of EIGHT SHILLINGS weekly in his expenditure. Thus, by the exertion of a very slight degree of economy —such, indeed, as can scarcely be felt as an inconvenience, he may at once realize a capital of 1000*l.*, which he can bequeath or dispose of in any way he may think proper.

Detailed Prospectuses, and every requisite information as to the mode of effecting Assurances, may be obtained at the Office.

PETER MORRISON, Resident Director.

A Board of Directors attend daily at 2 o'clock, for the dispatch of business.

NORTH BRITISH INSURANCE COMPANY, 4, New Bank-buildings, and 10, Pall Mall East.

His Grace the Duke of Sutherland, *President.*
Sir Peter Laurie, Alderman, *Chairman of the London Board.*
Francis Warden, Esq. (Director H.E.I.C.) *Vice-Chairman.*
John Webster, M.D. 24, Brook-street, *Physician.*

LIFE DEPARTMENT.—This Institution is incorporated by Royal Charter, and is so constituted as to afford the benefits of Life Assurance in their fullest extent to Policy-holders, combined with perfect security in a fully subscribed Capital of One Million, besides an Accumulated Premium Fund of Three Hundred and Fifty-five Thousand, and an Annual Revenue, from Life Premiums alone, of Eighty-two Thousand Pounds.

The last Bonus declared averaged 37 per cent. on the premiums paid. The next appropriation of profits will be made in December, 1844; and persons who now insure will participate therein according to the number of annual premiums paid in the interval.

FIRE DEPARTMENT.—Insurances against Loss by Fire may be effected at the Company's Western Branch Office, 10, Pall Mall East, on Private Houses, Country Mansions, Furniture in the same, and Farm Steadings, at the lowest rates of premium corresponding to the risk.

Prospectuses, containing Tables of Rates, and a full List of the Directors, &c. who are all responsible *Partners*, may be obtained on application to Messrs. B. and M. Boyd, Resident Members of the Board, 4, New Bank-buildings; or to the Actuary, Mr. John King, 10, Pall Mall East.

JOHN KING, Actuary.

SCOTTISH (WIDOWS' FUND) LIFE ASSURANCE. Founded A.D. 1815, upon the principle of Mutual Contribution. Constituted by Act of Parliament. Capital accumulated and invested upwards of ONE MILLION THREE HUNDRED THOUSAND POUNDS. Annual Revenue upwards of TWO HUNDRED THOUSAND POUNDS. At 31st December, 1838, the Society's third periodical Investigation, the BONUS ADDITIONS then declared amounted to TWO per CENT. per ANNUM, not only on the original sum assured, but likewise on the Bonus Additions previously declared.

The Fourth Periodical Investigation takes place at 31*st December*, 1845.

Copies of the lately published Prospectus may be had on application, from which intending Assurers may satisfy themselves, that independently of this Society's large Accumulated Fund and Annual Revenue, and other advantages necessarily arising from its long, steady, and extensive business, the Principles on which it is Founded and Conducted are of the most *Equitable* character, and such as hold out the greatest inducements to parties now wishing to become connected with it.

Forms of Proposals, and every necessary information, may be obtained at the Head Office, Edinburgh, or at any of the Society's Agencies. JOHN MACKENZIE, Manager.

LONDON OFFICE, 7, Pall Mall,
HUGH M'KEAN, Agent.

TO ANTIQUARIES.

ANCIENT SEPULCHRAL BRASSES.—J. LIMBIRD, Stationer, 143, Strand, respectfully acquaints Gentlemen who are forming collections of Rubbings from those interesting memorials of the Middle Ages, that he has a Paper admirably adapted for the purpose, 55 inches wide, and of any length that can possibly be required, price 6*d.* a yard. Large and small Rubbing Balls are kept for sale.—Every article in Stationery, of the best quality and lowest price, at Limbird's, 143, Strand, facing Catherine-street.

OLD GILDING, LACKER, and BRONZE, however dirty, faded, or tarnished, rendered equal to new by UPTON'S PARISIAN DETERGENTS. The effect is sudden, astonishing, and lasting; trouble merely sponging the surface, and the expense only a few pence for the largest gilt frame, and the merest trifle for lackered articles. Fly spots are at once removed from gilding; no necessity, therefore, to cover from the fly. Gold detergent, 2*s.* 6*d.* per bottle; lacker and bronze, 1*s.* 6*d.*; lamp, 1*s.* 4*d.* All are innoxious and inoffensive. Sold by Upton & Co., Lamp-manufacturers, 33, George-street, Hanover-square, and 65, Basinghall-street, City. Established nearly 40 years. A trial allowed free of all charge. Trade supplied.

MOULD CANDLES to BURN WITHOUT SNUFFING.—KEMPTON'S PATENT.—These candles do not require snuffing; they burn longer and are cheaper than any other candle; the flame is steady and brilliant. No metallic or deleterious matter is used in the manufacture. Price 8*d.* per lb. Sold by G. E. Parish, agent for exportation, 21½, Bread-street, City, and by Slodden & Stocking, 42, High-street, Marylebone; W. Gethem, Broadley-terrace, Blandford-square; W. Evans, Italian warehouse, Greenwich; John Hawkins, grocer, High-street, Whitechapel; George Hawley, grocer, Pitfield-street, Hoxton; S. Game, Fish-street-hill; J. Pain, grocer, Bethnal-green-road; G. H. Hudson, 229, Blackfriars-road; C. H. Nicholas, 19, Bolingbroke-row, Walworth; and at the manufactory, Old Bargehouse, Christchurch, Surrey.

WATCHES by WEBSTER & SON, Chronometer Makers to the Lords of the Admiralty (Established 138 years), 3, BIRCHIN-LANE. The largest assortment of fine Second-hand Watches of any house in London, by the most eminent makers—many nearly equal to new, and at little above half their original cost, all of which W. & Son warrant. They consist of fine Repeaters, Duplex, Lever, and Horizontal Escapements, all of superior manufacture. New Watches of the most elegant patterns upon the principle of their Chronometers, to which the Government awarded the prizes three years in succession, with compensation balances to counteract the variations of temperature. Also a large assortment of Lever and elegant Horizontal Watches, for Ladies and Gentlemen, at considerably reduced prices. Old Watches taken in exchange. The most experienced workmen are employed on the premises in the repairing department.

Webster & Son, 3, Birchin-lane, Cornhill.

THE OMBROSOME, or PATENT PORTABLE SHOWER BATH, especially adapted for travelling and exportation. By this Bath an inexhaustible shower is produced from a few quarts of water: the height of the shower may be increased or lessened to suit adults or children, and occupying so little room, is peculiarly suited for bed-rooms and dressing-rooms; it is also an excellent Douche Bath. Being little larger than a writing-desk when packed, it will be a great desideratum for exportation to India and other hot climates. To Military Men and others of a migratory life, also to Students of the Universities, Inns of Court, &c. (where rooms are low and water scarce), the present invention cannot fail to be most acceptable. It is made entirely of brass, and is at once simple and elegant.—May be seen at the Royal Polytechnic Institution; and be had, with Prospectuses, at the Bazaar, Panklibanon Iron Works, 58, Baker-street; Mr. J. L. Benham, 19, Wigmore-street; Mr. C. Bray, 16, Cranbourne-street; Mr. J. Deacon, 4, Moorgate-street; Mr. J. Evans, London Bridge, and Ludgate-hill; Messrs. Fallows & Adcock, 4, Halkin-street West; Messrs. Glenton & Chapman, 147, New Bond-street; and may shortly be had of all the leading Ironmongers throughout England.

Price 4*l.* 10*s.* and 5*l.* 5*s.*

BUTTER MADE IN TEN MINUTES, by the NEWLY-INVENTED CHURN, registered according to Act of Parliament.

ATTWOOD, WIMBLE & WARNER, Manufacturers, LEWES, Sussex.

This CHURN being made entirely of Block Tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which insures the butter coming in ten or twelve minutes. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use.

Sizes,	No. 1,	2,	and 3,
Churn from	7 to 8 lbs.	13 to 15 lbs.	26 to 28 lbs.
Price, carriage paid to London,	25*s.*	35*s.*	42*s.*

Metal Pans for Churns to stand in, 4*s.* 6*d.*, 6*s.*, and 7*s.* Larger sizes made to order. N.B. Thermometers and Butter Prints supplied. May be obtained through any respectable Ironmonger in Town or Country, and from the Manufacturer, Lewes.

To be seen in London, at Wright's Range Warehouse, No. 3, Arthur-street, near the Monument; W. Baily & Son, Furnishing Ironmongers, 71, Gracechurch-street; Livermore & Son, Ironmongers, No. 30, Oxford-street; Benham, 19, Wigmore-street, Cavendish-square. Export Agents, Barnes & Co., 109, Fenchurch-street.

NORTON'S CAMOMILE PILLS are confidently recommended as a simple, but certain remedy, to all who suffer from Indigestion, Sick Headach, Bilious and Liver Complaints; they act as a powerful tonic and gentle aperient, imparting strength to the stomach, and composure to the nervous system. Sold in bottles, at 1*s.* 1½*d.* or 2*s.* 9*d.* each, by A. Willoughby & Co., late B. G. Windus, 61, Bishopsgate Without; and nearly all Medicine Venders.

COMPLETION OF

JARDINE'S NATURALIST'S LIBRARY.

The concluding Volumes of the above Series are now ready, price 6*s.* each, viz.,

VOL. XXXIX. BRITISH FISHES, the Second and Concluding Volume, by DR. HAMILTON. With 36 coloured Plates, and Portrait and Memoir of Baron Humboldt.

VOL. XL. BRITISH BIRDS, the Fourth and Concluding Volume, by SIR W. JARDINE, Bart. With 33 coloured Plates, and Portrait and Memoir of Wilson, the American Ornithologist.

Any of the former Volumes may be had separately.

An entire set of uniform Title-pages is printed in Vol. XL.

S. HIGHLEY, 32, Fleet-street, London; W. H. LIZARS, Edinburgh; CURRY & Co. Dublin.

MRS. GORE'S NEW NOVEL.

Now ready, at all the Libraries, in 3 vols.

THE BANKER'S WIFE;

OR, COURT AND CITY.

By MRS. GORE, Authoress of 'Mothers and Daughters,' 'Mrs. Armytage,' &c.

"We do not hesitate to pronounce the work before us as masterly. The cleverness of the opening portion of the story becomes absolute genius in the concluding scenes."—*Court Journal.*

HENRY COLBURN, Publisher, 13, Great Marlborough-street.

HINTS TO SECRETARIES OF READING SOCIETIES.

It has been asserted by Malthus and his disciples that the production of human food increases only in an arithmetical progression, while the race of consumers goes on doubling in a geometrical ratio. The same, however, cannot be truly predicated of food for the mind, the number of publications intended to amuse or instruct having increased within the last few years beyond all reasonable calculation.

The consequence of this restless and increasing energy in what may not unaptly be called *the book manufacturing districts*, is that in the bygone year no fewer than seventeen hundred new works and new editions have been published in London alone,—giving us a rate of nearly five books *per diem*, Sundays included. Now, if we take these at the most moderate average of price, a single copy of the aggregate would fall little short of eight hundred pounds, a sum scarcely within the reach of any purchaser. It is true that no one reader would want, or could possibly get through, so many volumes in the twelvemonth; but then people's tastes are so various, that a library, to be generally useful, must embrace almost everything. But, beyond this, there is another evil, which no prudence can get over, and which alone would prevent any reasonable individual from attempting to form a collection. Such and so great is the advance of science in the present age, that a book in a twelve-month may become obsolete, halting lamely behind the rapid march of intellect: the tree of knowledge is constantly,—nay, almost hourly,—pushing forth fresh leaves and fresh fruit, which must be gathered on the instant. Who, for instance, would in these days waste a single hour on Goldsmith's History of Rome, when the recent discoveries of Niebuhr have sufficiently proved that the whole of it, from title-page to colophon, is no better than a bundle of monstrous lies,—in fact, a Roman "Baron Munchausen"? Nor is the matter at all mended when we come to works of fiction: the majority of them are much too ephemeral in their nature to make them desirable objects of purchase. Until the last few years the perusal of substantial works could not be had except by buying, or in some public institution, while circulating libraries were the repositories of novels, and nothing but novels. This defect forced those who wished for the perusal of something more than the mere ephemeral literature of the day to form themselves into reading societies. But this necessity no longer exists—many of the leading Librarians have deviated from the old beaten track, and launched out into the realms of the useful. In Churton's Library, Holles-street, Cavendish-square, is such a voluminous collection of our Standard Authors, as well as such an abundant supply of all the best Modern Works on Art, Science, and Literature, that Book-Clubs will find it infinitely better and cheaper to subscribe there than to buy on their own account. But on these occasions there is nothing like the plain unanswerable statement of figures. We will therefore suppose that a country Book Society had a fund of Twelve Guineas per annum, and after deducting two guineas for expenses of carriage, &c., subscribed ten guineas—for this sum they would be entitled to thirty volumes at one time, of which twenty would be of the newest; these they might exchange as often as they liked, but for the sake of our illustration we will say ten times during the year; thus they would have during that time ..... 300 vols.

On the other hand, if they purchased their works, we will suppose that by the sale of them, at the end of the year, the twelve guineas is increased to nine-teen guineas,—for this sum, calculating the average price of a volume at 8*s.* 6*d.*, the Club would have in their possession during the year..... 47 vols.

Majority in favour of a subscription 253

TERMS OF SUBSCRIPTION, FOR READING SOCIETIES, TO

CHURTON'S BRITISH AND FOREIGN LIBRARY,

26, HOLLES STREET, CAVENDISH SQUARE.

Subscribers to Churton's Library have the following peculiar advantages offered them:—

MIDWIFERY..Dr. Ashwell, Dr. Lever, and Dr. Oldham.
PATHOLOGICAL ANATOMY..Mr. T. W. King and Mr. Hilton.
CHEMISTRY..Mr. A. Aikin and Mr. A. Taylor.
BOTANY..Mr. C. Johnson and Dr. G. Bird.
MEDICAL JURISPRUDENCE..Mr. A. Taylor.
NATURAL PHILOSOPHY..Dr. Gull.
MORAL PHILOSOPHY..Rev. F. D. Maurice.
MICROSCOPICAL ANATOMY..Dr. Williams.
CLINICAL LECTURES and INSTRUCTIONS will be given on Medical, Surgical, Ophthalmic, and Obstetric Cases, by the Physicians and Surgeons.
Dr. Gull and Dr. Nevins will assist in their studies those Pupils who are preparing for their Examinations.
Pupils will be permitted to attend the Eye Infirmary and the Obstetric Charity, and will also have the use of the Museums, Anatomical Model Room, Library, Reading Room, and Botanic Garden.
For particulars apply to Mr. Stocker, Apothecary to the Hospital.

STODDART and CONOLLY FUND.—At a PUBLIC MEETING, held at the Crown and Anchor Tavern, in the Strand, on Thursday, the 7th September,
Captain GROVER, Unattached, F.R.S., in the Chair,
the following resolutions were passed unanimously:—

Moved by J. S. Buckingham, Esq., seconded by Colonel Humfrey:

1. That, in the uncertainty which exists respecting the lives of Colonel Stoddart and Captain Conolly, it is desirable to ascertain the real facts of the case.

Moved by James Walker, Esq. F.R.S., President of the Institution of Civil Engineers, seconded by Dr. Burnes, brother of the late Sir Alexander Burnes:

2. That a Committee be formed to communicate with the British Government on this subject, to send out immediately the Rev. Dr. Joseph Wolff to Bokhara, to ascertain the fate of Colonel Stoddart and Captain Conolly, and to take such measures as may be thought necessary.

Moved by Captain W. G. Moorsom, and seconded by Captain Nestor:

3. That the following gentlemen do constitute such Committee, with power to add to their numbers, and that a subscription be now opened to obtain the requisite funds for accomplishing the object proposed:—Captain Downes, R.N., Lieutenant Raper, R.N., J. S. Buckingham, Esq., Colonel Humfrey, Captain Moorsom, Lewis Tonna, Esq., Captain Grover.

(Signed) JOHN GROVER, Chairman.

It was moved by J. S. Buckingham, Esq., and seconded by Captain Moorsom:

That the thanks of the Meeting be given to Captain Grover for the great zeal and humanity with which he has brought the subject before the public, and for the manner he has filled the chair this day.

Subscriptions received by Messrs. Drummond, Charing-cross; Messrs. Hankeys, Fenchurch-street; and the Committee.

JOHN GROVER, Capt. Unattd. Army and Navy Club, President of the Committee.

BRITISH AND FOREIGN INSTITUTE.

President.
THE RIGHT HONOURABLE THE EARL OF DEVON.

Trustees.
Lord Courtenay, M.P. | The Lord Bishop of St. David's
Sir George Larpent, Bart. | Benjamin Bond Cabbell, Esq.

The Second Enrolment, making Five Hundred Members, being now filled up, immediate measures will be taken for opening the Establishment. For this purpose the spacious and handsome Residence of the late Lord Wrottesley, in George-street, Hanover-square, has been taken, and will be furnished for the use of the Literary Department of the Institute, while the adjoining Mansion, formerly the Residence of Lady Cowper, will be also fitted up with all the requisite conveniences for the Club Department of the Institute, under the direction of a skilful and experienced Restaurateur, with a communication between the two buildings. As Candidates for admission are entered in the strict order of priority, early application can alone secure an early registry. Such applications can be made personally, or by letter, to the undersigned, from ten to five o'clock, at the Hanover-square Rooms, where the Committee sit daily, and where Prospectuses and Cards of Admission may be procured. JAMES S. BUCKINGHAM,
September 12, 1843. Managing Director.

EDINBURGH REVIEW, No. CLVIII.—ADVERTISEMENTS for insertion in No. 158 of the *Edinburgh Review*, must be sent to the Publishers' by Monday, the 25th instant; and BILLS on or before Wednesday, the 27th.
39, Paternoster-row, Sept. 16, 1843.

ORIENTAL LANGUAGES, ETC.

MR. HATTERSLEY gives LESSONS in Arabic, Persian, Turkish, Sanscrit, Hindustani, Bengali, Hebrew, Greek, Latin, French, Italian, Spanish, Portuguese, German, Dutch, Swedish, Danish, Icelandic, and Russian; in Theoretical and Practical Mathematics, &c.
3, Charlotte-row, Holloway-road,
Opposite Highbury Gates.

HOWE, LEONARD & CO., AUCTIONEERS AND COMMISSION MERCHANTS, BOSTON, UNITED STATES.—Particular attention given to Sales of New and Old Books, Paintings, Engravings, and Fancy Goods; also any other description of Merchandize. Refer to John Miller, Bookseller, London; Goddard & Hill, Birmingham.

RECONNOITERING TELESCOPES.—These beautiful Instruments, measuring but 3½ inches when closed, possess sufficient power to show clearly Jupiter's moons; price 35s., securely packed and sent through the post for 1s. To be had only of the maker, JOHN DAVIS, Optician, Derby; or at the establishment of his brother, High-street, Shrewsbury.

IMPORTANT EXTENSION of the DESIGNS ACT.—By the Act to amend the Designs Act, which came into operation on the 1st of September, *Designs for Articles of Utility*, as well as *Ornamental Designs*, may be *protected by Registration*, for the whole of the three Kingdoms, for three years, at a small expense. For a copy of the Act see *Mechanics' Magazine*, No. 1017, Sept. 2, price 3d.—For further particulars apply to Messrs. Robertson & Co., Patent and Designs Registration Agents, 166, Fleet-street, London (*Mechanics' Magazine* Office).

OLD AND NEW BOOKS.

PARTIES visiting BIRMINGHAM at the approaching Musical Festival, are respectfully informed that there are now on Sale at 37, NEW STREET, many thousand Volumes of MISCELLANEOUS LITERATURE (many of which are rare and difficult to be procured), offered at much lower prices than such books can be obtained from any house in London.
Messrs. Cornish, Cheap Book Establishment, 37, New-street, Birmingham.

STRAWBERRY HILL.

Just published,
A CATALOGUE of a singularly choice COLLECTION of RARE and VALUABLE BOOKS in the various Departments of Literature: comprising Early English Poetry and Plays—British and Foreign History and Biography—Black Letter and privately printed—Romances, Jest Books, Songs, Ballads, Music, and Treatises on Music—a few highly interesting Manuscripts—many fine Books of Prints, Coins, Gems, &c.—Miniature Paintings, Ancient Carvings, Tapestry, valuable Original Portraits of distinguished Persons; together with some thousands of engraved Portraits, &c. &c., principally from the Collection of Horace Walpole. The whole are in fine condition, and warranted perfect. Many of the books are in elegant ancient and modern bindings; now offered at the prices affixed to each article, by WILLIAM STRONG, Bristol.
Catalogues to be had of the Publisher, 26, Clare-street, Bristol; and of Messrs. Longman & Co. London. Price 2s. 6d.; or by post, 4s., returned to purchasers.

Now ready, gratis, and post free,
HINTS for the FORMATION of READING SOCIETIES.—The plan advocated in this little pamphlet will effect two important objects—that of adding to the supply of the current literature the choice of all the most valuable works in the various languages, and that of extending the choice of new books to the entire productions of the press. It is especially adapted to provincial readers, as by a small annual subscription the perusal of all the New Works as they appear may be obtained.
Saunders & Otley, Publishers, Conduit-street;
Of whom may be had, gratis and post free,
A NEW LIST OF THE REDUNDANT COPIES Of NEW PUBLICATIONS in History, Biography, Memoirs, Travels, Novels, &c., withdrawn from Saunders & Otley's extensive Library, Conduit-street, Hanover-square.

GROWTH OF PLANTS.

HUMPHREYS'S COMPOUND to Promote the Beauty and Preservation of Plants, may be used either in the Drawing-room or in the Conservatory, and, from its condensed, fertilizing power, a few grains dissolved in water at intervals is effective. Applicable to all Greenhouse Plants; to Hyacinths, and other bulbs; and to promote the growth of cuttings and the germination of seeds.—Sold in bottles, 1s. 6d. each, by all the leading Chemists and Seedsmen in Town and Country. Wholesale Agents, DAVY, MACKMURDO & Co. 100, Upper Thames-street, London.

A whole Page	2 10 0
Bills stitched in	2 2 0

Of these 2,500 Copies are required.

A Second Edition of the First Number has just been published.

Edinburgh, Sept. 4, 1843.

OFFICE for PATENTS of INVENTIONS and REGISTRATION of DESIGNS, No. 14, Lincoln's Inn-fields, where all business relating to the Securing and Disposing of BRITISH and FOREIGN PATENTS, Preparation of Specifications, Drawings of Inventions, is expeditiously and economically effected.

Also REGISTRATIONS under the New Consolidated Copyright of Designs Act, 5 & 6 Vict. cap. 100.

A Prospectus, containing much useful information, may be obtained, and references to an Alphabetical List of Patents and Registrations made, on application to Mr. Alexander Prince, 14, Lincoln's Inn-fields.

BRITISH METALLURGICAL ASSOCIATION of ALICANTE.—According to a statement lately printed by the Directors of the above Association at Alicante, it appears that the result of their operations to 30th April, 1843, was—

	Dollars.
373,738 oz. Silver delivered at their works agreeably to contracts entered into, the proceeds	418,037 14 6
16,084 cwt. of Leads, of which 8,084 had been shipped to England, the proceeds, including a profit insured on cargo, per *Ocean Child*, which vessel foundered at sea	81,618 0 26
8,000 cwt. remained for sale or further shipment	
The cost of the Buildings at Alicante	33,430 9 0
The cost of Machinery from England, and erecting seven furnaces	26,696 16 15
The cost of a Smelting Establishment at Garrucha, with five furnaces complete, which now yields from 40,000 to 45,000 ounces of silver monthly, besides lead, at a comparatively small expense, owing to its proximity to the mining district	45,000 0 0
	107,127 5 15
Profits on an average of nine months' work, with actual force at both works, on a capital of only 50,000 dlrs.	54,904 7 16
Deduct extraordinary expenses, which will not occur again, incurred in bringing from England an experienced assayer, and the necessary workmen of every description, including their salaries until the works were ready D. 10,000 0 0	
and interest on monies taken on loan 14,304 19 30	24,304 19 30
	D. 30,699 7 30

Net gain on 30th April, 1843, including every charge from commencement of the enterprise 16 months ago, for a dividend of 61 per cent.

At a General Meeting of Shareholders held on the 21st of May last, in conformity with the rules of the Company, it was resolved that 250 additional shares (or more, if the Directors judged fit) should be issued at 400 dlrs. each: of these a number were at once subscribed for, and by last advices about one-fifth of the new issue had been disposed of. It was originally contemplated by the leading shareholders that the capital of the Company should be composed of 2 000 shares, at 100 dlrs. each; however, it was finally agreed on between them that a trial should be made with only 500; this has been done, and with such very flattering results, that the recommendation of the Directors in favour of a further issue of shares for the purpose of forming a more suitable capital, was unanimously approved of.

N.B. By the 13th article of the Deed of Settlement, and in accordance with the articles of the Spanish Commercial Code, Shareholders are only answerable for the liabilities of this Company to the extent of their respective shares.

Applications for shares (400 dlrs. each—85*l.* sterling) to be made at the office of the Company's London Agents, 26, Bucklersbury, between the hours of 11 and 2. CLAY & GILLMAN,

26, Bucklersbury, Aug. 25, 1843. Agents.

In 1 thick volume 8vo. price 10*s.* 6*d.* cloth lettered,

ANIMAL PHYSIOLOGY, including a General Survey of the Animal Kingdom, with special reference to the Human Body.

By W. B. CARPENTER, M.D.,

Author of 'Principles of General and Comparative Anatomy.'

The present volume forms the third of the CYCLOPÆDIA of NATURAL SCIENCE, the object of which is to produce a series of Treatises, each complete in itself, but connecting the whole range of Natural Science, and elucidating their respective bearings upon each other.

London: W. S. Orr & Co. Amen-corner.

HORTICULTURAL ALMANACK.

The STATIONERS' COMPANY will publish, with their usual Almanacks, early in November, price 1*s.*,

THE GARDENERS' ALMANACK, and CALENDAR and REGISTER of the KITCHEN, FRUIT, FLOWER, and FORCING DEPARTMENTS, for the Year 1844.

By GEORGE W. JOHNSON, Esq.

Fellow of the Agri-Horticultural Society of India; Corresponding Member of the Maryland Horticultural Society; and Author of 'A History of English Gardening,' 'The Kitchen Garden,' &c.

*** This almanack will afford a large supply of matter, interesting not only to the professional, but also to the domestic gardener, as well as to the amateur cultivator of flowers and fruits, and general reader. Besides containing calendarial directions and suggestions for every department during the current year, it will also be a register of all discoveries in gardening which have characterised the previous twelvemonths. The contents will, for the most part, vary every year; and it is recommended that each annual publication be preserved, as an index will be given to bind up with each volume. To Nurserymen, Seedsmen, Implement-makers, and Publishers of works connected with the cultivation of the soil, this Almanack offers a peculiarly desirable organ for Advertisements, as a very large number will at once be circulated through the United Kingdom, and will remain *a permanent and indexed record* for reference in the hands of those most desirable to be made acquainted with their contents, viz., the Landed Gentry, and Cultivators of Gardens generally.

WORKS PRINTED FOR

TAYLOR & WALTON,

28, UPPER GOWER-STREET.

On the 2nd of October will be published, Part I. (on Gas Illumination), price 2*s.* 6*d.* of

APPLIED CHEMISTRY IN MANUFACTURES, ARTS, AND DOMESTIC ECONOMY.

Edited by E. A. PARNELL,

Author of 'Elements of Chemical Analysis.'

With numerous Wood Engravings.

To be continued in Monthly Parts, each 2*s.* 6*d.*

A Prospectus of the Work may be had of the Publishers, or through any Bookseller.

II.

New Work by Professor Liebig.

In the course of this Month, in fcap. 8vo.

FAMILIAR LETTERS ON CHEMISTRY,

AND ITS RELATIONS TO

COMMERCE, PHYSIOLOGY, AND AGRICULTURE.

By JUSTUS LIEBIG, M.D.

Professor of Chemistry in the University of Giessen; Edited by JOHN GARDNER, M.D., Member of the Chemical Society.

III.

New Classical Dictionary.

SECTION I. (Parts I. to III.), price 12*s.* of

A DICTIONARY OF GREEK AND ROMAN BIOGRAPHY AND MYTHOLOGY.

Edited by WILLIAM SMITH, L.L.D.

To be continued in Quarterly Parts, each 4*s.*, and to form two 8vo. vols., illustrated by numerous Engravings on Wood.

The Articles in the Work will be contributed by the following Writers:

Charles T. Arnold, M.A., one of the Masters in Rugby School.
Arthur Hugh Clough, M.A., Fellow of Oriel College, Oxford.
George Edward Lynch Cotton, M.A. Fellow of Trinity College, Cambridge, one of the Masters in Rugby School.
William Fishburn Donkin, M.A., Savilian Professor of Astronomy in the University of Oxford.
Edward Elder, M.A., Head Master of Durham School.
William Alexander Greenhill, M.D., Trinity College, Oxford.
John T. Graves, M.A., Professor of Jurisprudence in University College, London.
Algernon Grenfell, M.A., one of the Masters in Rugby School.
Benjamin Jowett, M.A., Fellow and Tutor of Baliol Coll. Oxford.
Henry George Liddell, M.A., Student of Christ Church.
Charles Peter Mason, B.A.
William Plate, L.L.D.
C. E. Pritchard, B.A., Fellow of Baliol College, Oxford.
William Ramsay, M.A., Professor of Humanity in the University of Glasgow.
Frederic Ritschl, Ph. D., Professor in the University of Bonn.
Leonhard Schmitz, Ph. D., late of the University of Bonn.
Philip Smith, B.A.
William Smith, L.L.D. (Editor).
Arthur P. Stanley, M.A., Fellow and Tutor of University Coll., Oxford.
Adolf Stahr, Ph. D., Professor in the Gymnasium of Oldenburg.
Robert Whiston, M.A., Fellow of Trinity College, Cambridge.

Part IV., price 4s. will be published October 2.

By the same Editor,

IV.

Greek and Roman Antiquities.

1 vol. 8vo. (1,100 pages), with 500 Engravings on Wood, 1*l.* 16*s.* cl.

A DICTIONARY OF GREEK AND ROMAN ANTIQUITIES.

By various Writers. Edited by Dr. W. SMITH.

V.

Æschylus.

In 1 vol. 8vo. 15*s.* cloth,

A LEXICON TO ÆSCHYLUS,

Containing a Critical Explanation of the more difficult Passages in the Seven Tragedies. By the Rev. W. LINWOOD, M.A. Student of Christ Church, Oxford.

VI.

New English Grammar.

This day is published, in 12mo. price 4*s.* 6*d.* cloth,

AN ELEMENTARY ENGLISH GRAMMAR.

For the Use of Schools. By R. G. LATHAM, A.M., Professor of the English Language and Literature in University College, London.

VII.

Niebuhr's Rome, Vol. III.

Now ready, with a copious Index (97 pages) to the 3 vols. Vol. III., price 18*s.* 6*d.* of

NIEBUHR'S HISTORY OF ROME.

Translated by WILLIAM SMITH, L.L.D. and LEONHARD SCHMITZ, Ph. D.

Recently published, the 3rd edition of Vols. I. & II., each 16*s.*

Translated by Bishop THIRLWALL and Archdeacon HARE.

FELIX SUMMERLY'S

RECREATION HAND-BOOK GUIDES,

Corrected for the Season of 1843.

"Recreation is a second creation, when weariness hath almost annihilated one's spirits. It is the breathing of the soul, which otherwise would be stifled with continual business....As for those that will not take lawful pleasure, I am afraid they will take unlawful pleasure, and by lacing themselves too hard grow awry on one side."

FULLER'S HOLY AND PROFANE STATE.

Price 2*s.* 6*d.* in an Ornamental Cover of the 16th Century,

NATIONAL GALLERY,

WITH FIFTY REMINISCENCES OF THE MOST CELEBRATED PICTURES, DRAWN EXPRESSLY FROM THE ORIGINALS, BY MESSRS. JOHN JAMES AND WILLIAM LINNELL.

A few copies of this Edition, with each Engraving on a separate leaf, are printed in umber for colouring, price 10*s.* in a portfolio. To be had of the Publisher, and of Messrs. Paul & Dominic Colnaghi, Pall Mall East.

(Open daily, from Ten to Four, except Friday and Saturday.)

Other Editions, price 6*d.*, 3*d.*, and 1*d.* Also,

Catalogue des Tableaux qui se trouvent dans la GALERIE NATIONALE. Prix 6*d.*

HAMPTON COURT PALACE.

(OPEN DAILY, EXCEPT FRIDAYS.)

Being a Guide to the Architecture, Tapestries, Paintings, Gardens and Grounds of Hampton Court: with numerous Embellishments on Wood, engraved by Ladies; and Plans of the Palace and Grounds from Official Surveys. The Illuminated Cover is taken from a design for a book-cover produced by Hans Holbein for Cardinal Wolsey. Second edition, price 5*s.* in cloth, and Holbein's cover in gold, with Maps and Plans; and 2*s.* 6*d.* not gilt, and with plan only.

"Decidedly the best popular guide to the picturesque beauties of Hampton Court of any extant."—*Spectator.*

FREE PICTURE GALLERIES;

Being a GUIDE to all the PICTURES in the NATIONAL GALLERY, the DULWICH GALLERY, the SOANE MUSEUM, the SOCIETY of ARTS, and the BRITISH MUSEUM. Price 1*s.* 6*d.*

"These Catalogues are more raisonnés and correct than the correspondent official ones; are more portable, and to their limits every way commodious, whilst they cost together much less than several of the latter cost separate."—*Athenæum.*

HOLIDAYS; a Guide to London Sights. 6*d.*

WESTMINSTER ABBEY.

(The Abbey opens at 9 A.M., and closes, in the Summer, at 6 P.M. The Tombs are shown until half-an-hour before, and about an hour after, Divine Service, which commences at 10 A.M. and 3 P.M. Entrance to Poets' Corner, free; to the Nave, alone, 3*d.*; with the Chapels, 6*d.*)

A Guide to the Architecture, Sculptures, Tombs, and Decorations, with 56 Embellishments on Wood, engraved by Ladies, 4 Etchings, a Specimen of Encaustic Tiles in the Chapter House, and an Illumination. Price 7*s.* Cheaper Editions, 3*s.*, 1*s.* 6*d.*

"Its pages are not disfigured by the usual Guide-book sentimentality, rambling on without method, and mixing inaccurate if not false information with indiscriminate and nauseating praise, but it gives a well arranged and correct description, neither too popular nor too pedantic, of the Sacred Edifice."—*Ecclesiologist*, published by the Cambridge Camden Society.

"A volume got up in excellent taste, and written in a right spirit; critical so far as criticism could be allowed, but always suggestive, and testing opinions by reference to principles. As if to perfect the interest of the work, its fifty-six illustrative engravings have all been executed by women; and some amateurs, Lady Calcott and Lady Palgrave amongst others, have gracefully contributed drawings, and thus associated their names with their sister artists."—*Athenæum.*

GUIDE A L'ABBAYE DE WESTMINSTER. Prix 1sh.

TEMPLE CHURCH.

With Eight Illustrations. Printed in three colours, in novel combinations of lithography and type, with Ornamental Cover of the pattern of the Encaustic Tiles. Second Edition. Price 1*s.*

A HAND-BOOK for CANTERBURY; with 35 Illustrations, 3*s.* 6*d.*; cloth extra, 5*s.* 6*d.*

Just published,

DAYS' EXCURSIONS OUT OF LONDON; to ERITH, ROCHESTER, and COBHAM; with a Catalogue of the Pictures at Cobham Hall; Maps and Illustrations, price 2*s.* 6*d.*

LONDON, SATURDAY, SEPTEMBER 16, 1843.

REVIEWS

The Psalmists of Britain.—Records, Biographical and Literary, &c. By John Holland. 2 vols. Groombridge.

"Psalmody, in its literature," says Mr. Holland, "must, at best, be allowed to be sufficiently alien to the modern taste for unnaturally-exciting fiction"; and, therefore, he infers that "but little sympathy can be expected for a subject like this from the great bulk of general readers." Our industrious author appears to us somewhat mistaken. We can only suppose that he has lived so entirely apart from the movements of the time—with Sternhold and Hopkins, the Countess of Pembroke, Myles Coverdale, and his other closet companions,—as to be ignorant that Fiction is now at a discount; whereas Poetry, Painting, Architecture, and Music are becoming objects of popular attention. Psalmody, indeed, in its connexion with the religious movement of the age, has other interests and attractions that legitimately belong to it; since in proportion as one party, with its motett societies, its liturgical hymns, and antiphonies, is doing its utmost to Romanize the forms of our worship, the other grasps its psalm-book—that signal of dissent and recusancy — all the more strongly; and triumphs in proportion as the importance of that volume, whether literary or spiritual, is exalted. Why the Psalter, with its rhythmical tunes and ballad metres, should have been pitched upon by the zealots as an engine of defence and offence against a church accused of ministering to sensual appetites by spiritual excitements,—why the version of Marot, which contributed its device to the picture of Diana of Poictiers, when her unadorned charms were painted to please a voluptuous king by Primaticcio, should have been adopted by the stern reformers of Geneva, —has always seemed to us as fair an example of human inconsistency as the annals of opinion present. But we must leave these speculations, though it was necessary to advert to them by way of indicating the tone in which a work like this may be executed.

Mr. Holland's volumes belong to the Tabernacle rather than the Church. A Keble, had he undertaken the task at all, would have thrown over it a light as different from our author's, as the tints which stream through emblazoned glass upon a cathedral pavement, fretted with epitaphs, are from the clear, broad, but monotonous blaze of noon, which looks in through the window of a meeting-house on its closely-packed pews. Mr. Holland's book, however, is more a curiosity of literature for the general reader, than an aid to the controversialist or devotee. So far from his *variorum* version of the Psalms being the best we have seen, as some might expect, it is one of the least satisfactory. In his anxiety to include every author or amateur who has exercised his talents upon the Psalms of David, he has been led to include many compositions in every respect dry and inferior. It is as a treasury of curious anecdote, containing also many quaint specimens of versification, that the publication before us is to be recommended; and we will proceed to justify this character by such notices and extracts as are likely to be most generally acceptable.

Mr. Holland enumerates, in his introduction, the different forms in which the Psalms have been used,—pointing to the metrical version of St. Jerome's French Psalter, in the library of Corpus Christi College, as the earliest version we English possess. This is as ancient, Dr. Warton supposed, as the reign of Henry the Second or Richard the First. But the Psalter, even in a dead language, was never kindly adopted by the Romish church; a few insulated specimens, such as 'Dixit Dominus,' were employed alternately with such traditional and imaginative hymns as the 'Stabat Mater,' or 'O salutaris.' Nor is it probable that there was any version in our tongue before the days of Sir Thomas Wyatt the elder, who is said to have translated the whole Psalter in an agreeable, but somewhat affected strain, the mode of which was caught from the Italian poets. His seven penitential psalms, with prologues, have been drawn upon by Mr. Holland for his second series of extracts. With all its quaintness, there is a music in Wyatt's versification, which we do not find in the rhymes of some more recent tuners of David's harp. He uses the double final syllable like one who had learned its value in southern models. So, too, the psalm, which Mr. Holland has selected from the three versified by the Earl of Surrey, possibly during his imprisonment in the Tower, bears traces of the gentleman, scholar, and musician, in the nice adjustment of its phrases and the harmony of its metre. On the other hand, we cannot but fancy that the specimen which our author has extracted from the "Goastly Psalmes" of Myles Coverdale, has the nerve and the ruggedness belonging to an iconoclast and a controversialist. This, however, may be "a prophecy after the fact."

We come next to Sternhold and Hopkins, for whom we feel a certain friendliness; placarded though they be in that well known and bitter epigram, which declareth how they

> had the qualms,
> When they translated David's psalms,
> To make the heart full glad.

The two men do not, however, sit upon the same bench as poets, though equally sincere in their zeal, for which sincerity it is that we prefer them to smoother paraphrasers. Sternhold could occasionally rise to a high strain. The Groom of the Robes to Henry the Eighth occasionally renders the loftier passages of praise and exaltation with a pomp of language, which suggests to our imaginations ideas of stately worship—

> —in dim chapels roofed with gold,
> Perfumed with incense smoke,

as vividly as the version employed in the Kirk of Scotland, by its sternness, calls up visions of those rude and lonely places by loch and lynn, where the Nonconformists were obliged to lie hidden from the persecuting eye and the sharp sword of Prelacy. Thus much of Sternhold: Dr. Warton, and with him Mr. Holland, prefers Hopkins, as the more perfect versifier. This may be: and yet, if memory serve us, he was the more common-place and familiar, as in the following example, taken from the seventy-fourth psalm, in which he makes David inquire—

> Why doost withdrawe thy hand aback,
> And hide it in thy lappe?
> O pluck it out, and be not slack,
> To give thy foes a rappe!

To those who are interested in the subject, the following passage, by Mr. Holland, will be welcome, as assigning each of these much vilified old poets his share in the collection:—

"Hopkins translated fifty-eight of the Psalms, forming the Old Version, as indicated by his initials prefixed. He first, however, only published seven; namely, Psalms xxx., xxxiii., lxii., lii., lxxvix., lxxxii., clxvi.; and these anonymously, at the end of the early editions of the collection, versified by Sternhold. They are introduced by the following Preface:—'Thou hast here (gentle reader) unto the Psalmes that were drawen into Englishe metre by Master Sternholde vii. mo adioyned. Not to thentent that thei shuld bee fathered on the dedde manne, and so through his estimacion be the more highly esteemed: neither for that thei are in mine opinion (as touchyng the metre) in any part to be compared with his most exquisite doying. But especially to fill up a place, which else should have been voide, that the boke may rise to his (its) just volume, and partly for that thei are fructefull, although thei bee not fine: and comfortable vnto a christian mynde, although not so pleasaunte in the mouthe or eare. Wherefore if thou (good reader) shalte accepte and take this my dooying in good parte, I have my hartes desire heerin. Farewell.' It is not, however, exclusively as a large contributor to, but equally as the ostensible Editor of, the collected Psalms of the Old Version, that Hopkins is entitled to consideration. As before stated, it is doubtful whether the *thirty-seven* Psalms, first rendered and seemingly prepared for the press by Sternhold, were published by him or not in 1549. The edition of 1551 contains the *seven* additional ones by Hopkins, with the address above-mentioned. Whityngham versified *seven* more, and added them to the collection which he printed at Geneva, where he was residing in exile in 1556: this made the number fifty-one, the whole of which have, sometimes by mistake, been attributed to Sternhold. The remainder of the Psalms having been versified by different individuals, they were first printed altogether, and at the end of the Book of Common Prayer, in 1562, under the title of 'The whole Book of Psalmes, collected into English metre, by T. Sternhold, J. Hopkins, and others. Set forth and allowed to be sung in all Churches before and after Morning and Evening Prayer, and also before and after Sermons.'"

Almost every one of the elder names on Mr. Holland's list, invites us to pause and speculate. After Hopkins comes Norton—that "forward and busy Calvinist," as Wood calls him; not so ascetically Calvinistic, however, but he could help Lord Buckhurst in play-writing, being understood to have had a hand in the tragedy of 'Ferrex and Porrex.' An article, too, could be made on the life and fire-hot zeal of William Whittingham, the next of the psalm-singers. At one period of his career, he was persuaded by Calvin to occupy, at Geneva, the pulpit which Knox had filled—later, he gave his right hand to supply the choir of his church at Durham with the best songs and anthems which the Queen (Elizabeth)'s Chapel could supply—while with his left he rooted out the remembrance of Saint Cuthbert in his own city, by desecrating the works of wood and stone which the Cathedral contained. Strange it seems now, when calmly looking back to those stormy times, that one, who, though no poet, meant to be one—who cared so strenuously for music—should be so eager to raise the hand of intolerance against the work of a brother artist. His tomb was, in its turn, "miserably defaced by the Scots, when they invaded England, in 1640"—a restless close to the history of a restless man.

Passing over Kethe, Wisdom, Churchyard, Pullain, Mardley, the other versifiers of our old singing Psalms, with the carefully collected observations with which Mr. Holland closes this section of his labours, we are once again called to admire the versatile pursuits and accomplishments of that magnificent virago, our virgin Queen. She, too, tried her hand as a sacred poetess; but the verses scrawled by her with charcoal upon the Woodstock shutter; nay, the solitary line cut with a diamond on the window, in encouragement of the young courtier's "fears to climb," contain more of the heart of true poetry than the Fourteenth Psalm, here given by Mr. Holland. Crowley, the next contributor to Mr. Holland's anthology, was almost as various a genius, in his humble way, as Dr. Bull's patroness, and Burleigh's empress; being at once printer, bookseller, preacher, and poet—by courtesy. He translated, too, some of the Catholic Latin hymns, in a publication called 'The School of Virtue and Good Nurture;' but their grand resonant lines must have had a meagre interpretation, if we are to judge from the specimen here laid before us. We are not stopped by any other name of worship or interest, till we come to Archbishop Parker, whose complete

Digitized by Google

version of the Psalms was the next finished after the entire Psalter by Sternhold and Hopkins.

"But whether it was undertaken with any consciousness that others were engaged in a similar way, or afterwards printed with any reference to a comparison with the Version which obtained so firm an hold of the public taste, does not appear. As the Archbishop was a supporter of a settled order of worship in the Church, and as his Psalm Book, although anonymous, was arranged for singing, some diversity of opinion has existed, not only as to his object in composing such a Work, but as to whether or not any copy of it was really known to be extant. Some of our musical antiquaries have conjectured, that the Archbishop, who was skilled in music, and had formerly founded a Music-School, in his College of Stoke Clare, intended these Psalms, which are adapted to complicated tunes of four parts, probably constructed by himself, and here given in score, for the use of Cathedrals, at a time when compositions in counterpoint were uncommon in the Church, and when that part of our choir-service when the motet or anthem, which admits a more artificial display of harmony, and which is recommended and allowed in Queen Elizabeth's earliest ecclesiastical injunctions, was yet almost unknown, or but in a very imperfect state."

The Archbishop seems to have been as over-exquisite in his rhythms as he was over-complicated in the music, to which he adapted his words. But the times were not far distant when stanzas were written in the shape of wedges or hatchets; and perhaps we cannot better show how little the spirit of poetry had to do with such quaintnesses, than by citing three from among the fifty verses of the Archbishop's rhyming Preface:—

Herein because: all men's delight,
Bene diverse found in mind:
I turn'd the Psalms: all whole in sight,
In rhythms of divers kind.

And where at first: I secret meant,
But them myself to sing:
Yet friends requests: made me relent,
Thus them abroad to bring.

Us song should move: as sprite thereby,
Might tunes in concord sing:
God grant these Psalms: might edifie,
That is the chiefest thing.

We are now coming to something more like poetry,—as the psalms by Alexander Scott, and Hall, the anatomist and chirurgeon, and Gascoigne, best remembered, perhaps, for his 'Masque' performed before Queen Elizabeth—will testify to all who turn our author's pages. One step more brings us to Sir Philip Sidney and the Countess of Pembroke, of whom it would be meeter to write in verse, than the lagging prose in which we have mentioned the names of their predecessors, were we to trust ourselves among the accomplished graces and deep affections that marked their lives. The Countess (in this we follow Mr. Holland) was more eminent, in her share of the version, than her admirable brother. She too, like Archbishop Parker, had a taste for quips and cranks, and modes of versification more symmetrical to the eye than musical to the ear. But in the following extract will be found something better than "the principle of the pyramid," for the calligraphical illustration of which it might have been constructed:—

Conferre, O Lord!
This benefitt on me,
That I may live and keep thy word.
Open mine eyes,
They may the riches see,
Which in thy word enfolded lies.

A pilgrim right
On earth I wandring live,
O barre me not thy statute's light.
I wast and spill,
While still I longing grieve,
Grieve, longing for thy judgments still.

Thou proud and high
Dost low and lowly make:
Curst from thy rule who bend awry.
What shame they lay
On me then from me take;
For I have kept thy will allway.

Let princes talk,
And talk their worst of me;
In thy decrees my thoughts shall walk.
All my delight
Thy witnest will shall be,
My councell to advise me right.

Hard by Sir Philip Sidney and Lady Pembroke are a pair of brother Scots—John and Robert Wedderburn, sons of a merchant of Dundee, and scions of a poetical family, since their brother James set in a dramatic form 'The Beheading of John the Baptist.' The three were zealous Reformers; but if they be, indeed, the authors of 'Ane Compendious Booke of Gude and Godly Ballates, changed out of Prophane Sangs,' John and Robert, at least, may be pointed at as foremost among those who, in their eagerness to provide an antidote to Papistry, fell into scandals as flagrant as those they betook themselves to reform. The authors of spiritualized versions of 'The hunt is up,' and 'John cum kis me now,' had no right to thunder out protests against the licences of monkish wit, the Abbots of Misrule, and other such holiday vanities as the comprehensive indulgence of the Romish Church sanctioned, if not encouraged. But, with all their puritanical zeal, the Wedderburns had something of the "divine breath" which is independent of time, creed, or dialect. Let the reader translate the following verse from the Fifty-third Psalm, and (if musical) allow for the *tempo rubato* of the "tempest" in the sixth line, and we think he will be of our judgment:—

As wheill vnstable, and chaffe before the wind,
And as the wood consumed is with fire
And as the flame burning where it can find
The faggot in the field with great impyre;
Sickliyke persew them with thy grievous ire;
Let thy tempest their wrothfulness reuenge,
And let thy storme their pride in purteth change.

The names of Francis Davidson, Queen Elizabeth's Secretary, of Alexander Montgomery, and of Henry Ainsworth, the Brownist, exiled to Amsterdam—

—"a learned man, reduced to deep poverty in the land of his exile, and 'living,' says Neal, 'upon ninepence a week, and some boiled roots, and was reduced to the necessity of hiring himself as a porter to a bookseller, who first of all discovered his skill in the Hebrew language, and made it known to his countrymen—'"

—all tempt us to linger. There is, again, matter enough for a separate treatise, were we to enter on a consideration of the gifts and graces of that wisest of fools and that most foolish of wise men, Gentle King Jamie. But our readers will prefer to have our notice of the first volume of this interesting book closed by Lord Bacon's paraphrase of

Psalm XC.

O Lord thou art our home, to whom we fly,
And so hast always been from age to age:
Before the hills did intercept the eye,
Or that the frame was up of earthly stage.
One God thou wert and art, and still shalt be;
The line of time it doth not measure thee.

Both death and life obey thy holy lore,
And visit in their turns as they are sent;
A thousand years with thee they are no more
Than yesterday, which, ere it is, is spent:
Or as a watch by night, that course doth keep,
And goes and comes unwares to them that sleep.

Thou carry'st man away as with a tide:
Then down swim all his thoughts that mounted high:
Much like a mocking dream that will not bide,
But flies before the sight of waking eye;
Or as the grass, that cannot term obtain,
To see the Summer come about again.

At morning fair, it musters on the ground;
At ev'n it is cut down and laid along:
And though it spared were, and favour found,
The weather should perform the mower's wrong:
Thus hath thou hanged our life on brittle pins,
To let us know it will not bear our sins.

Thou bury'st not within oblivion's tomb
Our trespasses, but enterest them aright;
Ev'n those that are conceived in darkness' womb,
To thee appear, as done by broad daylight:
As a tale told, which sometimes men attend,
And sometimes not, our life steals to an end.

The life of man is threescore years and ten,
Or if that he be strong, perhaps fourscore;
Yet all things are but labour to him then,
New sorrows still come on, pleasures no more.
Why should there be such turmoil and such strife,
To spin in length this feeble line of life?

But who considers duly of thine ire?
Or doth the thoughts thereof wisely embrace?
For thou, O God, art a consuming fire:
Frail man, how can he stand before thy face?
If thy displeasure thou dost not refrain,
A moment brings all back to dust again.

Teach us, O Lord, to number well our days,
Thereby our hearts to wisdom to apply;
For that which guides man best in all his ways
Is meditation of mortality.
This bubble light, this vapour of our breath,
Teach us to consecrate to hour of death.

Return unto us, Lord, and balance now
With days of joy, our days of misery;
Help us right soon, our knees to thee we bow,
Depending wholly on thy clemency:
Then shall thy servants both with heart and voice,
All the days of their strife in thee rejoice.

Begin thy work, O Lord, in this our age,
Show it unto thy servants that now live;
But to our children raise it many a stage,
That all the world to thee may glory give.
Our handy work likewise, as fruitful tree,
Let it, O Lord, blessed, not blasted be.

We cannot conclude without recording, among the contributors to the holy work, the name of pious, accomplished, poetical George Herbert, and of Sandys, whose verses have more of the poet, and less of the priest, than those by any we have named. But with this slight mention of these honoured men, we must close our present notice.

The Despatches of Hernando Cortes, &c. Translated into English, from the original Spanish, by G. Folsom. Wiley & Putnam.

The conquest of Mexico by Cortez is unquestionably the most brilliant achievement in the long series of remarkable events connected with the discovery and early settlement of the New World. There we find the outline, at least, of a great empire, and some civilization, the monuments of which have begun, in our own times, to engage the attention of the learned. In Mexico there was a dense population, there were large towns, and there was that prime mover of human labour and daring—gold, in abundance. This great empire was conquered and the gold won by a handful of Spaniards, led by one who owed his elevation wholly to the caprice of fortune, for Cortez had no experience of war or command, nor had he shown in his early career much passion for romantic adventure. But great prospects gave birth to great hopes, and these kindled inextinguishable passions; hence the disregard of bodily fatigue and the perseverance, in spite of frequent reverses, which certainly mark the progress of all the Conquistadores. Cortez had the advantage, too, of being the first who trod that elevated stage; those who came after him, if they were his equals in heroic qualities, fell short of him in opportunities. Pizarro, the conqueror of Peru, was but a coarse imitator of Cortez; the courage and cunning of the latter became with the former ferocity and perfidiousness. The extraordinary rapidity with which the New World was explored and colonized, was due in no slight degree to the success of Cortez.

The philosopher, it is true, undazzled by the surface of things, may doubt the genius and heroism of the first conquerors of America. Looking at the great inequality in point of arms between the Indians and the Spanish soldiers, he may argue that the conquest of the Mexican empire was, under all the circumstances, an easy achievement for a European of the meanest capacity. Men nearly naked, armed with wooden swords, edged with flints, and frightened at the sight of horses, which were new to them, could not, it is evident, offer any effectual resistance to cavaliers in full armour, wielding Toledo blades, and provided with matchlocks. If Cortez had, therefore, only boundless ambition and constancy under the reverses arising from his own miscalculations, his eventual suc-

Digitized by Google

cess was inevitable. Whatever truth may be in this reasoning, we are certain, that if persisted in, it would leave the world but few heroes. All history—nay, the great globe itself, if analyzed in this way, would go off in vapour, leaving behind but a small residuum of colouring matter and *fæx mera*. We are willing, therefore, to take Cortez for a hero, since he did what appears to the bulk of mankind to have been a great thing. But his exploits are what we admire, not his writings. His letters to the Emperor Charles V. give us but an imperfect, and on many grounds suspicious, account of the conquest of Mexico. For a full and impartial history of that event, as well as for the personal history of the hero himself, we must look elsewhere. Cortez was by no means an elegant writer, and, in this respect, his translator has faithfully preserved the character of the original. Though his narrative is in general tedious and artful, yet it offers some curious passages, and late researches give us reason to believe that his description of the opulence and civilization of the country was not so exaggerated as might be at first imagined. For a picture of national prosperity, long since extinct, take the following account of Tlascala, which still exists, though much decayed:—

"This city is so extensive and so well worthy of admiration, that although I omit much that I could say of it, I feel assured that the little I shall say will be scarcely credited, since it is larger than Granada, and much stronger, and contains as many fine houses and a much larger population than that city did at the time of its capture; and it is much better supplied with the products of the earth, such as corn, and with fowls and game, fish from the rivers, various kinds of vegetables, and other excellent articles of food. There is in this city a market, in which every day thirty-thousand people are engaged in buying and selling, beside many other merchants who are scattered about the city. The market contains a great variety of articles both of food and clothing, and all kinds of shoes for the feet; jewels of gold and silver, and precious stones, and ornaments of feathers, all as well arranged as they can possibly be found in any public squares or markets in the world. There is much earthenware of every style and a good quality, equal to the best of Spanish manufacture. Wood, coal, edible and medicinal plants, are sold in great quantities. There are houses where they wash and shave the head as barbers, and also for baths. Finally, there is found among them a well regulated police; the people are rational and well disposed, and altogether greatly superior to the most civilized African nation."

Add to this the description of the neighbouring state of Cholula:—

"The inhabitants are better clothed than the Tlascalans in some respects, as the superior classes of citizens all wear cloaks over their other dress; similar in shape, material, and bordering, to those of Africa, but unlike them in being provided with pockets. Since the late troubles they have been and continue true and obedient vassals of your Majesty, performing whatever is required of them in your royal name, and I believe they will remain so hereafter. This state is very fertile under cultivation, as there is much land, most of which is well watered; and the exterior of the city is more beautiful than any in Spain, as it contains many towers, and is situated on a plain. And I assure your Majesty, that I have counted from a mosque or temple four hundred mosques and as many towers, all of which are of mosques in this city. This city is more suitable for the Spaniards to inhabit than any of the towns we have yet seen, as it has unoccupied lands and water for cattle, which none of the others have that we have seen; and the multitude of people who dwell in the other places is so great, that there is not a hand's-breadth of land which is not cultivated."

According to Cortez, the houses and gardens of the chief people in Mexico were fully equal to those of Spanish grandees. He describes with much detail his meeting with Montezuma, or as he writes the name Muteczuma, and tells how he took off his own neck a collar of glass diamonds, and put it on that of the Mexican chief—for Cortez never styles Montezuma king or emperor,—and received two golden collars instead of the glass. But here is a passage still more characteristic:—

"Six days having passed, most powerful Prince, since I entered the great city of Temixtitan (Mexico), and having seen some things in it, though but a few compared with what there was to be seen and noted, it seemed to me, judging from these things, and from what I had observed of the country, that it would subserve the interests of your Majesty and our own security if Muteczuma was in my power, and not wholly free from restraint; in order that he might not be diverted from the resolution and willing spirit which he showed in the service of your Majesty, especially as we Spaniards were somewhat troublesome and difficult to please; lest feeling annoyed on any occasion, he should do us some serious injury, and even might cause all memory of us to perish, in the exercise of his great power. It also appeared to me that if he was under my controul, all the other countries that were subject to him would be more easily brought to the knowledge and service of your Majesty, as afterwards actually happened. I resolved, therefore, to take him and place him in my quarters, which were of great strength; and revolving in my mind how this could be effected without occasioning any tumult or disturbance, I recollected what the officer whom I had left in command at Vera Cruz, had written me concerning the occurrences in the city of Almeria, which I have already related, and which, as he was informed, had all taken place in pursuance of orders from Muteczuma. Having used the precaution to station guards at the corners of the streets, I went to the palace of Muteczuma, as I had before often done to visit him; and after conversing with him in a sportive manner on agreeable topics, and receiving at his hands some jewels of gold, and one of his own daughters, together with several daughters of his nobles for some of my company, I then said to him, 'that I had been informed of what had taken place in the city of Nautecal or Almeria, and of the fate of the Spaniards, who had been killed there; that Qualpopoca alleged in defence of his conduct, that whatever he had done was in pursuance of orders from him, which, as his vassal, he could not disregard; that I did not believe it was so, but nevertheless, in order to clear himself from the imputation, it seemed to me proper that he should send for Qualpopoca and the other principal men of that city, who had been concerned in the slaughter of the Spaniards, that the truth of the matter might be known, and those men punished, by which means he would satisfy your Majesty of his loyal disposition beyond all dispute; lest instead of the rewards which your Majesty would order to be given him, the reports of these outrages might provoke your Majesty's anger against him, on account of his having commanded the injury to be done; since I was well satisfied that the truth was contrary to what those men had declared.'"

The offending cazique, Qualpopoca, was brought to the capital, as our readers are probably aware, and, with his followers, was burnt alive. Cortez tells this part of the story with much *naïveté*. "So they were publicly burned in a square of the city, without creating any disturbance; and on the day of their execution, as they confessed that Muteczuma had directed them to kill the Spaniards, I caused him to be put in irons, which threw him into great consternation." All this was manifestly done merely from the motives above intimated, namely, "to subserve the interests of your Majesty and our own security"; yet Cortez had some apprehension lest he might offend royal sympathies, and so, in respect of his demeanour towards Montezuma, he writes to the Emperor:—

"Such was the kindness of my treatment towards him, and his own contentment with his situation, that when at different times I tempted him with the offer of his liberty, begging that he would return to his palace, he as often replied that he was well pleased with his present quarters, and did not wish to leave them, as he wanted nothing that he was accustomed to enjoy in his own palace; and that in case he went away, there would be reason to fear the importunities of the local governors, his vassals, might lead him to act against his own wishes, and in opposition to your Majesty, while he desired in every possible manner to promote your Majesty's service; that so far he had informed them what he desired to have done, and was well content to remain where he was; and should they wish to suggest any thing to him, he could answer that he was not at liberty, and thus excuse himself from attending to them."

Cortez thus describes the original city of Mexico, which he soon afterwards totally destroyed:—

"This great city of Temixtitan [Mexico] is situated in this salt lake, and from the main land to the denser parts of it, by whichever route one chooses to enter, the distance is two leagues. There are four avenues or entrances to the city, all of which are formed by artificial causeways, two spears' length in width. The city is as large as Seville or Cordova; its streets, I speak of the principal ones, are very wide and straight; some of these, and all the inferior ones, are half land and half water, and are navigated by canoes. * * This city has many public squares, in which are situated the markets and other places for buying and selling. There is one square twice as large as that of the city of Salamanca, surrounded by porticoes, where are daily assembled more than sixty thousand souls, engaged in buying and selling; and where are found all kinds of merchandise that the world affords, embracing the necessaries of life, as, for instance, articles of food, as well as jewels of gold and silver, lead, brass, copper, tin, precious stones, bones, shells, snails, and feathers. There are also exposed for sale wrought and unwrought stone, bricks burnt and unburnt, timber hewn and unhewn, of different sorts. * * Every kind of merchandise is sold in a particular street or quarter assigned to it exclusively, and thus the best order is preserved. They sell everything by number or measure; at least so far we have not observed them to sell anything by weight. There is a building in the great square that is used as an audience house, where ten or twelve persons, who are magistrates, sit and decide all controversies that arise in the market, and order delinquents to be punished. In the same square there are other persons who go constantly about among the people, observing what is sold, and the measures used in selling; and they have been seen to break measures that were not true. This great city contains a large number of temples, or houses for their idols, very handsome edifices, which are situated in the different districts and the suburbs; in the principal ones religious persons of each particular sect are constantly residing, for whose use beside the houses containing the idols there are other convenient habitations. All these persons dress in black, and never cut or comb their hair from the time they enter the priesthood until they leave it; and all the sons of the principal inhabitants, both nobles and respectable citizens, are placed in the temples and wear the same dress from the age of seven or eight years until they are taken out to be married; which occurs more frequently with the first-born who inherit estates than with the others. The priests are debarred from female society, nor is any woman permitted to enter the religious houses. They also abstain from eating certain kinds of food, more at some seasons of the year than others. Among these temples there is one which far surpasses all the rest, whose grandeur of architectural details no human tongue is able to describe; for within its precincts, surrounded by a lofty wall, there is room enough for a town of five hundred families. Around the interior of this enclosure there are handsome edifices, containing large halls and corridors, in which the religious persons attached to the temple reside. There are full forty towers, which are lofty and well built, the largest of which has fifty steps leading to its main body, and is higher than the tower of the principal church at Seville. The stone and wood of which they are constructed are so well wrought in every part, that nothing could be better done, for the interior of the chapels containing the idols consists of curious imagery, wrought in stone, with plaster ceilings, and wood work carved in relief, and painted with figures of monsters and other objects. All these towers are the burial places of the nobles, and every chapel in them is dedicated to a particular idol, to which they pay their devotions."

Digitized by Google

These idols were soon precipitated from their pedestals, and images of our Lady and the Saints were set in their stead. The following we do not believe:—

"The figures of the idols in which these people believe surpass in stature a person of more than the ordinary size; some of them are composed of a mass of seeds and leguminous plants, such as are used for food, ground and mixed together, and kneaded with the blood of human hearts taken from the breast of living persons, from which a paste is formed in a sufficient quantity to form large statues. When these are completed they make them offerings of the hearts of other victims, which they sacrifice to them, and besmear their faces with the blood."

The Machiavellian character of Cortez is manifest in every page of his dispatches. He constantly avows his dissimulation and fraudulent intentions; policy was his sole morality, and his occasional frankness was but an artifice to entrap others. While he thus expounds his crafty schemes to the Emperor, are we to place implicit faith in all his representations? Certainly not. It is obvious that his object was to describe his success in the most glowing colours, to figure as one devoted to the Emperor and religion; as an invincible warrior, and beneficent ruler; and, finally, while claiming to have done wonders for the imperial treasury, to excuse himself at the same time for not remitting large sums to Europe. Mr. Folsom demands for him the praise of humanity to the Indians, but we believe that it would require no great research to disprove his claims on that score. Cortez names among the Indians who served with him, "one Istrisuchil, twenty-three or twenty-four years of age, of great gallantry, beloved and feared by all;" and there is reason to believe that this gallant follower of the conqueror is the identical Ixtlilxochitl who wrote in the Mexican language an account of the fall of Montezuma and destruction of Mexico, not by any means flattering to the humanity of the Spaniards, and which account has been translated into Spanish by Don Carlos Maria da Bustamente, himself of Indian descent.

The piety of Cortez has also been much eulogized, particularly by the best of his editors, Lorenzana Archbishop of Mexico; and, in truth, he showed much zeal in the destruction of Pagan idols; but, on the other hand, he had a leaning to the moral and economical institutions of Paganism, which the Archbishop, had he been aware of it, must certainly have condemned for its heretical tendency. Cortez, when at a loss for surplus revenue, bethought him that he could manage the tithes much better than the clergy. In fact, he proposed to the Emperor to vest the tithes in tithe-commissioners, for various uses; but this very bold and curious proposition deserves to be set forth in the words of its author:—

"The plan I would recommend is, that a number of religious persons, (or priests,) as I have already mentioned, zealous for the conversion of this people, should come out, for whom houses and monasteries should be erected in the provinces wherever it may seem proper; and that tithes be assigned them to defray the expense of building their houses, and for their support, the surplus to be applied to the erection and ornamenting of the churches in the villages where the Spaniards reside, as well as to maintain the clergy who officiate in them. Officers appointed by your Majesty should collect and keep an account of the tithes, and with them supply the monasteries and churches; for which purpose they will be more than sufficient, and a balance left for the disposition of your Majesty. Let your Majesty petition his Holiness [the Pope] to grant you the tenths of these parts for this purpose, giving him to understand the service rendered to God our Lord by the conversion of this people, which can be accomplished in no other way; for if bishops and other prelates are sent, they will follow the custom practised by them for our sins at the present day, by disposing of the estates of the church, and expending them in pageants and other foolish matters; and bestowing rights of inheritance on their sons or relatives. A still greater evil would result from this state of things; the natives of this country formerly had their priests, who were engaged in conducting the rites and ceremonies of their religion; and so strict were they in the practice of honesty and chastity, that any deviation therefrom was punished with death; now if they saw that the affairs of the church and what related to the service of God were entrusted to canons and other dignitaries, and if they understood that these were the ministers of God whom they beheld indulging in vicious habits and profaneness, as is the case in these days in Spain, it would lead them to undervalue our faith and treat it with derision, and all the preaching in the world would not be able to counteract the mischief arising from this source."

The English Universities; from the German of V. A. Huber. An abridged Translation. Edited by F. W. Newman. 3 vols. Pickering.

A history of the rise and progress of any institution must always be of interest: however humble its origin, however short its existence, it must have sprung from some mode of thought current among some portion of the society in which it took its rise, or from some want more or less felt in the community. If this be true of every institution, however lowly and short-lived, how much more must it be the case with those still surviving, still flourishing monuments of antiquity, the origin of which is veiled in the darkness of ages, which have watched over the birth and tended the infancy of a nation, have witnessed the rise and fall of dynasties, and have been at once, as it were, the harbingers and the result of civilization. Such institutions are those of which Professor Huber has offered us a history, and we take shame to ourselves that the first connected review of the rise and progress of the Universities of this land should be offered us by the industry of a German professor. We have indeed reason for gratitude, that while we are still unwilling to imitate the patient research of our Teutonic neighbours, we have grace enough left to avail ourselves of the produce of their assiduity, although not without a sneer at the plodding industry to which we owe at any rate almost every work which graces the library of the classical student, whose shelves are crowded with the labours of a Wunder or a Klausen, a Niebuhr, a Müller, a Ritter, or a Schlegel. But a truce to our complaints, of which we have good reason to doubt the efficacy.

Our author is of opinion that the Universities of Europe, as a general rule, either rose out of, or were adopted by, the Church, ever active and ready, in the middle ages, to mould and fashion the minds of nations, and take them under her especial tutelage. The only exceptions which Mr. Huber makes are those of Italy, as Bologna and Salerno, where the eminently practical studies of medicine and jurisprudence prevailed, to the almost entire exclusion of theology and dialectics, the studies most patronized by the Church. The Universities were at first governed and actually taught by a Chancellor, who, however, gradually delegated his office to others, to whom he gave a licence to teach, and who, if actually employed in teaching, became the Magistri Regentes, the regent masters, of whom, in a somewhat different sense, we still hear in our modern Universities. By degrees the Chancellor gave up even his right of examining and granting licences, which power fell to the teachers themselves, and became in some cases an episcopal officer, unconnected with the Universities, and in others a merely nominal head of those bodies.

The division of the students out of the lecture room into nations, as they were called, took place very early. The origin of this arrangement and the time when it commenced are unknown, but in the middle of the thirteenth century we find the system in full operation. Each of these nations elected officers called the rector and proctors, to superintend them, of which the rector afterwards became the one head of all the nations, and of the body of teachers or regent masters. Indeed, it is doubtful whether the rectors ever were the governors of the individual nations alone: most probably they ruled over the collective body of teachers and scholars. The title of Baccalaureus, or bachelor, up to the end of the twelfth century, denoted merely a scholastic, afterwards it became an academic degree, a pre-requisite to that of Master or Doctor.

In order to understand the rise and progress of the various studies, we must premise that in the early centuries, there were two courses, called the Trivium and Quadrivium. The Trivium included grammar, logic, and rhetoric; and the Quadrivium, arithmetic, geometry, astronomy, and music. Out of the logic and rhetoric grew speculative theology and philosophy. The four sciences of the Quadrivium were gradually degraded into mere preparatory studies for the faculty of arts, which was at first the faculty into which all the other studies were absorbed. The introduction of canonical law first gave the theologians the opportunity of establishing a theological faculty distinct from that of arts. The masters of arts were so completely the ruling body that they took the title of Universitas Literaria, while the teachers of law and medicine were considered under the head of Facultates. Gradually, as the deans of the faculties became united with the rector and proctors in the government of the nations, there arose a new *Universitas*, formed out of the old *Universitas* and the faculties. One governor now ruled alike over schools, faculties, and nations: the authority became more centralized, the colleges, and hospitia, or inns, where the students lodged, of which a vestige remains in the New Inn Hall, still existing in Oxford, fell under the power of the governing body of the University. Contemporary with these changes was the claim made by these academic bodies to be exempt from common jurisdiction, which drew so strong a line of demarcation between the University and the people among whom it was settled, and brought on the sanguinary contests between Town and Gown.

Professor Huber is of opinion that the antiquity of Oxford has been undervalued, and is even ready to allow the tradition which connects it with King Alfred. The conflicts of petty Saxon princes and the desolating invasions of the Danes had done much to dim the light which the exertions of Gregory introduced into England. Alfred is pointed out by tradition as the restorer of learning, and the names of Plegmund, Werfrith, Asser, and Johannes Erigena, are but a few of the numerous men of learning whom he is said to have invited over from the Continent. The point in question is whether, in these days of reviving learning, Oxford was one of its chief seats. This Professor Huber answers in the affirmative:—

"No *other* place is authentically named. The story given in the biography of Alfred, by Bishop Asser, explicitly tells of scholastic institutions at Oxford, not only in his day, but as far back as the fifth century. This absurdity has led to the conviction, that the passage is not authentic: yet we may inquire, whether all of it is an interpolation or a part only. My own mature judgment is that the beginning and end are authentic, in which are narrated the contests of the Schoolmen, and the efforts of Alfred to reconcile them. The intermediate part is very awkwardly interposed, and (I think) was interpolated in order to pretend the yet greater antiquity of these institutions. Beside this testimony (in itself assuredly unsatisfactory), we

Digitized by Google

have other proof that before the Norman Conquest Oxford was a seat of learning: and we find in Oxford itself internal marks of some other origin than from Abbey or Cathedral schools. We have testimony that the Anglo-Saxons partook in the scholastic movement of the eleventh century; many of them, indeed, are named as frequenting the celebrated school of the monastery of Bec in Normandy. The political intercourse of England with Normandy, and the extent of British commerce, made this inevitable: and though the only passage in which Oxford is *named*, (viz. by Ingulf, the Conqueror's Secretary,) is not beyond suspicion; it has never yet been attacked. The oldest authentic accounts of Oxford lead us to believe, that its schools are earlier than the Norman Conquest. That scholastic streets (*School-street* and *Shydiard-street*) existed there in the year 1109, is clear from old documents quoted by Wood. A scholastic population must have filled them; and we can hardly allow less than from twenty to thirty years, for the gathering of such a population and erecting of the streets. Now this takes us back just to the horrors of the Norman Conquest and its immediate consequences. None can choose such a date as the conceivable origin of the system: we are forced to carry it higher. We then fall back on the Saxo-Danish period, and on the time when Ingulf is said to have studied in Oxford. Granting that this is the first notice of the system, it is unreasonable to infer that this was its beginning. Indeed even at a later period, it is seldom enough that the Chronicles are led to name the Academicians. Now considering what times preceded the Conquest, we may be sure that at most they would barely sustain existing schools. No reign nearer than Alfred's was likely to originate them. Thus whatever we know at all,—by tradition, by documents (suspected or unsuspected,) or by the evidence of general probability,—converges to the same result,—that the Oxford Schools are as ancient as King Alfred."

This, we admit, is not conclusive; but the evidence amounts to a high probability, and is backed by the tradition handed down since the thirteenth century, of one college in Oxford, University College, which claims King Alfred for the founder. The Chancellor in Oxford was an episcopal one, appointed by the Bishop of Lincoln, in whose diocese the town was situated, while in Paris the Rector, who filled a similar office to the Chancellor, was a creature of the University. It was thus that, in proportion as the Church grew, the Chancellor increased his authority, and thus gave the English Universities that extension of rights which distinguished them from those of Paris and other places. Cambridge is said to have been first patronized by the monks of Croyland, a place thirty miles north of it. A farm called Cottenham, near Cambridge, and afterwards a barn in that town, were the germ of that University which has since spread its name and fame over the civilized world. Cambridge was in its growth in all respects similar to Oxford, save that she was for a long time subject to the authority of the Prince Bishop of Ely, while Oxford was emancipated from episcopal government in the fourteenth century. Of the University revenues Mr. Huber thus speaks:—

"In the whole earlier period, the University-Corporations had been populous and poor. By fees, contributions, impositions and donations, money came slowly in: legacies were rather more productive. Their slender funds, lent out at moderate interest to their own members, yielded a scanty income: but it is remarkable that as yet the University had none but *rented* buildings, and little or no land. They were miserably supplied with Public Rooms for scholastic uses; as nothing of the kind appears to have been University-property. An ill-defined right in Saint Mary's Church was gained by lengthened use. There, or partly in the Church of Saint Frideswide, were kept the monies, treasures, books and deeds of the University: afterwards, the handsome rooms erected by several orders of monks proved a great convenience, being rented occasionally by other teachers. Endowments of course did not exist: every teacher was left to find his own level, and (as we have seen) he generally dwelt with his pupils in the same Hall or Inn. Their food, and other expenses, were defrayed in common: but in the *Disciplina Scholarium* (Ed. of 1496) it is hinted to be convenient, that the scholars relieve the Master from the trouble of all such provision. But meanwhile, the various monkish societies domiciliated in Oxford possessed some landed property, and hereby stood on a different footing; nor is it easy to explain their relation to the University, which was indeed a contested point. Any-how it is clear, that this state of things was essentially democratic."

The nations in Oxford were only two—the Northern men and Southern men, whose feuds frequently disturbed the peace of the University, and who only united to molest their common enemy, the townspeople. The two proctors were elected by the nations till 1626, when the right lapsed to the colleges, and continues theirs till the present time. One of the causes of the riots, with Professor Huber's comments thereon, will surprise the reader. We must remind them that at a time when Oxford was the centre of England, these riots were of no small importance, as is testified in the monkish rhyme, quoted by Wood, thus translated by Mr. Newman:—

"Thus old story says:
From our Oxford frays,
After few months and days,
All England's in a blaze.

"About the end of the twelfth century, the conflicts of Realism and Nominalism began, but they rose into full vigor under the patronage of Duns-Scotus and Occam, in the first half of the fourteenth. The Northernmen declared for their Countryman and his Realism; the Southernmen sided with Occam and his Nominalism. Wyckliffe also, who soon became celebrated, was a North Countryman and a Realist, but it would be far too precipitate to connect Realism with the Reformation *generally*. We only assert, that at *that* period both Realism and Reformation found favor chiefly with the Northernmen; and that the two causes may in *their* minds have been somehow connected. The author believes also, that the Germanic spirit, being prone to Ideology (as Napoleon remarked,) has also in it a certain spiritualism that tended to Protestant views. But all this is said with diffidence and under correction. Any-how it will not be questioned that there is a close sympathy between the Germanic mind and Protestantism, between the Romanic mind and Roman Catholicism; nor is it a mere fancy, to believe that this very controversy was deep at work in the University of Oxford, at a time when none understood the full meaning of their strife. Even at a later period, when all England was decidedly Protestant, as contrasted with the great Southern Kingdoms, the Northern part of England was pre-eminently Protestant as compared with the South. Indeed at the end of Elizabeth's reign, after methods so stringent had been used to suppress the weaker party in the Universities, and so great an internal revolution had passed upon them, we find the contest of Northern and Southernmen renewed, at the time when the Puritan controversy was rising into strength. It is remarkable how much underhand countenance Presbyterianism received at Oxford, (as will hereafter be stated,) even when professedly in disgrace. The distinction of *races* has vanished in the nation at large, and *political parties* have taken their place. We may however remark that Whiggery is of Scotch (or Germanic) origin; while *Toryism* had its strength in the South. The Southern element still prevails in the Aristocratic and High-Church spirit, and in the *old-fashioned* classical studies of the College system; and that this system is truly Romanic, may easily be proved by comparing it with the Universities of Spain, which have suffered least disturbance in recent centuries. The Northern system, driven out of Oxford, took refuge in Edinburgh, the Athens of the North, where everything reminds us of the German Universities and of the German developement of the Reformation. The main strength of the *Liberal* intellectual developement in the last half century has come from Scotland and the North. That is ever the seat of the animating spirit, though the material power which ultimately works out the results will be found in the populous and wealthy South; whether in the seventeenth or in the nineteenth century."

Some of the riots were more serious than those who know them only by a modern "Town and Gown row" would imagine. Professor Huber gives an account of one in 1355 against John Bereford, bailiff of the city, compiled from the chronicler of Oxford, Antony à Wood:

"The causes of this outbreak may be traced back to the year 1349, in which a dreadful plague ravaged all England. It carried off or dispersed all the Oxford scholars, so that the studies were intermitted for three years; after which not one third of the former number reassembled. Meanwhile many buildings, before let out to the academicians, were applied by the citizens to other purposes: the police was exercised by the Town Authorities, undisturbed by University claims; which, upon their renewal, must have appeared doubly oppressive. In fact, the Chancellor had no physical power to enforce them. If the townspeople closed the market gates upon him, he was unable to force his way in, to inspect the bread and beer. If a citizen chose to sell or let to others a Hall which the academicians had previously tenanted, it was in vain for them to plead treaties and privileges, when the door was shut in their face. Bereford and his party were also strengthened unintentionally by that excellent king, Edward III., the great patron of the Universities. In the wide-spread crime consequent on the plague, the Academic Authority was not vigorous enough: the King, perhaps for this reason, at Bereford's representation, issued ordinances for the arrest of criminals by the Mayor and Sheriff; a proceeding which, however needful, broke through the University privileges, and gave dangerous weapons into the hands of its enemies. So intense was the bitterness of feeling generated between the parties, that an explosion soon followed, for which Bereford, it seems, was well prepared. A quarrel arose on St. Scholastica's day (February 10th) in the year 1355, between certain scholars and the host of a tavern which belonged to Bereford. The scholars thought the wine bad; and as the host only answered by ill words, they broke his flasks about his head. The tavern-keeper called for help. Speedily (as if all had been preconcerted) the Town alarm-bell was rung from St. Martin's Church: armed citizens assembled, and fell upon the scholars who were walking unarmed and unsuspecting in the streets. The Chancellor in vain, and at the hazard of his life, entreated the townsmen to keep the peace; at last he ordered the bell of St. Mary's to sound an alarm, and call the scholars to arms. They had taken to flight at the first surprise; but they now rallied, and offered so stout an opposition, as to keep their adversaries in check that night. In the morning, the Chancellor's efforts at pacification were again frustrated by the determined hostility of the Town; and it appeared that the scholars would be murdered, if they did not stand on their defence. Though so inferior in numbers, yet by great exertion they succeeded in seizing the gates, to prevent the entrance of the country people;—a measure of traditionary tactics. But towards evening, about two thousand armed countrymen burnt down the West Gate, and forced their way in, headed by a black banner, with a wild cry of *Murder* and *Plunder*. The scholars, borne down by the torrent, fled into the open country, into their churches or into their private rooms. But the savage mob, that night or next day, stormed most of the Colleges and Halls, and hunted-out the inmates. Those who could not escape were killed, wounded, thrown into the sinks and sewers, or dragged to prison. All their property was destroyed or plundered; after which the mob began to carouse, and abundance of drink inflamed them to still madder deeds. Crucifixes and church ornaments were demolished; students shaven as monks were treated with peculiar cruelty: the scalp was actually torn off the head of some. No holy place was respected. In vain did the more popular of the clergy carry the host along the streets in solemn procession. Monks were seized or maltreated at the foot of the cross or chalice. In short, *forty* scholars or masters are recorded by name, as having been killed in this fray; but these, without a doubt, are but a fraction of those who suffered. As soon as the storm began to subside, and the rabble to decamp with their booty, the more prudent citizens assembled to prevent further mischief. The Town-Authorities also met, with a few of the more eminent Academicians, who had sent to demand

Digitized by Google

assistance from the Bishop of Lincoln and from the King. The former issued an interdict against the Town, and the latter pursued measures, at first equally vigorous. Less energy however appears in their after-proceedings. Perhaps upon examination, the King found the blame to be more equally divided between the parties, than was supposed in the first moment of wrath against so brutal an abuse of victory. At any rate it was clear, that the scholars had begun the fray; and there must have been plentiful ground for crimination against them. That the Town-Authorities had misconducted themselves, does not appear; but the Sheriff of Oxford was displaced by the Royal Commissioners, which may seem to imply that the fault was in a different quarter. There is also ground to believe, that the very intensity of this savage contest gave rise by reaction to feelings of a far more honorable and Christian nature. Terror, grief, repentance and a feeling of helplessness and misery, seem to have driven all the more baneful passions into the background. Both parties were humbled at the common guilt, distressed by the common suffering; and such feelings were widely shared by the nation at large. The whole affair assumed a public importance, and no one was concerned so much to recriminate or retaliate for the past, as to reconcile and prevent for the future."

In consequence of this riot Edward III. remodelled the laws both of the University and the town, and gave the former that preponderating influence which it has since retained. The rise of the fellowships as permanent property is thus described:—

"The earliest *Colleges* were by no means intended to afford their members a permanent maintenance, but to assist clerical students through their course of study, which might last from ten to fifteen years. But when this time was completed, and no promotion opened to them, could they be turned out into the streets and consigned to want and misery? It was against nature to enforce such a thing. In the older Colleges the practice gradually established itself, (though it was looked on as a necessary evil,) that the *Fellows* retained their stipends until they obtained some benefice: and this became the understood or expressed rule in those of later foundation. As then, in the political tempests of the fifteenth century, nearly all other stipends disappeared, and the whole academic population diminished, the College-Fellows became gradually the actual stem of the University. The pecuniary support which they received, gave them a fixed hold on the spot, and as they generally became Masters, and in fact, applied themselves to the business of teaching, they naturally succeeded to the authority of the ancient Teacher-Aristocracy. The academic life was indeed but little quickened by this means, yet it was kept from dying out entirely. It may be hardly needful to add, that the relationship of the Fellows to their College, quite preponderated over that which united them to the University or to their Pupils."

Their wealth was, however, not very great—

"Assisted by the endowment, the *Fellows* of the Colleges lived on through the hard times; yet even they had but the barest necessaries of life, and these not always. Moreover the rules prescribed by the College discipline for study and devotion left but few hours for sleep, food, and recreation. It is indeed clear enough from what we have said above of University, Merton, and Balliol Colleges, that it was not the object of the earlier Colleges that their members should live in pleasure and luxury. Even the richest establishments—such for instance as New College—gave no more than from ten to twelve pounds yearly to each Fellow. The annual revenues of this College were reckoned in the time of Henry VIII. at eight hundred and eighty-seven pounds (v. Chalmers), and that of Balliol College at seventy-four pounds. Those of the others lie for the most part between the two. Bitter complaints were made before Parliament by the Fellows of University College, respecting their distress and want, occasioned by the maladministration of their revenues by the Head of their College. (v. Rol. Parl. iii. 69.) A lively picture of the very frugal circumstances of the Colleges at the beginning of the sixteenth century, containing more special details of what is intimated in general terms by earlier testimony, is to be found in a manuscript written by a scholar of St. John's College, Cambridge; in which, after many bitter complaints of the general distress, he proceeds [in Latin]:—'The greater part of the scholars get out of bed between four and five o'clock in the morning: from five to six they attend the reading of public prayers, and an exhortation from the Divine Word in their own chapels: they then either apply to separate study, or attend lectures in common, until ten, when they betake themselves to dinner, at which four scholars are content with a small portion of beef bought for one penny, and a sup of pottage made of gravy of the meat, salt, and oaten flour. From the time of this moderate meal to five in the evening *they either learn or teach*, and then go to their supper, which is scarcely more plentiful than the dinner. Afterwards problems are discussed, or other studies pursued, until nine or ten o'clock; and then about half an hour is spent in walking or running about (for they have no hearth or stove) in order to warm their feet before going to bed.' It is not very clear, it is true, whether this account includes those on the foundation: but even if, in what is there said, we comprehend only the pupils who bore their own expenses, it gives us a standard to judge the whole by. The difference between the manner of living of the Fellows and of these pupils, was certainly not very great. From Erasmus we learn that the Fellows drank beer, not wine. His letters from Cambridge depict much external meanness there: indeed Oxford appears already to have gained a start of Cambridge in these matters, which until recent times she kept. In more prosperous days we may admit that the Colleges had more to eat and drink, and possibly a fire in the chimney; but no one who considers the above, will imagine them ever to have had luxuries; while, how matters stood at a still earlier time, Chaucer's description of an Oxford clerk may show."

Our space will not allow us to follow Professor Huber through his account of the gradual progress of the studies, and the rising authority and increasing income of the colleges. We can only say that he has executed his task with care and ability. Mr. Newman's translation is clear and vigorous, and his preface manly and tolerant. We may be induced at some future time to examine briefly the opinions advanced by the author and his translator, with reference to the laws and manners of our Universities. At present we must content ourselves with remarking, that we should be inclined to agree with Mr. Newman in much that he says. The plates by which this edition is illustrated may convey some little idea of University manners and customs to a foreigner, but we cannot commend them either for beauty or accuracy. For example, we are introduced in one picture to Oxford students walking in their caps and gowns, *with sticks in their hands*. Now, however trifling the objection may appear, it is of force when we remember the purpose for which the engravings are given, and therefore we shall observe that no student, except the freshest of *Freshmen*, is ever seen in cap and gown, with a stick in his hand; and the proctor addressing them is walking the streets with his ermined hood on—a thing unheard of in Oxford. Nor can we comprehend what idea an engraving of a young man on horseback or playing at billiards can give, in addition to the plain statement that under-graduates do occasionally commit these enormities.

Austria. By J. G. Kohl.

[Second Notice.]

WE return to Mr. Kohl with pleasure. His joyous temperament, which leads him to see, in almost every case, the bright side of things, renders his travels invariably attractive. We resume our extracts with the following market scene in Vienna:—

"The most celebrated of all the women of Vienna is, beyond doubt, Maria Theresa, but the most noted are the so-called 'Fratschelweiber.' Like their sisters in the cabbage-market of Königsberg, and the Halles of Paris, they are distinguished for their eloquence, their presence of mind, and their inexhaustible wit. It is said that the emperor Joseph went once incognito among them, and purposely overturned a basket of eggs, in order to have a specimen of their oratorical powers. Their chief seat is in the 'Hof,' one of the largest squares of the city, where they deal in vegetables, fruit, cheese, and other articles of food. * * I must confess, that often when I returned from the 'Fratschel' market I used to feel as if I had been in a mad-house, so incessant and clapper-like had been the chatter about everything in and about the world—about the '*Germnudeln*' which they were recommending to Herr *von* Nachtigall, an old hairdresser, whose poverty shone out from every side of his worn and rent nether garments, but on whom they bestowed the '*von*' nevertheless, because he held a few kreuzers in hand; about the butcher, 'the stingy hound, who had sold them such a miserable little bit of meat to-day.' They spared neither the emperor, the pope, nor their ministers, and, least of all, the people of rank and fashion, whom they saw driving about. I was one day witness of the little ceremony used with the latter. At the corner of the 'Hof,' a careless coachman ran over a boy. In an instant a crowd of women and men were in full pursuit of the flying vehicle, in which sat a lady and gentleman of the higher class. But the Fratschelweiber paid not the smallest heed to their high nobility. 'Catch 'em there, bring 'em back, the quality candle-snuffers! bring 'em back! the scum of a dunghill! To run over the poor boy!' were the compliments that ran from mouth to mouth, as the mob ran bawling after the gentles, who would probably have fared ill enough, if they had fallen into the hands of the irritated rabble. This class of persons in Vienna are by no means the patient, respectful, timid herd to be met with in other capitals of monarchical states; for example, in St. Petersburg, Moscow, Prague, &c. The child, whose cause was so energetically adopted by the Fratschel women, was not even a countryman, but a little Croat, such as are met with in all parts of Vienna, selling radishes and onions. Beyond a bruise or two he had sustained no injury; indeed, he had rather been knocked down than run over. The women put on his broad-brimmed Croatian hat again, wiped carefully his wide mantle of thick white wool, in which he looked like a diminutive Orlando in a giant's armour, and bought some of his radishes to console him. The child, who understood not a word of the Fratschel jargon, looked round him in a scared manner, and then resumed his monotonous cry, '*An guten ratti, ratti,*' (good radishes,) the only German he knew. These Croats are very numerous in Vienna, and form no inconsiderable portion of the populace there. As they sell nothing but onions and radishes, the Fratschel ladies are persuaded that Croatia must be a poor country, and produce nothing else. In the suburbs, there are, in the public-houses of the lowest class, great dormitories for them, which they call Croat quarters. There, when the ravens return from the fields to Stephan's tower, the poor Croats huddle together after the fatigues of the day, and sleep in the same thick cloaks that have sheltered them from the heat during the day. 'They live like so many cattle,' said one of the Fratschel women to me; 'they haven't even a bedstead, let alone a mattress. They lie o'nights and holidays on their bellies, and are fit for nothing but to sell onions.'"

The Viennese are a poetical as well as a gay race, and their amusements partake of a somewhat Oriental tone. Mr. Kohl thus describes some of their gay doings:—

"The Vienna people are like great potentates, who will admit wisdom only disguised in the motley; but they have reflection enough to recognise the hand of destiny that mingles in the most insignificant occurrences of life. Therefore they will drink their coffee in the temple of the Muses, and swallow the bitter draught of truth sweetened with the sugarplum of cheerfulness. Hence the extraordinary dramatis personæ of Raimund's invention, the Sibyls as old maids, the Genii as bowling-green attendants, the conjurors and magicians from Warasdin and Donaueschingen, who pour forth unweariedly trifling jests and sportive wisdom in Swabian and Hungarian German. The titles of Raimund's pieces and their prevailing style are pretty well known amongst us, not so the style in which the proprietors of places of public resort invite the public to their enchanting

Digitized by Google

popular festivals. I paid at first little attention to the announcements with which every corner of the streets was covered. But one evening late, *i. e.* at eleven o'clock, at which hour Vienna is as still as a mouse, I met a man laden with an enormous mass of printed paper, busied in pulling down the old bills and pasting up new. I asked him to let me look at some of them, and he threw down a whole bale before me. Herr Lanner announced a fête with new decorations and illuminations, under the name of 'A Summer Night's Dream.' Herr Strauss had found a yet more attractive title for another fête, which was to take place at Sperle. By the glimmering light of the lantern I read 'Fancy and Harmony in the rose-tinted vestments of Joy, a rural flower festival and ball.' On a third bill, the 'renowned Daum' promised a 'Festive soirée and conversazione in his Elysium.' Four characteristic bands were announced in the various localities, and further, 'the much admired original representations newly arranged for the present season,' would take place as follows:—In Asia (one part of the gardens) would be displayed three saloons, brilliantly illuminated in the oriental taste; an avenue of palm trees as a promenade, adorned with the newly-invented transparent Iris garlands; and at the end the splendid principal view, giving an allegorical picture of Asia, beyond which the musicians would be heard but not seen. In elegant Europe (another part of the gardens), a Roman triumphal arch would be changed in a moment to an amphitheatre, wherein the Olympic games were to be produced in appropriate costume. In America (a lawn) would be performed the admired Railway passage to Australia, led by the gracefully adorned ladies and gentlemen, Apollo, Pluto, Diana, and Minerva. In Africa (a fourth part of 'Elysium'), beside many favourite performances, Herr Starsch, from Berlin, would have the honour of exhibiting many new feats of dexterity, and, in the splendidly decorated Harem, an African summer fête would be given. As a souvenir of this conversazione, every lady would receive, 'in a festive manner, two views of Elysium,' with an explanation. For the greater gratification of the respected visitors, the atmospheric air would be impregnated with the newly-invented Schönbrunn flower perfume. I believe that not in India itself could a fête for the multitude be announced in more pompous fashion. I noticed many others announced, as 'Nights in Paradise,' 'The Dance of the Sylphs,' &c. Each surpassed the other in high-flown fancies. The chief allurements to all these places are dancing and good music; and the proprietors endeavour on such occasions to procure some new compositions of the favourite composers, Lanner, Strauss, or Fahrbach, composed expressly for that evening. This music has generally some very striking title. A new waltz of Strauss's was called the 'Electric Spark,' another the 'Evening Star,' a third 'Tears of Joy.' Musical soirées and 'Harmonious pictures' are almost always united with these fêtes; and how far the composers of Vienna go with their 'harmony painting,' may be seen from the following specification of such a 'painting' produced when the archducal conqueror of Saïde was the hero of the day. 'Storming of Saïde (a new musical picture). First Part: Approach of the English fleet. Second Part: Approach of the Austrian fleet. Third Part: Characteristics of the Allies, and the Enemy. Fourth Part: Summons to surrender, refusal, disembarkation, attack, cannonading, bombardment, storming and conflagration. Fifth Part: Joyful demonstrations and thanksgivings of the Victors. Sixth Part: Celebration of Victory and triumphal march.'"

Before leaving Vienna we must extract the life-like description of a Sunday promenade:—

"The workday and morning tumult had quite subsided, the constant '*Ho! ho!*' of the hackney carriages, and the '*Auf!*' of the car-drivers were silent, for 20,000 of the inhabitants of Vienna were rolling over the newly-opened railway to the newly-discovered Paradise of Stockerau; and 20,000 were flying by the Raab road to Mödling, Baden, and the other valleys of the forest of Vienna; 50,000 more were gone into the country for the summer, and another 50,000 were gone after them for the day, to forget the troubles of the week in their society. Another not less respectable number of citizens and citizenesses were scattered over the gardens of the suburbs, the Prater, and the meadows, and thus I remained in possession of the inner city, with a remnant of lackeys, beggars, and sick; the Turks might have attacked and taken it at that moment with ease. The domestics were lounging before the doors and conversing with their opposite neighbours; the maids were chattering in the inner courts; the coffee-house of the 'Orientals' was still full of company, for they were scarcely likely to approve of our way of keeping Sunday. In the cathedral of St. Stephen, a few old women were telling their rosaries, and screaming their devotions through the church; and one grating voice among them, louder than all the rest, repeated, at the end of each verse, 'Holy, holy, holy!' In the courtyard of one house into which I looked, I saw a little boy reading prayers aloud from a book. He told me that he was eight years old, and that he did this every Sunday. I took his book, and saw that he was reading the gospel of St. Luke, from the ninth to the fourteenth verse. He said it was the gospel for the day, and that many boys in a similar manner read the gospels on a Sunday before the houses of Vienna. When he had finished, there descended on him, from the upper stories, a grateful shower of kreuzers wrapped in paper. In the usual tumult of the town, I had overlooked many smaller elements of the population, which I now discovered for the first time, as some inhabitants of the waters are perceived only when the tide has ebbed. I noticed, for the first time, the people who hawk Italian and Hungarian cheeses about the streets. They are chiefly from the neighbourhood of Udine, and also sell Italian macaroni. The greater number could speak as much German as they found necessary for their street traffic. There are in all not less than thirty thousand Italians in Vienna, and the passenger is not unfrequently accosted with, '*Poveretta! signor mio! la carita!*' Beggars should, out of policy, always speak a foreign language; it excites far more compassion than the language of the country. Going farther, I found a man standing before a baker's shop, occupied in scolding a little maidservant. She was a Bohemian, he told me, and added, 'That Bohemia must be a very poor country—every year there come thousands of them to Vienna—men and women, maids and boys. They learn as much German as they must, seek a service somewhere, are very moderate in their demands, will put up with a bed in the stable, or on the floor, and when they have earned a few florins, they go back to their own country.' In fact, if we inquire of a hundred people we meet in Vienna what country they are from, the answer of twenty, on an average, will be, '*Ich bin ein Behm*' (I am a Bohemian). The whole number of the Slavonians in Vienna is, it is said, about 60,000, and of other Non-Germans 100,000. In the highest circles as the lowest, the foreign element mingles everywhere. The number of Hungarians is reckoned at 15,000; but of these many are not genuine Magyars. * * At last I came to the end of the city, and went out upon the Glacis. Here seemed to be gathered together all whose legs were too short to gain the open country beyond the extensive suburbs of Vienna. It was the part called the Water Glacis, where there is some gay music every afternoon; numbers of little children with their nurses were lying and playing about the grass, and several schools under the guidance of their masters were doing the like. Some of them had pitched a tent in one of the meadows near which they were diverting themselves. There is no other city in Europe where the children have such a playground in the very heart of the town. The benches were bare of other visitors, with the exception of one solitary Turk seated among the children. He was taking his coffee, and dividing the '*kipfel*,' that had been brought him with it, among the sparrows, which are constantly flying in numbers round the Glacis. I sat down by him to share in both his amusements, and remarked a trick of the sparrows that I had never before noticed. Some of them were so greedy, that they kept fluttering in the air about us, and sometimes snatched a morsel of bread before it could even reach the ground, where the others were eagerly picking up the scattered fragments. Like a polypus turned inside out, the inner life being displayed externally, the dead exterior skin turned within, even so is the life of Vienna reversed on a Sunday. The swarms that on other days are driving and bawling in the streets and public places in the city, are then singing, dancing, eating, drinking, and gossiping in the houses of public entertainment without. All this humming and drumming was so little in unison with my idea of a Sunday walk, that I was glad to take refuge from the noise in a place I was sure of having more to myself on a Sunday than any other day—the flower-gardens and churchyards. Beethoven's monument stands in the Währinger cemetery. His simple family name is inscribed in gold letters on the stone; but of late the growth of a bush planted near it has almost overshadowed the letters. I asked the sexton why he did not cut away the boughs that the name might be more plainly seen; he said the friends would not allow it to be done."

The fair at Pesth gave Mr. Kohl an opportunity of hearing the noted gipsy music of Hungary. The scene was a dancing-booth, where meals of all descriptions—*déjeuners*, *dîners*, and *thés dansants*—were furnished:—

"The company was wholly composed of peasants; and the narrowness of the space in which they moved was compensated amply by their zealous endeavours to make the most of it. They lifted up, swung round, let go, and caught up again, their fair ladies, in a most vigorous and praiseworthy style; and the noise of stamping equalled that of a hundred threshing-machines. The heat was overpowering, and the dust suffocating; for, besides what was raised by the toils of the dancers, clouds came in at the open doors and windows, from the fair outside, where herds of cattle were moving in all directions; and the sensations occasioned by heat and dust were not diminished by the clangour of the gipsy musicians, with their trumpets and cymbals. Throughout Hungary the musicians are almost exclusively either Germans or gipsies; as the Hungarians themselves have in general little taste or talent for music. I do not mean that they are absolutely insensible to harmonious sounds, for what people ever was? but I speak only of the comparative susceptibility, and of their practical musical talents. The German musicians of Hungary hold, of course, the highest rank, and are met with in the principal theatres and churches, at the balls of the upper classes, and in the first-rate hotels; but the gipsies fill the lower appointments, such as those in the small theatres, and in the smaller towns they are the sole professors of the art. The Germans in general play none but German, French, or Italian music; but the gipsies the true national compositions of Hungary, which breathe a peculiar spirit, and are distinguished by certain original turns and phrases, which I never remember to have heard anywhere else. There is, however, a strong resemblance between all these Hungarian gipsy melodies, and it is easy for any one who has heard one of them, to recognize others. Among the Tatars, also, at least among those of the Crimea, the gipsies are the usual musicians; I had often heard them there, but could not recollect enough of their music to know whether it resembled what I heard in Hungary. I could easily understand the partiality manifested by the people generally for this music, for there is something in its character so wild and impassioned—it has tones of such deep melancholy, such heart-piercing grief, and wild despair, that one is involuntarily carried away by it; and although, on the whole, the performance of the gipsies is rude and wild, many of them manifest so much of real musical inspiration, as may well make amends for their deficiencies in scientific culture. There are several gipsy bands which are celebrated throughout Hungary, and some of the patriotic journals even cite with rapture some performers of the last century. Anecdotes are also often seen in these papers tending to exalt these gipsy favourites above their more renowned brethren of the divine art. Thus, for instance, we are told of some pieces of Beethoven having been performed on a certain occasion, and received with immense applause, when some gipsy musicians entering, and playing some simple 'Magyar Notas,' the whole assembly was silent, and melted into tears. Even the German performers are sometimes compelled to learn some of these 'Magyar Notas,' with which they will often conclude, in order to leave a favourable impression on the minds of their audience, and '*Egy Magyar Nótát* (now play us something Hungarian), is a common request at the close of more elaborate foreign

Digitized by Google

compositions. There is, however, much monotony in this, as in all other national music; and the more cultivated even of native auditors are glad, after a while, to return to the greater variety and intellectual richness of our German compositions."

At Pesth, Mr. Kohl visited the bridge now constructing under an English architect, and which, as it seems, is to introduce a little English liberty:—

"Another difficulty by which the subject of this bridge was brought before the diet, consisted in certain privileges of the nobility which it would be necessary for them to renounce. The whole body of Hungarian nobles, namely, have been hitherto entitled to pass either on foot or horseback over the Pontoon bridge, without paying the toll demanded of all unprivileged passengers. Baron Sina protested against any such exemptions in the case of the new bridge, and refused to advance the sum required, unless all persons whatever were subject to the toll. The said privilege, however, is so intimately connected with that of passing free over all roads, bridges, and highways of the kingdom, and finding, 'I am a nobleman,' accepted at all turnpikes instead of a certain amount of kreuzers, that the privileged orders dread of all things an attack upon this right (or wrong) as the first breach in their grand aristocratic circumvallation. Many of them, therefore, refused long and obstinately to make this concession; but their resistance was at last overpowered by the exertions of more liberal men, and the undertaking fairly commenced. The first shot has been fired, therefore, but it will be long yet before the breach is sufficiently widened. For my own part, I own I could not witness without disgust the exercise of this petty but insolent privilege at the old Pontoon bridge. Let the reader imagine a row of mustached fellows, most of them (alas) speaking German, opening their barrier not only to every noble, but, according to a custom which has slipped in, to every well-dressed man, and seizing by the arm, and rudely demanding the toll of every poor working mechanic, every Jew or peasant boy that passed. These bridge-guards, by long practice of their trade, have acquired such a lynx-eyed dexterity, that even on Sundays and holidays, when the mechanic is often as elegantly dressed as the noble, they are never deceived. They know by sight almost all the inhabitants of Pesth and Buda, as well as their children and the inmates of their houses, and can tell in a moment who does, and who does not, belong to the privileged orders. The rich Jews generally pay a certain sum yearly to avoid the annoyance of being stopped whenever they pass; and I have been informed, that, curiously enough, the gipsies enjoy the same exemption as the nobles. '*Les extrêmes se touchent*,' or they are perhaps regarded as such complete nullities in society, that they are allowed, like the free commoners of nature, the birds, to fly in and out as they please. I cannot conceive how it happens that the upper classes cannot muster magnanimity enough to subject themselves voluntarily to this trivial tax, if it were only to avoid the disgrace of the thing: it is strange too to think, that any people should long submit to such a miserable species of oppression. Many abuses are no doubt of more importance, but this is of so open and barefaced a character! The great man walks by unquestioned, with his purse full of ducats, while the poor one, the very beggar, is forced to rummage among his rags perhaps for his last kreuzer. Blessed, therefore, be the new edifice which is to introduce a better system! Blessed be its foundation-stone, which is to be at the same time the foundation of Hungarian equality and true freedom!"

A short account of the descent of the cataracts of the Danube may not be without interest:—

"A little below Moldova, however, a very startling phenomenon makes its appearance, for to the height of twenty fathoms there arises from the very midst of the river a huge rock, with frowning chasms, jagged edges, and pointed teeth. This rock is called by the inhabitants the Babagai, or 'wicked woman.' Immediately below it is the commencement of a series of perilous whirlpools and rapids. I am unable to speak with any certainty of the height of the mountain walls at this place, but I was told by those whom I questioned, that their height could not be under 300 fathoms. Rocks and mountains then of the same height as these walls, similar in all respects, jagged and rough, and cut by deep ravines and valleys, are sown in the bed of the river itself, and tower out of the water on all sides. The highest of these is the *Tristovaczer Spitze*, below which the cataracts of the Danube begin. Scarcely had we passed this rock than we heard a dull hollow roaring in the water, and saw the dark heads of the dangerous reefs which here run right across the river. The rowers exerted all their strength and redoubled their exertions, for it is not enough that the excited waters drive on the boat till it flies before them with the rapidity of an arrow, the rowers must labour with all their might and main to increase this rapidity. If they were to proceed slowly and cautiously, by way of avoiding the rocks and reefs, they would inevitably be caught and swallowed up by one of the numerous whirlpools. The boat must cut them rapidly and decisively, like a knife, and the utmost precision, boldness, and local knowledge, are required in the steersman. As in human life, wherever whirlpools and rapids lie in our course, the timid and fearful are sure to sink, while the courageous steersman who redoubles his energy, and exerts all his experience and judgment, passes victoriously through every peril. The transition from a quietly-flowing river to a wild eddying and whirling torrent, is, of course, gradual. At first the water only runs with greater rapidity. By degrees, small vortices and then greater ones begin to appear. As we advance, the pools increase in depth and circumference, and their edges lap over more and more upon one another till the whole becomes one vast, roaring, foaming, eddying, whirling vortex. We all stood in the forepart of the boat, near where the rowers sat, many of us stretching our heads over the side to witness the wild and awe-inspiring tumult of the elements. The children alone continued to play with careless unconcern, regardless of the dangers around them. The steersman stood aft, gazing steadily upon the stream. Upon his energy and skill our safety depended. The measured, steady motion of the oars, as they cut the convex swelling bubbles in the whirlpool, formed a fine contrast to the wild, stormy confusion of the waters. I cannot say exactly how long the tumult lasted. It began three times anew, forming three separate whirlpools. The breadth of the Danube, in the narrowest part of this pass, is only a hundred fathoms. Below Pesth it is 600 fathoms broad, and below Belgrade it is a perfect sea. This vast mass of waters, enriched by innumerable tributaries, is here forced through a channel so extremely narrow, and no vent is to be obtained either by inundation, or by any other means. It is this which gives the whirlpools, and the cataracts which follow them, such tremendous force and impetus. It is wonderful to see the whole united volume of water pouring itself down one steep and narrow defile with the rapidity of lightning, and more than the noise of thunder. To estimate the exact quantity of water which is poured down the Clissura is impossible, for the depth of the river has never been ascertained with any degree of certainty; indeed, it is so very various at different parts that to find a just average is scarcely possible. At one place the boatmen said 'Here the river is forty fathoms deep;' and at another, 'Here the rocks are only two feet below the bottom of the boat.' Sometimes it happens that the boat, dancing wildly upon the waves, scrapes upon a rock, yet it is very seldom that an accident occurs. Out of 100 vessels 99 get through the pass in safety. One may afford to risk life with such odds in one's favour."

Had we space we might quote from the interesting account of the military dispositions of the frontier, and the author's opinion of their use and advantages. But we must bid farewell for the present, in the hope that we shall meet Mr. Kohl in many other fields of research and pleasant anecdote. He has recently visited England, and we may therefore expect from his graphic pen a sketch of ourselves and our country.

The Drama in the Middle Ages. By Dr. Görres.
[Second Notice.]

BEFORE the days of Marlowe and Shakspeare, "Mysteries," with their less spiritual kindred "Moralities," had ceased to be the staple amusement of the people. The last was performed, according to Prynn, during the reign of James the First, when 'Christ's Passion' was played at Ely House, in Holborn, on Good Friday, in the presence of thousands of spectators. In Germany, however, even at the beginning of this century, they were not uncommon; but the all-annihilating wars, of which that country has been the theatre, and the secularization of the monasteries, put an end to such peaceful recreations. Ammergau is one of the very few places in Germany (we have failed to discover any other,) where the old custom is still kept up: and this brings us to the passion-play there represented. Its origin is related in the following tradition:—

In the year 1633 a virulent and contagious pestilence broke out in the neighbourhood of the Vale of Ammer. The inhabitants of Ammergau took all possible precaution to prevent its reaching to them. But an Ammergauer, who was at work at Eschenlohe, a village in the infected district, escaped the vigilance of the *cordon sanitaire*, and returned home across the mountains. Two days elapsed, and he was a corpse. The poison was disseminated, and within three weeks eighty-four persons fell victims to the disease. The villagers, in great consternation, vowed a vow to God to perform a decennial mystery, being 'The Atoning Sacrifice at Golgotha, and the History of the Passion and Death of Jesus.' Wonderful to relate, the plague immediately ceased, and not a single one of the many who lay sick of it died.

From that time this 'Passion' has been regularly performed in scrupulous observance of the vow, except some slight irregularity in the time of Napoleon's wars. Some talk there was, it is true, of following the example of other places, and terminating this antique ceremony altogether. But the celebrated Bavarian minister, Mongelas, happened to be present at a representation of it in 1815; and though not remarkable for any peculiar homage to the hierarchy, he became so interested in it, that he was instrumental to its continuance, and thus this scanty memorial of the past has been rescued from oblivion. In process of time the old piece has become interwoven with dumb shows of the types and shadows contained in the Old Testament. Alterations, too, have been made in the text, and its monkish rhymes converted into blank verse;—hence the play, as it is now acted, presents but little that is characteristic either as regards expression or idea.

The actors are from 300 to 400 in number, including persons of all callings and ages. Without exception they are natives of the village. The ass, albeit, on which Our Saviour rides, is from the adjoining hamlet of Unter-Ammergau, —*i. e.* the lower, this being the upper village of that name. Indeed, the exclusion of strangers from the *dramatis personæ* is carried to a degree almost puritanical. "A female of the village entered into a Wurtemberg monastery. On that institution being subsequently suppressed, she returned home with a pension for life. She had been so long absent that she was no longer considered one of them, and could aspire to no more elevated part in the play than that of a mute."

No less strict and scrupulous are the villagers about the morals and manners of life of the players; and if it be discovered that any one accustomed to fill a principal character has become a tippler, or of irregular habits, he is degraded into a third-rate actor. Propriety in dress and manner is the order of the day.

The alpine village of Ammergau is—we can speak from personal knowledge—a most romantic spot; the abrupt precipices around, the favourite haunts of the bounding chamois and sleepy marmot; afar off the lofty glaciers, from whose snowy sides the thousand petty rills have tumbled down to form the pellucid Ammer-stream,

Digitized by Google

which courses through the fertile meadows skirting the village; the place itself, called in the old *Ulm* chronicle, the prettiest in Germany; and, above all, the secluded quiet of the scene, unite to form a picture only to be found in the neighbourhood of the Tyrolese Alps. It is one of those spots which are very apt to escape the observation of your *grand chaussée* tourist, who travels merely because it is the mode, and that he too may gabble, as well as his neighbours,—

About the Alps and Apennines,
The Pyreneans and the River Po.

The theatre for the occasion was constructed of wood, outside the village. The seats had no other covering but the sky: the stage alone was protected from the weather. Everything was pristine; almost a realization of the Roman bard's description:—

No veils were *there* o'er marble structure spread,
No liquid odours on the audience shed;
The nearest grove supplied its choicest green,
And clustering branches formed the artless scene;
Rude seats of turf in order rose around,
Where sat the swains with oaken garlands crowned.

Before entering minutely into the construction of the stage, we will, for a moment, refer to Strutt's remarks on this part of the early English theatre. "What is now the stage, consisted of three several platforms, or tiers, one above another: on the uppermost was perched the Pater Cœlestis, surrounded by his angels; on the second holy saints and glorified men; while the lowest was occupied by those who had not yet passed from the transitory state to the regions of eternity. On one side of the lowest platform was the semblance of a dark, pitchy cavern, from whence issued fire and flames, and when necessary, the audience was treated with discordant yelling and noises; while, ever and anon, for their delight and instruction, devils ascended from beneath." Our mountain Thespians pay more regard to the nerves of the present generation. Lucifer formerly commenced the piece with a chorus of demons, but this kind of Proem is now studiously avoided, perhaps to prevent the chance of any such untoward events as marked the *début* of the Eumenides in the Æschylean Tragedy.

The construction of the stage (says our author) does not present the old subdivision into heaven and earth, but is very appropriately contrived for the representation of the piece; for as this consists of dumb show types from the Old Testament, and acted dramatic scenes from the New, the stage is also divided into two parts. In the centre of the great stage, and somewhat backwards, there is another smaller one, concealed by a drop-curtain. To the right and left, between the side-walls of the theatre and this double stage, one sees two streets of Jerusalem going back deep into the distance. The intermediate space on either side between these and the stage, is filled up by two houses, provided with balconies.

This plan is peculiarly adapted for the multitudinous processions that from time to time emerged from the background and again disappeared. Classical antiquaries may perhaps be interested to hear that the learned and well-known scholar, Professor Thiersch, of Munich, has discovered the above to be the exact model of the old Athenian stage.

The number of spectators was about six thousand. The various costumes of the Tyrolese, Bavarians, and Swabians, presented a very interesting sight. Most of the females had thrown red or white kerchiefs over their heads as a shade against the sun, which glanced down—by the bye, not the least *ardent* of the spectators. The heavens glowed mildly in all the cloudless depth of blue that belongs to the southern landscape. Upward soared the carolling lark, around looked down the bold Alpine peaks in tranquil majesty, and high aloft one might discern the cross surmounting the giddy precipice of the beetling *Männel*. All was in a fever of expectation for the commencement of the play. At last the church clock tolled eight. The mortars gave the signal, from the right and left issued the chorus to the sound of music, and the passion-play began.

But a word on the chorus. They were twenty-two in number, eleven of either sex, and it was their duty to interpret each intermediate *tableau* to the audience, and prepare them for its connexion with the acting part that was to follow.

They first commenced with a prologue, generally explanatory of the whole piece. The curtain was then drawn up, and exit chorus; while far off in the background a triumphant procession is descried, marching along in slow solemnity. The Saviour himself riding upon an ass, and surrounded by his disciples. Some of the people then cry 'Hosanna!' and wave branches of palm, others strew their garments in the Lord's path, and mothers, in voluminous Oriental costumes, extend their infants to receive his benediction: all is happiness and rejoicing. This scene closes with the expulsion of the money-changers from the temple. After which re-enter chorus, and the choragus explain how the envy of the priests and pharisees conspired for the destruction of Jesus, and show how this had been typified by the story of Joseph and his brethren. This said, the chorus pair off to the right and left, and take up their stations at the opening of the aforementioned streets. The inner curtain is elevated, and we see the Plain of Dothan, with the well into which Joseph was cast. Two of his brothers stand (of course without movement) gazing into it. The rest are in various attitudes, meditating, apparently, on what they had done.

But it is not our purpose to follow the progress of types and anti-types, down to the ultimate catastrophe. A few further remarks will suffice. The tableau from the old testament, where Joab, under the pretext of a kiss, stabs Amasa, thus shadowing forth the "kissing traitor" Judas, is mentioned by the writer, as a very effective one. We will render literally the explanatory song of the chorus, as a specimen.

Chorus. Ye rocks of Gabaon
Why stand ye desolate?
Enveloped thus in garb of woe,
Ye, once the region's pride!
Tell, we conjure *ye*, tell us what befell.
Echo. Fly, wanderer, fly;
Accursed is this bloody place;
Here fell, by murderous hand assail'd,
An Amasa, &c.

Another tableau, the falling of the Manna, was "wonderfully real," and farther on he says—

The beholder might have fancied that the persons represented were actually then before him. At one time the tableaux reminded me of the paintings of Leonardo da Vinci and Paul Veronese, at another of the Tyrolese painter, Martin Knoller, many of whose works are preserved in the neighbouring monastery of Ettal. The only change I should wish to see would be in the vestiture of the chorus, whose parti-coloured feathers and sandals would be more in keeping with the *Opera Fernan Cortez* than a play of the Passion.

The acting gains his special commendation. Respecting the difficult and fatiguing part of Christ, we are told, "It was not acting, but holy earnest. Propriety and dignity accompanied each movement, and under the roughest treatment, he stands before us like a king." There was much less mouthing and ranting than could have been expected among a set of illiterate mountaineers, suddenly finding themselves in so unusual a position. The chief drawback was their *patois*, which, as the place is situated nearly on the confines of Suabia, Bavaria, and Tyrol—countries none of them in high repute for 'streams of *German* pure and undefiled'—will not excite astonishment. The performance was continued till *six o'clock in the evening*, only deducting an hour for refreshment at mid-day. Many an eye was moistened with tears; and stifled sobs, as we were told by an eye-witness, testified how deeply the hearts of the simple hearers were penetrated—all quite of a piece with the fervent and religious temperament of these artless mountaineers. "This land of the mountain and the flood," may be said to be "meet nurse for a *religious* child." Heaven's warning is heard, how often! in the thunder that echoes from their cliffs. The runnel, that creeps along to-day making sweet music with the enamelled stones, is on the morrow a tearing cataract, carrying ruin and desolation to their smiling fields and humble cabins. Can we wonder that this people are sober and serious, and stricter observers of religious ordinances than their fellows of the plain? Their solemn greeting, "Gelobt sei Jesus Christus," prettily alluded to in one of Bürger's best ballads, must be familiar to many of our readers. We know not whether it has been their fate—it has been ours—to arrive at an obscure hostelrie, on a Friday evening, hungry and weary; yet no entreaty could procure animal food. "Morgen kriegen sie Fleisch, heut nit." "To-morrow you'll get meat, to-day none," was mine host's decisive answer—and soon his sonorous voice was heard in even-tide prayer. This is true of every house in the village.

One word more touching the Passion. Be it known that it will take place again in the autumn of 1850, and should any of our readers have the good fortune to be then within a day's journey, we counsel them not to miss the "Ammergau Passion-Spiel."

OUR LIBRARY TABLE.

Australia and the East, by John Hood.—An unostentatious record of the author's journeyings and wanderings in Australia, India, &c. Mr. Hood is an experienced farmer, and one whose opinion is entitled to great weight. He went from England to Sydney in an emigrant ship, and his experience therein will prove useful to those who purpose to follow his steps, and his observations on Australia will be especially valuable to all who have thoughts of settling there. Yet there is but little that is new in the work, though the simple, honest, and unaffected style in which it is written will please readers of all classes and conditions.

Hints on the Formation of Character, by a plain spoken English Woman.—The views here presented are clear and simple, and calculated to do good. The "English Woman" speaks out plainly with regard to the many corruptions of conventional society. The work is less limited in its subject than most of those devoted to the same purpose, and the writer is not confined by bigotted attachment to any particular theory.

Nature; Napoleon's Entry to Hades; and other Poems, by Benjamin Wale.—Mr. Croly, Mrs. Hemans, and Miss Mary Anne Browne, are in turns imitated by Mr. Wale, who, according to his preface, is a very young poet. On this ground, we will not take exceptions to his mocking-bird propensities; and besides, an occasional ease and sense of the picturesque are apparent, which will further justify our leniency.

An Inquiry into the Merits of the Reformed Doctrine of Imputation as contrasted with those of Catholic Imputation, by V. Livingston.—This is the work of a convert from Protestantism. Into a consideration of its merits or demerits, being purely theological, we, of course, shall not enter. The author charges the Oxford divines with inconsistency in their teaching, and devotes a considerable portion of his work to canvassing their doctrines.

Brief Thoughts on the Things of God and the Soul, by E. Dalton.—As these Thoughts are expressed in words of one syllable, and must therefore be intended for the young or ignorant, we should not have been surprised had we found them somewhat cramped in style, and not very clear in expression; but we had all the more right to expect that they would be plain and simple. This, however, is not the case, and these Brief Thoughts would have been much better had they been much more brief.

The Practical Bee Keeper, by J. Milton.—Brief instructions for the management of Bees, containing incidentally an advertisement of Mr. Milton's hives, and where they may be purchased.

The Rhine; from the French of Victor Hugo, by D. Aird.—A new version and a cheap edition, illustrated with wood-cuts.

Thoughts on Popery, by the Rev. W. Nevins, D.D.—One of the least exceptionable books that has proceeded from the Protestant Association: but it contains nothing new.

THE POET'S PATH.

THE poet's path of old, it passed
By Grecian grove and hill;
And through the wrecks of war and time
We trace its splendour still;
For there the ancient temples rose,
As at the thrilling call
Of that Egyptian wanderer's lyre
Arose the Theban wall.

And since o'er many a distant shore
That starry path hath shone,
For gleaming through the Polar night,
It cheered the frozen zone;
The old Crusaders saw it shine
Through realms of Eastern bloom,
And the wanderers of the Western woods
Amid their leafy gloom.

But, like the ocean-doomed, who sought
The happy isles of yore,
The feet that seek that pleasant path
May turn aside no more;
For tuneful lips that once have quaffed
The bright Castalian rill,
Though never more they taste the wave,
Will wander by it still.

As he who traversed lands of old*—
The glorious and unknown—
Returned at last in age to be
A stranger in his own;
So hearts that early leave the dust,
That upward path to share,
Forgotten lose their hold of earth,
And seem but strangers there.

But oh! what glorious visions shine,
What lovely scenes arise,
Around that mystic path, to win
From earth the pilgrim's eyes!
Though ever seen through thorny brakes,
Or wastes of trackless sand,
As Israel from the wilderness
Beheld his promised land.

Long, long, the early Muse hath left
Her own, her Grecian isles;
And long the Runic harp is hushed
Among the Northern wilds;
And o'er the poet's path a flood
Of time and tears hath swept;
But still 'tis all of Eden which
Our fallen world hath kept.

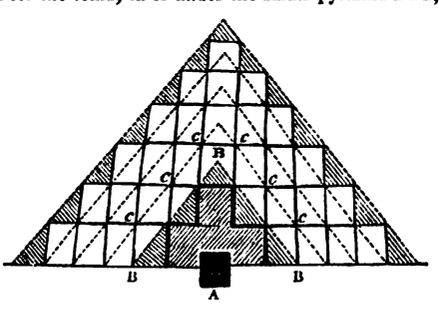
Sept. 3. FRANCES BROWN.

* Marco Paolo.

FOREIGN CORRESPONDENCE.

Cairo, August 17.

THE last monthly meeting of the Egyptian Society was very fully attended, as it was announced that Dr. Lepsius would give some description of the researches made by the Prussian Expedition.



Mr. E. W. Lane being unanimously called to the chair, Dr. Lepsius commenced by stating that he felt it to be his duty, whenever he had the opportunity of visiting Cairo, to communicate any information that he might consider interesting to so useful and liberal a Society. He felt assured, from the great progress already made in the few years since its establishment, that it was destined to fill an important place in the history of scientific research in this country. The Doctor then alluded, in proof, to the valuable memoir lately published by the Society, contributed by M. Linant 'Sur le Lac Mœris.' He offered some observations on the mode of constructing the pyramids, and enumerated the many theories that had been advanced concerning the objects and the construction of these vast monuments. He, however, considered the fact established, that their object was simply to mark the places of tombs, and he then proceeded to explain to the meeting the manner in which they were constructed.

The great pyramids of Gizeh are (in comparison with many others) in a good state of preservation. From the largest, little besides the casing stones have been removed. In the second pyramid a part of the casing yet remains. In these it is impossible to see the interior construction of the stone work. But some of the small ruined pyramids at Gizeh consist of several steps, each of several courses of stone-work in height, instead of the usual form of four sides regularly converging to an apex; and in the more ruined parts of these pyramids it is seen that the steps are formed by walls built against each other, as shown by the dotted lines in the following sketch.

The masonry of the pyramids of Abousir and Saccara is very inferior to that of the pyramids of Gizeh—in all of these the step construction is clearly seen, and also that the steps are separate walls built against each other. The pyramid at Merdoon, again, exhibits this mode of construction. In its present form it rather resembles a huge square tower, the walls of which are slightly inclined, than a pyramid: the outer layers having been mostly removed, the core or central part is left standing alone. In short, in the examination of a great number of pyramids, from Gizeh to the Fayoom, the same mode of construction was found.

To explain a mode of building apparently so contrary to sound masonry, we must suppose a chamber A for the tomb, in or under the small pyramid B B B,

built over it: by filling up the angles of the steps, and adding the fine smooth casing stone, this small pyramid would be completed; but if it were desired to enlarge the work, instead of filling up the angles to prepare for the casing, another step, of the same height and depth as the first, being added to each step of the first mentioned pyramid, the outline touching the exterior angles of these steps, *c c c*, &c. would be parallel to the outline of the first pyramid; and so on, by continually adding steps of the same section, the pyramid would be increased to any size. The foregoing sketch thus shows five pyramids, one within the other. Dr. Lepsius stated that he was indebted to Mr. J. Wild, architect, for this suggestion, and it agrees with and explains the account given by Herodotus, who states that machines were placed upon the steps, and the stones raised from one step to another. The Doctor then explained, in confirmation of his views, the remarkable pyramid of Dashour; he considered the obtuse angle of the upper part, as the original angle intended. Moreover, Dr. Lepsius observed that this mode of proceeding is in harmony with that adopted by the Egyptians in their tombs excavated in the rock. It is found at Thebes that the first care of the reigning king was to excavate in the rock, and complete and decorate, a chamber for his tomb. If his life continued after the end of this labour, another chamber was added, and then another, and so on; and it is found that the largest tombs are those built by the kings who have reigned the longest. In the same manner, the pyramids may have been continually enlarged during the lifetime of the kings for whom they were intended. All the evidence that remains shows that the largest pyramids were of kings who reigned a long time. It must be remembered, that among the Egyptians it was the duty of the individual to provide a tomb for himself; his successor was immediately occupied upon his own, and thus we find many tombs either hastily or imperfectly finished, and chambers left in all states of progress. Could a monument of such stupendous size as the great pyramid of Gizeh, have been contemplated as an original plan, to have been finished, or nearly so, in the lifetime of one man? but it is easy to conceive that by perpetual additions during a long reign, such a building may have been completed.

Dr. Lepsius then exhibited a selection of beautifully finished drawings, of the subjects and inscriptions decorating the tombs round the pyramids of Gizeh and Saccara, architectural plans, sections, &c. The time allowed was too short for more than a slight examination of them. The explanations given of some of the subjects was very interesting.

The Doctor did not refer to his researches in the Fayoom. I am, however, enabled to inform you, that he has fixed satisfactorily the place of the labyrinth near the pyramid of Howarra, and has traced from what remains, a general plan of it. Its complete ruin is owing to the walls having been built with rude brick, and merely faced with stone; from the same cause, the tombs at Saccara are nearly all destroyed, while those at Gizeh, which are entirely built of stone, are in good preservation.

By the liberal regulations of the Society at whose rooms this lecture was delivered, strangers are permitted to use the library and attend the lectures, if introduced by a member. I had thus the opportunity of hearing the paper I have endeavoured to report to you. The library, although not very large, contains nearly all the valuable works on the antiquities of Egypt and the surrounding countries, the works of the best travellers and historians, some upon Arabic literature, &c.

Dr. Lepsius left Cairo to-day for Upper Egypt.

OUR WEEKLY GOSSIP.

WE this day close our report of the proceedings, as far as the sectional business is concerned, at the thirteenth meeting of the Association. If success is to be calculated by the number of members attending, it has been a failure, not more, we believe, than 400 having been present; but so many and such obvious circumstances—distance, the political state of the country, &c.—offer themselves in explanation, that the fact cannot excite surprise. It must, however, be regretted, because the resources available for scientific purposes are proportionally reduced; and when the Committee of Recommendations voted no less than 1,877*l.* in aid of further inquiries, it is obvious that the greater part of the money must be taken from the reserved fund, accumulated in past years. It is, however, consolatory to know—and this is admitted on all hands—that so far as science is concerned, the meeting has produced its full proportion of valuable communications; but on this point our

Digitized by Google

readers are able to judge for themselves. To a report of the scientific proceedings we have confined ourselves even more strictly than usual. The hospitable and pleasurable accompaniments of the meeting are matters of moment at the time and to the members, but in no way interest the public, although the speeches of Lord Rosse at the dinner, and of Dr. Robinson at the close of the meeting, were both admirable in their way.

We have so often alluded to the mystery hanging over the fate of Colonel Stoddart and Captain Conolly, that we are sure our readers will learn with pleasure, that a public meeting was held on the 7th, to take into consideration the proposal made by the Rev. J. Wolff of proceeding to Bokhara, to ascertain if the reports of their being still alive are true. At the meeting it was decided that the attempt should be made, and we cannot doubt that sufficient money will be raised at once to pay Mr. Wolff's expenses.

Now that the public have had an opportunity of comparing the cartoons one with another, and pronouncing their opinions on the decision of the judges, the collection has been dispersed, and those who wish to study the successful drawings to greater advantage than they could in the distraction caused by the number of specimens in Westminster Hall, may do so by visiting the Suffolk-street Gallery, where they will be exhibited for the next two or three months on payment of a shilling. The unsuccessful cartoons will, we believe, be exhibited at the Pantheon and the Pantechnicon.

A new machine, called the hydro-electric, invented by Mr. Armstrong, and which is said to be of greater power than any electrical machine before constructed, was exhibited on Thursday evening at the Polytechnic Institution. The experiments performed were very brilliant, and went far to prove the assertion made respecting it. A shaving of wood was ignited by the electric spark, and an immense battery was charged by it in the short space of eleven seconds. The principle on which this machine is constructed is simple. It consists of a common tubular boiler, isolated by means of glass supporters, and a telescope chimney, capable of being lifted off. The steam is let off by means of curved tubes, opening upon a box filled with a row of iron spikes, on which the steam is condensed. The steam, on being let loose, carries away the positive electricity from the boiler, leaving it in a negative state. The equilibrium is then restored to the boiler by means of a conductor brought near to it, and the electric spark is elicited. A novel kind of microscope, invented by Mr. Longbottom, was also exhibited. It reflected the objects upon a white ground, bringing out all the colours most perfectly. Several medallions were exhibited by it, and the effect was tolerably good; but the arrangements, as we understood, were in an imperfect state.

In lack of all other musical novelties, we were led, a day or two since, to examine into the pretensions of a singing mouse, now exhibiting at the Cosmorama Rooms in Regent-street, which we visited, we must confess, rather sceptically inclined. The little vocalist is confined in a common cage such as is used by the Italian boys for their exhibition of white mice. The animal sang incessantly during the whole time we were present—a quarter of an hour: its notes are low but clear, and not unlike those of the nightingale. Every facility is afforded, by the exhibitor, for examining into the genuineness of this musical phenomenon, and with all our care we could detect no appearance of fraud. The fact, if it be one, is especially curious in a zoological point of view, as it is said that the larynx of the mouse is not fitted for the production of musical sounds, and that the present specimen consequently must be somewhat of a *lusus Naturæ*.

The following few words respecting the doings at Cologne are from a correspondent: "Who could pass Cologne, and not look at its cathedral, though for the thousandth time? Now, one looks hopefully: for the choir is rapidly approaching completion:—the frescos and the gilding being three parts finished, and all the splendid windows cleaned: and the nave, and one of the transepts that are to be, show emphatic signs of growth. Whatever the result may be, the church is now a hive of workmen. The Freemasons are said to have bound themselves to lay a yearly offering on the shrine of the Three Kings—a journal is published exclusively devoted to the proceedings of the committee; and those who mark from year to year the awakening in action of this noble and earnest people, as testified in their public works, may be excused for dreaming of a day, when the Gothic Cathedral of the world will stand forth in the fulness of all its glory. Every one is grieving, as well they may, over the destruction of the beautiful Berlin Opera House. Here concerts are flying about as fast as steam can take the artists, Liszt and Haumann, from one town or *Brunnen* to another. It is a relief for a moment, for the Londoner, to be out of the reach of all these temptations—for which reason, I will apply Miss Hardcastle's remark concerning women and music, to these few hasty lines, and they 'shall not be dated.'"

A new work on Goethe has appeared at Dresden, by Dr. Carus, a court physician of that place, entitled 'Contributions to a better Understanding of Goethe.' It has created a stir among the many admirers of the great poet, as containing several unpublished letters, and conversations held by him with the author.—The once-popular German novelist and dramatist, J. Friedrich Kind, died at Dresden, in July, in his 76th year, having been born at Leipzig, March 4, 1768. His productions are so exceedingly numerous, amounting altogether to some fourscore volumes, that nothing but a first-rate reputation could keep the mass of them from sinking into oblivion, especially as they are of a class whose readers require the stimulus of novelty. He was most of all successful in his tales and shorter narratives, which have the recommendation of being of unobjectionable moral tendency. Among his dramatic pieces, his 'Van Dyk's Landleben' is the most esteemed, but 'Der Freischütz' the only one which produced a sensation in the theatrical world, by being "married" to the music of Weber.

The Berlin monument, to commemorate the duration of peace for a quarter of a century in Prussia, of which the first stone was laid three years ago, was uncovered on the 3rd of August last. The shaft is a monolith of granite, twenty-two feet high, standing on a pedestal, with a colossal bronze statue of Victory, by Rauch, on its summit. The capital is Corinthian, with eagles on the side, and the whole monument is fifty-eight feet high.—The new Museum, in the same city, is rapidly advancing towards completion. One large room will be especially devoted to Etrurian art, of which Mr. Waagen has formed a large collection.—An art-romance, called 'Semida, the Original Thinker,' recently published in Berlin, is spoken of very highly, and appears to be exciting much attention.

Alexis Olenin, President of the Academy of Fine Arts at St. Petersburg, died at the end of April, aged upwards of 70.

PRIZE CARTOONS.—Notice is hereby given, that the Prize Cartoons are now removed to the SUFFOLK-STREET GALLERY, Pall Mall East. The Exhibition commenced yesterday, (Friday the 15th). Open daily, from Nine o'clock, A.M., till Six o'clock. Admission, One Shilling.

DIORAMA, REGENT'S PARK.

NOW OPEN, with a NEW EXHIBITION, representing the CATHEDRAL of NOTRE DAME at Paris, with effects of Sunset and Moonlight, painted by M. REMOUX, and the BASILICA of ST. PAUL, near Rome, before and after its destruction by Fire, painted by M. BOUTON. Open from Ten till Six.—N.B. A GRAND MACHINE ORGAN has been constructed expressly for this Exhibition, by Messrs. Gray and Davison, of the New-road, and will perform the Gloria, from Haydn's Service, No. 1, during the midnight effect of the Cathedral of Notre Dame.

RE-OPEN TO THE PUBLIC.

ROYAL POLYTECHNIC INSTITUTION.—FIRST PUBLIC EXHIBITION of Two important Discoveries in Science, viz.—ARMSTRONG'S HYDRO-ELECTRIC MACHINE, which will be exhibited Daily at Three o'Clock, and at Eight in the Evenings; and LONGBOTTOM'S OPAQUE MICROSCOPE, showing Objects in NATURAL HISTORY in all their varied Colours. LECTURES Daily on CHEMISTRY and NATURAL PHILOSOPHY by Dr. Ryan and Prof. Bachoffner. The arrangement of the OPTICAL DEPARTMENT is under the management of Mr. Goddard. DISSOLVING VIEWS and COSMORAMIC PICTURES, MODELS, of all kinds of MACHINERY in MOTION, DIVER and DIVING BELL, &c. Leader of the Band, T. Wallis, Mus. Doc. Open Mornings and Evenings, except Saturday Evenings. Admission 1s.—Schools Half-price.

MISCELLANEA

Paris Academy of Sciences.—Sept. 4.—A communication was received from M. Breguet, announcing that he had completed an apparatus, composed of three mirrors, which cause three successive reflections of the solar light, and are set in motion by a mechanism, which imparts to them the enormous speed of 2,000 revolutions per second. The principal object of this instrument is to verify the hypotheses which have been advanced as to the nature of light, and more particularly the theory of Newton upon its emission, and that of Huygens, Young, and De Fresnel on its undulations.—A work, on the nervous system of men and animals, was received from M. Longet. The author confirms by a variety of experiments the correctness of the opinions of Bell on this interesting, but still imperfectly understood, subject, and throws out many ideas, which may lead to other researches, and to results of more practical utility than any that have yet been obtained as to the precise influence of the nerves on the human body, whether in its normal state or otherwise. One of the facts mentioned by M. Longet is, that the motive force of the nervous system, brought into action by galvanism, is always centrifugal, while the passive or sensitive condition of the nerves takes an opposite direction.—A paper on a remarkable phenomenon of the tides at the Sandwich Islands, on the 7th November, 1837, as recorded by M. T. C. Byde Rooke, was read. On the evening and night of the day above named a commotion of the sea was witnessed at Honolulu, in many respects similar to that experienced at these islands in May, 1819. One inch and a half of rain had fallen during the previous 24 hours; the wind was fresh from the N.E., squally at intervals; the atmosphere was clear and cool, the thermometer 74.5; the barometer had gradually fallen during the four previous days, but this evening had again risen to 30.06. At six o'clock the alarm was given that the sea was retiring; the recession was somewhat more than eight feet; the reefs surrounding the harbour were left dry, and the fish aground were mostly dead; the sea quickly returned, and in twenty-eight minutes reached the height of an ordinary high tide; it then receded, and fell six feet. On the third rising it attained the height of four inches above the high water mark, and fell again 6 feet 4 inches. The rapidity with which the water fell varied in different parts of the harbour; on the east side, the greatest rapidity noticed was six inches in a minute, but on the north, at one time during the third recession, it fell 12 inches in 30 seconds. At no time did the water rise higher than a common spring tide, but the fall was about 6 feet below low water mark. The same occurrence is said to have taken place in 1819, when the tide rose and fell 13 times in the space of a few hours, but on neither occasion was there any perceptible motion or trembling of the earth, or unusual appearance of the atmosphere. The same phenomena were observed at Mani and Hawaii. On the leeward side of Mani, the same rise and fall took place as at Honolulu, but on the windward part of the island the sea retired about 20 fathoms, and quickly returned in one gigantic wave sweeping every thing before it. At a village called Kahulin, district of Wailuku, on the sea retiring the inhabitants followed it, catching the fish, when all at once the sea returned, overwhelming the multitude, but fortunately their amphibious habits diminished the danger, and only two lives were lost; the canoes were, however, all destroyed. At Byron's Bay, Hawaii, the sea at half-past six retired at the rate of 4 or 5 knots an hour, reducing the soundings from 4 to 3½ fathoms at the anchorage, and leaving a great extent of the harbour dry. The inhabitants ran down to the beach, when the same scene took place as at Mani, and had it not been for the assistance afforded by the British whale ship, *Admiral Cockburn*, many lives would have been lost, for the canoes were all destroyed. In Kanokapa and Kaahelu alone 66 houses were destroyed, and 11 persons lost their lives; at Kauwali Swoman no shock of earthquake was felt; but the volcanoes of Kilawa were much disturbed the previous evening; yet nothing unusual was observed at sea at the same distance. That this apparent sub-marine volcanic action took place at some distance from the islands was proved by the waves striking the different islands simultaneously, but in what direction there are no means at present of determining. Perhaps the internal fires had found a new vent, which may lay the foundation of a new group of islands, as happened 19½ years ago.

Uniform Rate of Postage.—We learn from St. Petersburg, Aug. 31, that, on the proposition of the Senate, the Emperor has issued a ukase establishing a uniform postage throughout Russia and the Grand Duchy of Finland, no matter what the distance may be; so that henceforward the tax on letters will vary in charge only according to their weight.—*Galignani.*

THIRTEENTH MEETING OF THE BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

[*From our own Correspondents.*]

TUESDAY, AUGUST 22.

SECTION A.—MATHEMATICAL AND PHYSICAL SCIENCE.

Prof. WHEATSTONE's Report on the Electro-Magnetic Meteorological Register.—The electro-magnetic meteorological register, constructed for the Observatory of the British Association, is nearly complete. It records the indications of the barometer, the thermometer, and the psychrometer every half hour during day and night, and prints the results, in duplicate, on a sheet of paper in figures. It requires no attention for a week, during which time it registers 1,008 observations. Five minutes are sufficient to prepare the machine for another week's work,—that is, to wind up the clock, to furnish the cylinders with fresh sheets of paper, and to recharge the small voltaic element. The range of each instrument is divided into 150 parts; that of the barometer comprises three inches, that of the thermometer includes all degrees of temperature between $-5°$ and $+95°$, and the psychrometer has an equal range. The machine consists essentially of two distinct parts: the first is a regulator clock, to which is attached all the requisite recurring movements; the second is a train, having an independent maintaining power, which is brought into action at irregular periods of time by the contact of the plunging wires with the mercury of the instruments, as will be hereafter explained. The principal regularly recurring actions connected with the clock train are two:—1st. The plungers are gradually and regularly raised in the tubes of the instruments during five minutes, and are allowed to descend during one minute; 2nd. A type wheel, having at its circumference 15 figures, is caused to advance a step every two seconds, while another type wheel, having 12 spokes but only 10 figures, is caused to advance one step when the former completes a revolution. The complete revolution of the second type wheel is effected in six minutes,—that is, in the same time occupied by the ascent and descent of the plungers. Thus every successive division of the range of an instrument corresponds with a different number presented by the two type wheels, the same division always corresponding with the same number. The two blanks of the second type wheel are presented during the return of the plungers, which occupies a minute, and during which time no observation is recorded. The breaking of the contact between the plunger and the mercury in an instrument, obviously takes place at a different position of the type wheels, according as the mercury is at a different elevation; if, therefore, the types be caused to make an impression at this moment, the degree of elevation of the mercury will be recorded. This end is thus effected. One end of a conducting wire is connected with the mercury in the tube of the instrument, and the other end with the brass frame of the clock, which is in metallic communication with the plunger. In the course of this circuit an electro-magnet and a single very small voltaic element are interposed. The electro-magnet is so placed as to act upon a small armature of soft iron connected with the detent of the second movement. So long as the plunger is in the mercury the armature remains attracted, but at the moment the plunger leaves the mercury the attraction ceases, and the release of the detent causes a hammer to strike the types, and impress them by means of black copying paper on the cylinder. The armature subsequently remains unattracted until the plunger descends. Immediately before it reascends, a piece of mechanism, connected with the clock movement, brings the armature into contact with the magnet, which remains there, in consequence of the recompletion of the circuit, until the contact is again broken.

'Report of the Committee, appointed by the Council, to superintend the establishment of Meteorological Observations at the Kew Observatory.'—The limited funds at the disposal of the Committee have not allowed them to carry many of the contemplated objects into effect. The preliminary arrangements have, however, been completed, and a very perfect and efficient apparatus for making observations on the electricity of the atmosphere has been established. The Committee has paid more immediate attention to this subject, on account of its importance in connexion with the system of simultaneous magnetic and meteorological observations now making on various points of the earth's surface, in the recommendation of which the Association has taken so prominent a part. The following is a brief notice of the present arrangements:—The dome in which the equatorial was formerly placed has been converted into the electrical observatory. A circular pedestal, about eight feet in height, is firmly fixed in the middle of the room, and a platform, which is ascended by a few steps, surrounds the pedestal, so that the operator, standing upon it, shall be at a convenient height to adjust and observe the various instruments. At the centre of the pedestal is fixed a strong glass pillar, supporting a vertical copper tube tapering upwards; the length of this conductor is twenty feet, sixteen feet being elevated above the dome in the open air. The lower part of the conductor, within the dome, carries four horizontal branches, placed at right angles to each other; these are for the purpose of bringing into connexion with the conductor the various electro-metrical instruments employed. The electricity of the atmosphere is collected by means of the flame of a lamp, kept constantly alight during night and day, and placed at the upper extremity of the conductor; by this plan, which Volta recommended, much more electricity is collected than by means of a metallic point: the lamp is lowered and elevated when required by means of a cord and pulley contained within the tube. The insulating glass support of the conductor has in its interior a hollow conical space, the base of which opens into the pedestal; beneath this opening is placed a small night lamp, which heats the air within the cone and raises the temperature of the glass pillar. The upper part of the external surface of this pillar is not sufficiently heated to prevent the deposition of moisture, and is therefore, to a certain degree, a conductor; the lower part also conducts slightly, on account of its elevated temperature; but there is a zone between these two parts which insulates perfectly, on account of the temperature of that part of the surface being sufficient to expel all moisture, and yet not sufficient to enable it to conduct. A conductor thus insulated will retain its charge for hours together without sensible diminution. Another peculiarity and advantage of this method of insulation is, that the active parts of all the electrometers are suspended from the conductor, and are, therefore, uniformly charged, depending for their insulation on the warmed glass pillar only, and not, as usual, upon separate insulators, which dissipate the electricity unequally. Since the apparatus has been completed the conductor has remained constantly charged, unless purposely discharged, or during the momentary transition from one electrical state to the other. The electric tensions vary in serene weather between $+3°$ and $+90°$, and the diurnal changes are indicated with great precision. This Report is accompanied by a sectional drawing of the Electrical Observatory, and by a register of observations commenced on July 1, and continued regularly for six weeks. Observations made during the same time with the barometer, pluviometer, thermometer, psychrometer, Daniell's and Saussure's hygrometers, &c. were annexed to the Report.

Prof. LLOYD inquired how the electrometer was deprived of moisture preparatory to observations.—Col. SABINE replied, by heating in the usual manner.—Prof. Lloyd said, that his reason for asking was, that he found heating the electrometer set free a portion of the electricity of the glass, and that hence if precaution were not used a cause deranging the experiments would arise.—Col. Sabine said, that the minute attention paid by Prof. Wheatstone to these matters made him sure that this and every other matter which required attention to insure accuracy, would receive it from him. However, he would apprise him of the fact stated by Prof. Lloyd.

Sir J. W. F. HERSCHEL's Report of the Committee appointed to conduct the co-operation of the British Association in the system of simultaneous Magnetical and Meteorological Observations.—The Report commenced with referring to the proceedings of the Antarctic Expedition. Three seasons, in which the ships have forced their way at different points far within the higher latitudes of the southern hemisphere, have furnished a magnetic survey of these regions equalling, or rather surpassing, both in completeness and accuracy, all those sanguine expectations which led the Association to urge on the Government the prosecution of this great enterprise. The magnetic observations of the Expedition which had been sent home, were in course of publication by the Royal Society. In the last of these contributions to terrestrial magnetism, the important subject of the corrections due to the iron of the ships is fully considered, and by the aid of formulæ, furnished by Mr. Archibald Smith, of Trinity College, Cambridge, and founded on the theory of M. Poisson, delivered in his Memoir of 1838, 'Sur les déviations de la Bousole produites par le fer des Vaisseaux,' the constant co-efficients of their corrections for each ship are investigated. The corrections deduced from these elements are found to agree admirably with the results of experiment, thus affording ground for the fullest confidence in the corrections depending on them, as well as in the theory from which they are derived, and in the general approximation to truth of the hypotheses necessarily made as to the distribution of the iron in the vessels. All the results being tabulated and projected in charts, the inspection of these gives room for the following interesting remarks:—1st. As great discordances are to be looked for, and must frequently be experienced in magnetic surveys conducted on land, as in those at sea, and even greater. In effect, the chief and worst cases of discordance occur in observations made on islands. 2nd. The general form of the curves of higher inclination in the southern hemisphere is much more analogous to that in the northern, than appears in M. Gauss's maps. 3rd. Capt. Ross's observations of intensity lead also to the conclusion of a much closer analogy between the two hemispheres than M. Gauss's maps would appear to indicate. No higher intensity than 2.1 has been anywhere observed. 4th. In examining the observations of declination, particularly those which point out the course of the lines of 0° and 10° east, a more westerly position is indicated than that assigned by M. Gauss for the spot in which all the lines of declination unite. The Report then mentioned that the Government of the United States has assigned funds for a magnetic observatory at Washington, as well as for a further three years' continuance of that already established at Philadelphia. The Bavarian Government also has consented, on the application of the Royal Society, to maintain for an additional three years the observatory at Munich. The first part of the volume of Disturbance Observations has been completed, comprising those made in 1840–41. Col. Sabine has prefaced this volume with a synoptic statement of the general conclusions, which it has been found practicable to deduce from the observations in their actual uncorrected state, of which conclusions the following is a brief outline:—At Toronto the march of the regular diurnal movements in declination does not consist in a simple uninterrupted progress and regress of the needle. Commencing from 2 P.M., its movement is continuous to the eastward till 10 P.M.; it then returns westward (through a comparatively small angle) until 2 A.M., when its eastward movement is resumed and continued till 8 A.M., after which its return is continuous to the west until 2 P.M. This second eastward progression is more decided in summer than in winter, and the total range of diurnal fluctuations is also more considerable. At Van Diemen's Land (a station, it is to be borne in mind, almost antipodal to Toronto,) the course of diurnal oscillation agrees with that above stated in all but one feature—viz. that the hours (in mean time at the station) of easterly movement of the north end of the bar at the one station are those of its westerly movements at the other; that the diurnal range is nearly the same in both, with a similar inequality in its summer and winter amount; a similar alternate progression and recess also prevails, and at the same hours. These are certainly very remarkable features, showing a regular connexion between two stations so remote, carried out into what may be regarded as minute particulars. Falling in, however, with the generally received impression of the universality of the causes (whatever they may be) which produce the periodical fluctuations of the magnetic elements, they can only be regarded as contributions to our knowledge of details. It is otherwise with the results deduced, by a comparison of the observations recorded

Digitized by Google

in this volume, not only at these two stations, but also at St. Helena, with each other, and with those made by M. Kreil at Prague, as respects cases of unusual magnetic disturbance which occur (so far as we can yet perceive) casually, or at least not periodically. Such comparison has enabled us, at length, unequivocally to state it as a general proposition, that the whole magnetic system of our globe is affected, in the majority of cases of great disturbance; for it is found that if a list of days of great disturbance, independently noticed as such, and marked by extra observations on each station, be made out, these lists will be found to coincide in at least a majority of days, and more especially in those days when the recorded disturbance has been greatest. Of twenty-nine principal disturbances recorded in Col. Sabine's synoptic table, some confined to a single day, others running through two or three successive days, and comprehending altogether forty-nine days, by far the greater part are shown to have manifested themselves at Toronto, Van Diemen's Land, and Prague, and fifteen are marked by extra observations at St. Helena. But though it is thus rendered certain that the whole globe is affected in many and great magnetic storms, it is equally shown that the minute identity of particular shocks, which seemed to result from the earlier observations of this nature in Europe, is not in general traceable on anything like so extensive a scale. Not the least interesting part of this volume consists in the notices at Toronto of auroral phenomena accompanying the extraordinary magnetic disturbance; they are many and remarkable, and can hardly fail to throw great light on this branch of the present subject. The difficult subject of the determination of the earth's magnetic force in absolute measure has been subjected to a further investigation by Dr. Lloyd. The difficulty which it presents is of a practical rather than a theoretical nature, and arises from this, that the expression for the tangent of the angle of deflection of one magnet by another involves coefficients, which have to be determined in Gauss's method by observations of deflection at two different distances and by elimination, in which process serious errors are introduced in the result by small errors in the observations. The object of Dr. Lloyd has been to point out a method by which the quantity sought may be obtained without elimination by observations at one distance only, thus both diminishing the trouble of the observation, and increasing the accuracy of the result. This method depends on the assumption of an empirical law in the distribution of free magnetism in a magnetical bar, inferred by Biot from Coulomb's researches. Dr. Lloyd adduces several experiments confirmatory of these results. The Report next mentioned Lieut. Lefroy's intended course of magnetic survey in North America as far north as the Great Slave Lake. He crossed the line of no variation between La Cloche and Sault St. Marie, up to which point little change of dip had been experienced, his course leading nearly along the isoclinal line of 77°. The second series of Sir E. Belcher's observations, determining the magnetic elements of 32 stations (the two series embrace 61 stations) in the Pacific Ocean, the Indian and Chinese Seas, are now printed in the Philosophical Transactions.

Sir J. W. F. Herschel 'On a remarkable Photographic Process, by which dormant pictures are produced, capable of developement by the breath or by keeping in a moist atmosphere.'—If nitrate of silver, specific gravity 1.200, be added to ferro-tartaric acid, specific gravity 1.023, a precipitate falls, which is in great measure redissolved by a gentle heat, leaving a black sediment, which being cleared by subsidence, a liquid of a pale yellow colour is obtained, in which a further addition of the nitrate causes no turbidness. When the total quantity of the nitrated solution added amounts to about half the bulk of the ferro-tartaric acid, it is enough. The liquid so prepared does not alter by keeping in the dark. Spread on paper and exposed *wet* to the sunshine (partly shaded) for a few seconds, no impression seems to have been made, but by degrees, although withdrawn from the action of the light, it developes itself spontaneously, and at length becomes very intense. But if the paper be thoroughly dried in the dark, (in which state it is of a very pale greenish yellow colour), it possesses the singular property of receiving a dormant, or invisible picture; to produce which (if it be, for instance, an engraving that is to be copied,) from thirty seconds to a minute's exposure in the sunshine is requisite. It should not be continued too long, as not only is the ultimate effect less striking, but a picture begins to be *visibly* produced, which darkens spontaneously after it is withdrawn. But if the exposure be discontinued before this effect comes on, an invisible impression is the result, to develope which all that is necessary is to breathe upon it, when it immediately appears, and very speedily acquires an extraordinary intensity and sharpness as if by magic. Instead of the breath, it may be subject to the regulated action of aqueous vapour, by laying it in a blotting-paper book, of which some of the outer leaves on both sides have been damped, or by holding it over warm water. Many preparations, both of silver and gold, possess a similar property in an inferior degree, but none that I have yet met with to anything like the extent of that above described.

'On the Action of two Blue Oils upon Light,' by Sir D. Brewster.—Having lately received, through the kindness of Dr. Gilbert, two remarkable oils of a deep blue colour,—namely, the oil from the *Matricaria chamomilla*, and that from the *Achillea millefolia*, I was desirous of ascertaining the nature of their action upon the solar spectrum. Without entering into details respecting the general action of these oils upon the different coloured portions of the spectrum, I shall confine myself to a slight notice of their specific action, in which they differ from all the various bodies which I have yet examined. Between the two lines A and B of Fraunhofer's Map of the Spectrum there are two groups of lines shown in that map. The *two* oils absorb the light in these portions more powerfully than the portions adjacent to them. No other fluid or solid body on which I have hitherto made experiments acts in a similar manner; but what is very remarkable, the earth's atmosphere exercises a similar action, when the sun's light passes through its greatest thickness at sunrise or sunset.

'Notice of an Experiment on the Ordinary Refraction of Iceland Spar,' by Sir D. Brewster.—Prof. M'Cullagh, of Trinity College, Dublin, in following out a hypothesis respecting light, has been led to a law of double refraction more general than that of Fresnel. One of the results of this law, though not a necessary consequence of Prof. M'Cullagh's theoretical views, was, that in all crystals with one axis of double refraction the ordinary ray was refracted according to a law different from that of Snellius. Instead of the two refractions being regulated by the sphere and spheroid of Huygens, they would be regulated by two ellipsoids touching each other at the extremities of a common diameter coinciding with the axis of the crystal—one ellipsoid differing slightly from a sphere, and the other slightly from a spheroid. Prof. M'Cullagh requested me to ascertain whether or not the *ordinary refraction of Iceland spar* varied at different inclinations to the axis, in the hope of finding such a difference as his theoretical views indicated. In place of doing this, by measuring the ordinary index with two separate prisms, I adopted the plan of cutting two prisms out of the same piece of Iceland spar—one having the refracted ray coincident with, and the other perpendicular to, the axis. These prisms were fastened by cement to a plate of glass, and their second surfaces ground and polished in that state, so that their refracting angles were necessarily equal. When this was done, I refracted the *yellow* homogeneous ray D of Fraunhofer, produced by a candle with a salted wick, and, looking through the refracting edges of both prisms with the same eye at the narrow aperture, I observed the most perfect coincidence between the two refracted images of the sharp line D. This placed it beyond a doubt that the ordinary ray had the same index of refraction in both prisms within the limits of the errors of observation. Prof. M'Cullagh's law, however, may still be true.

Prof. M'Cullagh remarked, that the law referred to by Sir D. Brewster was merely conjectural, and was not a necessary consequence of the principles which he (Mr. M'Cullagh) had adopted. It had been proposed chiefly with the view of accounting for certain remarkable phenomena, observed by Sir D. Brewster, in the reflexion of light from Iceland spar. These phenomena are *unsymmetrical* with respect to the axis of the crystal, and this circumstance induced Prof. M'Cullagh to suppose that there might possibly be a corresponding want of symmetry in the law of refraction. The experiment of Sir D. Brewster, as far as it goes, is against this supposition; and if further experiments should tend the same way (as most probably they will), it will follow that the unsymmetrical effects of reflexion do not arise from any cause which penetrates the interior of the crystal, but only from some peculiar structure of its surface. When the action of the crystal upon light is supposed to be symmetrical round its axis, the general law obtained by Prof. M'Cullagh reduces itself to that of Huygens; and in the case of a biaxal crystal, when the phenomena are supposed to be symmetrical with respect to three rectangular axes, the general law coincides with that of Fresnel.

'On the Barometric Compensation of the Pendulum,' by Dr. Robinson.—At the Manchester Meeting of the Association Prof. Bessel made a communication on the improvement of the astronomical clock, which, with other valuable matter, contained a proposal to compensate for the changes of rate produced by the varying density of the atmosphere. This appears in the Report of the Sectional Proceedings, and also at much greater length in No. 465 of the 'Astronomische Nachrichten.' At the time Prof. Stevelly remarked that I had not merely proposed, but applied this compensation twelve years ago*; and I should not have reverted to it, but that I think my method possesses certain advantages over that proposed by the illustrious astronomer of Königsberg, which entitle it to the preference in practice. It was long believed to be demonstrated, that the rate of a pendulum was influenced by the air's density only as far as it lessened the arc of vibration and diminished its gravity by buoyancy. The researches of Kater on the length of the second-pendulum are all vitiated by this mistake, which was discovered by Bessel during a similar investigation, in which he found, by using balls of different specific gravities, that the received buoyancy correction is too small. As early as 1825, and without any knowledge of what Bessel was doing, I had ascertained the same fact by comparing the rates of my transit clock with the barometric indications; and Col. Sabine gave the final proof of it by swinging the pendulum in a vacuum apparatus in the year 1829. The amount of it is far from inconsiderable; even with the mercurial pendulum of my transit clock, which weighs 21 pounds, and presents a very small surface, it is 0ˢ.36 for an inch change of the barometer. Now the remedy for this is obvious. If we attach a barometer to the pendulum, its fall transfers a cylinder of mercury from a point near the axis of motion to a greater distance from it; the time of vibration may thus be made to increase by the same amount that it decreases in consequence of the diminished density of the air. By placing the clock *in vacuo*, as Bessel proposes, (and as Sir James South has actually done for several years past,) the effect of resistance can be determined exactly, and the *diameter* of tube selected, which will nearly correct it. This is not mere speculation, for I have verified it by trial. The diameter which I selected for my tubes (0.1 inch) is not far from the truth. In the autumn of last year a fall of 1.6 inch produced *no appreciable change of arc*. The temperature, however, was then nearly stationary; but notwithstanding its changes during the interval from that time till my leaving Armagh, the arc has been between 1° 36′ and 1° 39′. Before the tubes were applied, the limits for the same period were 1° 42′ and 1° 51′. The changes in Bessel's own clock, though made by Kessel, a first-rate artist, are still greater, being from 1° 25′ to 1° 39′, an excess owing in part probably to the greater severity of a German winter. From what I have seen of the vacuum apparatus used by Sabine or South, I cannot refrain from expressing a wish that the experiment were tried of mounting a transit clock permanently *in vacuo*: such a clock would have many advantages, besides its exemption from changes of barometric pressure.

The Report of the Committee on Waves was presented by Mr. S. Russell, along with a short account of the Researches with which he had been engaged since the period of the former Report.—He had reduced the whole subject of inquiry into a more systematic and complete form than it had at an earlier period in these inquiries, and had found that the arrangement adopted had the effect of removing

* 'Astronomical Memoirs,' Vol. V., Dependence of Clock's rate on Barometer.

Digitized by Google

many of the seeming contradictions of wave phenomena, by showing that phenomena formerly identified were actually the result of conditions essentially distinct from each other, and that there exist orders of waves heretofore confounded, but now ascertained to differ in their origin, nature, and successive phases of existence. These different orders he had separately examined; he had determined their characteristic properties, and registered their phenomena, and proposed to arrange them in the following system:—

Orders: waves of translation—of oscillation—capillary waves—corpuscular waves. Characters: solitary—gregarious. Species: positive or negative—stationary or progressive. Varieties: free—forced; of which distinctions the instances are: wave of resistance, tide wave, aerial sound wave, stream ripple, wind waves, ocean swell, dentate waves, zephyral waves, water sound-wave.

The phenomena of these different orders had been examined, and in their mode of genesis, their laws of motion, their form, the nature of the forces by which they are transmitted, their duration, and the manner of their final extinction, they were found to differ essentially from each other. These various properties were then illustrated by a few examples. In the first order, the velocity is dependent on depth and height alone; in the second, on length alone, being perfectly independent of depth and height; in the third case it is constant; and constant also in the fourth case. In the first, also, the nature of the motion of each individual particle of water during wave transmission is, that the particle describes a semi-circle or semi-ellipse, and then relapses into repose, all the water particles to the bottom having an equal range of horizontal translation. In the second case there is no permanent translation, but a continuous series of revolutions in a series of complete circles, or rather in a spiral, and these revolutions do not extend to great depths below the surface. In the third case the disturbances of the particles do not extend deeper than the range of the capillary forces, excited by the disturbance of the superficial film on the surface of the liquid. And in the fourth class, the motions of the particles are only made sensible through the organ of hearing.

A paper was read on some Investigations connected with Equations of the Fifth Degree, by Sir W. Hamilton.

Captain LARCOM 'On Contoured Maps.'—It is important that maps constructed by the government should exhibit the levels of the country in the most intelligible manner; showing heights not merely on the tops of hills, but round their sides, and through the valleys which traverse them. Such a system is offered by these contours. They are a series of horizontal lines, at a certain distance asunder, and at a certain height above a fixed datum. The datum most commonly used is the level of the sea, doubtless from the shore line being the limit of the land, and the point at which roads must cease, as well as from an impression that it is itself a level line; and therefore, as the first contour, the most appropriate and natural zero, from which to reckon the others. The Section were aware that it has been a point much discussed, whether the high water, the low water, or the mean state of the tide, offers the most level line. This is a point which it would be out of place to discuss here, but it may be stated that, in order to determine it, as far as Ireland is concerned, a series of lines has been very accurately levelled across the island in various directions, and permanent marks are left in all the towns, and on numerous public buildings; and at the end of each of these lines on the coast, tidal observations have been made every five minutes during two complete lunations. These observations, and the connecting lines of level, are now in process of reduction—the degree of accuracy attained is such that a discrepancy of .2 of an inch is immediately apparent—and from them we may expect many points of interest. The steeper the natural slope of the ground is, the closer together the contours, of course, will be, and the more oblique the road; where, on the contrary, the ground slopes very gently, the contours are farther asunder, and the road may be proportionally more direct. By examining the maps of the Irish Survey, on which contours have been drawn, it will be seen that they tell sad tales of the existing roads, every one of which ascends and descends frequently, instead of keeping on a gradual slope for its whole length. In order to exhibit these lines, it is proposed, instead of adding them to the original copperplate, which has a peculiar value as an official record of boundaries, to make a copy of the plate by the electrotype, for the purpose of receiving these lines. Contour maps were thought of early in the progress of the survey, but means were wanting for their execution; at present, however, the outline survey being complete, and the general map, or map of the surface, being in progress, affords a convenient opportunity, which it is hoped will not be lost.

Dr. ROBINSON inquired of Capt. Larcom whether the process of contouring the maps was proceeding, and how soon he supposed it would be completed for Ireland.—Capt. LARCOM replied, that for the present it had been suspended.—Dr. Robinson observed, that whether he considered the value of this process in relation to the general interests of science, or the most important practical economies of the country at large, he could not but deeply deplore the suspension, temporary though he hoped it would be, of this great national undertaking; and he trusted that, before the British Association closed its present sitting, the most energetic steps would be taken to make such an application to government as would induce them to resume this most valuable work. He begged to inquire from Capt. Larcom, what the expense would probably be.—Capt. Larcom replied, that he should estimate it certainly at less than a farthing an acre.—Dr. Robinson: And the original cost was probably sixpence or eightpence.—Capt. Larcom said, perhaps sevenpence to ninepence.—Dr. Robinson: Then, at a cost of about one thirty-second part of the original expense, this invaluable addition to that splendid work, the Trigonometrical Survey of Ireland, could be accomplished. If it was determined finally to suspend this work, he should say that it was very like what the homely adage characterized as penny wise and pound foolish.

The MARQUIS of NORTHAMPTON communicated a letter from Corporal Moyes, of Her Majesty's 17th regiment, containing observations of the thermometer at Aden, in Arabia, at intervals of two hours, night and day, during the month of June, 1843. His Lordship stated that Corporal Moyes had sent him this communication in consequence of his being an inhabitant of Northampton. It was gratifying to find a person in his humble sphere spontaneously taking an interest in matters of science, and amid his heavy professional duties, and under the enervating influences of that very hot climate, entering upon such a laborious series of observations. The letter also contained an offer to continue these observations if they should be deemed of any value. The Marquis had made an extract, exhibiting the most remarkable data furnished by these observations, which he laid before the Section.—Professor LLOYD said it was a curious coincidence that Aden had been one of the stations selected as proper for placing an observatory at, in connexion with the system of co-operation now at work in various parts of the globe, and that this station had only been abandoned from the difficulty of obtaining observers.—Dr. ROBINSON remarked that there was at that moment in the room, another person of the same rank, Corporal Melrose, whose assistance in many branches connected with the trigonometrical survey was deemed very valuable by Capt. Larcom and the other scientific gentlemen engaged in the survey.

Mr. NOTT 'On Terrestrial Magnetism.'—This paper was in continuation of that on Electricity, read on Saturday. The author denied the existence of magnetic poles. The situation of the points of greatest intensity (commonly called poles) in magnets, he conceived to be merely a result of figure On a globular magnet the maximum intensity is, according to his experiments, situate about 75° from the equatorial zone. He maintained that the earth is a globular magnet, the maximum intensity of which is in lat. 75°, and that the magnetic poles of the earth have never yet been found. Terrestrial magnetism being considered as the effect of electric currents which move on the surface, will be affected by the irregularities of that surface, and hence the anomalies of the earth's magnetism. The author denied the conclusiveness of the arguments used to show that the earth is an oblate spheroid. He asserted that globular magnets, if freely suspended, would, by their mutual attraction, rotate and revolve round each other; and, finally, that the doctrine of gravitation must ultimately give way to that of universal magnetism.

Dr. GREEN read a paper 'On polishing the Specula of Telescopes.'—His process, for which he received the gold medal of the Society of Arts, ten years ago, closely resembles, on a small scale, that which has been adopted and perfected by the Earl of Rosse.

LORD ROSSE expressed his pleasure at finding that Dr. Green had turned his attention to this subject, in which so much remained for trial. The model which had been exhibited had in it all that was required to obtain perfect results; but the most perfect machinery was insufficient, without minute and scrupulous attention to detail in every part of this most delicate process. With respect to its theory, he did not attempt any rigorous developement, but was rather guided by general views; of which the most important is, that in polishing there is a progressive lessening of curvature, the degree of which changes with the lateral motion of the polisher; and that by a proper adjustment of it he had obtained a surface not differing sensibly from the parabolic. It might be described as being in a state of transition, but its character was always the same; and he had found this the case by experiments on mirrors of very different magnitudes, so that he conceived it to be practically established. He hoped Dr. Green would continue his researches, and he offered whatever information he had to any one disposed to engage in the same pursuit.—Dr. ROBINSON remarked on the similarity of Dr. Green's model to Lord Rosse's machinery. In fact they had found in their practice the necessity of satisfying the same conditions, only one important difference being between them. Dr. Green, as all others with whom he was acquainted, had placed the speculum on the polisher. Lord Rosse, by reversing this arrangement, had obtained many important advantages, of which one of the most striking is the power of keeping the mirror at a given temperature. Dr. Robinson feared that it would be impossible to give any rigorous demonstration of the parabolic form obtained by certain proportions of the motions, for it depended, not merely on the amount of rubbing surface, but also on the toughness of the pitch and the elasticity of the polisher and specula, which obviously were called into play when one overhung the other, in a way that could scarcely be brought under analysis. All these results, he feared, must be experimental. In illustration of what Lord Rosse had said respecting the surface being in a state of gradual transition of curvature, he might mention that he had found, by extending the stroke of the second excentric to (if he recollected right) 0.45 of the breadth of the mirror, he had figured the convex speculum of his large Cassegrain (fifteen inches aperture) to be hyperbolic, or at least to be aplanatic, with a sensible improvement of the instrument's performance. The speculum was three inches diameter, and took forty minutes to polish it.

WEDNESDAY.

The Rev. Dr. ROBINSON 'On determining the Index Error of a Circle by reflexion of the wires of its telescope.'—The observations made with an astronomical circle depend on an accurate determination of its index error, for which various methods have been adopted, all more or less limited in applicability or defficient in accuracy. The method proposed in the present notice appears so convenient and accurate, that Dr. R. thought it may be useful to lay before the Section a few details respecting its precision. Illuminate the lines in the focus of the telescope behind, so as to leave the field dark; the rays forming an image of them, emerge parallel from the object glass, and if reflected from a mercury trough back into the telescope, will form an image of the lines, visible along with them. If that of the declination line be made to coincide with it, the optic axis of the telescope is obviously vertical, and the reading of the circle gives the nadir. When Dr. R. found Kater's collimator uncertain, he made an illuminating eye-piece, and essayed this method with tolerable success in 1832, but as the power was but 25, he did not pursue it further than was necessary to obtain a value of his latitude. About three years since his attention was recalled to it by Mr. Henderson, who was using it with great advantage; and he made the

Digitized by Google

necessary alteration in the observing eye-piece (power 250,) to avoid the necessity of changing it when illuminating. He now finds this method much superior to the pole star observation in expedition, not inferior in certainty, and so easily practicable, that he in general determines the index correction at the close of each night's work. From the obvious fact, that the angular movement of the image is *twice* that of the telescope, the precision is double that of a star, independent of the fluttering of the latter. Dr. R. would also call the attention of astronomers to the fact, that in determining the division corrections of a circle, it must be remembered that they are occasionally variable with the position of the instrument, and with its temperature. It will, for instance, occasionally be found that the mean of six microscopes will differ from that of two, or of twelve from four by unequal quantities, when the readings of the index differ 180°; and this throws a suspicion on the usual modes of examining divisions. The difference is far too great to be attributed to the error of observation, and appears to occur in every circle of which a detailed examination has been published. In the Armagh circle, Dr. R. has found a few cases of the effect of temperature. The most prominent is that of the four divisions used for the nadir point, and it is remarkable that if this had not been attended to, he would have found for α Lyræ and α Cygni, parallaxes very nearly equal to those assigned them by Dr. Brinkley, Bishop of Cloyn. These remarks seem to furnish an argument in favour of the use of moderate sized instruments, and the improvement of engine division.

The Rev. T. Knox 'On the Quantity of Rain which falls in the S.W. of Ireland and in Suffolk, with the wind at the several points of the compass.'—The Rev. Prof. Lloyd gave an account of the results of a series of observations, made by the Rev. T. Knox and the Rev. H. Knox, on the relative quantity of rain which falls with different winds in England and Ireland. The instrument employed in these observations was contrived by the Rev. T. Knox, for the purpose of registering the amount of rain which falls at a given place with the wind in different points of the compass. A description of its construction has been given in the Proceedings of the Royal Irish Academy. The present communication contains the results of a series of observations made with two of these instruments, one of which was erected at Toomavara, in the county of Tipperary, and the other at Monk's Eleigh, in Suffolk. The observations embrace a period of one year, and are illustrated with diagrams, which represent the results obtained at the two stations, for the whole year, for each quarter of the year, and for the individual months. The following table gives the results for the entire year, expressed in inches.

	S.	S.W.	W.	N.W.	N.	N.E.	E.	S.E.	Total.
Toomavara.	4.249	12.696	8.150	2.640	3.115	3.078	3.101	3.523	40.552
Monk's Eleigh.	2.674	2.756	1.371	2.392	2.776	2.027	3.092	1.708	21.796

It appears, from this table, that while the total amount of rain which falls in Tipperary is nearly double of that which falls in Suffolk, there is likewise a wide difference between the two stations as to the quantity which falls with different winds. In fact, nearly one third of the whole amount of rain falls at the Irish station during the prevalence of the south-westerly winds; while, at the English station, there is a much nearer approach to equality in the amount of rain borne by different winds. This prevalence of rain with the south-westerly wind is distinctly marked in every season of the year at the Irish station; while, at the English one, each season is characterized by an excess of rain from a different point of the compass, producing a near approach to uniformity in the results of the entire year. It is to be observed, that these results are integral effects. A comparison of them with the times of continuance of the respective winds, gives the *raininess* (if it may be so called) of the several winds.

The President inquired whether, since the wind was known, at several places, to blow periodically from two generally opposite points, and only to change abruptly through the intermediate points, this would not interfere with the continuity of Mr. Knox's curves. —Prof. Lloyd replied that Mr. Airy had noticed such a peculiarity of the wind at Cambridge; but Mr. Knox's mode of marking the quantity of rain that falls would not fail even under these circumstances.

'An Account of an extraordinary Tide at Arbroath,' by Mr. Brown.—The ordinary neap tide at Arbroath rises from eight to nine feet, but on July the 5th, 1843, an extraordinary phenomenon presented itself. The moon was in perihelion at two o'clock, and the evening tide was suddenly raised, at the time of high water, to nine and a half or eleven feet, again sunk for about ten minutes, and was raised again, there being a series of fluxes and refluxes. He could not tell whether the phenomenon commenced with a rising or a depression, nor did he know the horizontal length of the wave. The sea was perfectly calm, but vessels which were entering the port perceived a current stronger than usual. In the evening there was a violent thunder-storm. Persons who had observed the appearance before, accounted for it on the supposition of a storm in the Atlantic from the S.W.

Mr. Hunt called attention to a peculiar condition of the tide on the 5th of July, in the Mount's Bay, Cornwall. The tide had receded for about half an hour, when it was observed to flow again, and continued to do so for about ten minutes, when it again receded. This was three times repeated. It was observed that this took place over an extensive line of coast, from the Land's End to Port Leaven. Particulars of the phenomenon, as observed in several places, were collected at Penzance.

'Remarks on Abnormal Tides,' made by Mr. Thomas, of Falmouth.—These remarks had been made in consequence of seeing, in a Report of the Association, the cause which had been assigned by Mr. Russell for the double tides observed in the Frith of Forth, viz. the interference of the northern and southern tidal waves. It appeared to the writer, that this cannot be the rationale of the phenomena, since they occur in places where no such cause exists, as in Falmouth; besides, he thinks that if this be the cause, it should be observed at Leith, where the meeting waves differ two hours in time, and not merely high up in the Frith. He thinks a difference in velocity at different parts of its course, and the influence of strong winds, sufficient to account for the phenomena.

Mr. Scott Russell said, that these remarks applied to the report of last year, and showed the necessity of those very investigations which had actually been made since that time, and which he had reported to this Section on Saturday. During the past year they had traced the double tide to Leith, and even further down, and it is quite obvious that the report of this year decides the point, though in a different manner from that supposed by the writer. In the case of the Frith of Forth, the cause was fully ascertained. The same effect may, however, arise from a variety of causes: currents, reflected tides, tides arriving by different paths, were all causes that might produce double tides; thus they had observed, in many instances, triple tides in the Forth, which were found to arise from a sudden fresh flood in the river, which filled up the hollow between the two, and made a third. Now, if there be but a single tide the same occurrence of a flood might convert it into a double. Again, wherever a tide enters a harbour by two channels, one of which is longer than the other, we may expect double tides. In inland seas, too, such as the Irish Sea and German Ocean, the tide is reflected from one shore and meets the direct wave near the other, and thus a double wave will be produced. There is one remarkable difference, which excludes the tides of the Frith of Forth from all these categories—it is, that we can demonstrate that *one tide is twelve hours older than the other*, and that the alternation of high and low waves from this cause produce the phenomena, so that by discussing the tides in reference to the astronomical phenomena, we arrive at this conclusion. In reference to the first paper, the appearance at Arbroath was not tidal at all. Similar phenomena had been observed elsewhere, on the coast of Scotland, and in all are described in the same manner. They are now engaging the attention of a distinguished geologist in Scotland, and it is supposed that they are the consequences of the subsidence or elevation of the coast. Others think that they arise from submarine volcanic explosions; and the undulations of the atmosphere, which were observed immediately after, would strengthen this opinion.—Mr. Hopkins had employed the agency of such waves produced by submarine elevations for many geological purposes, in particular to account for the transference of boulders. A submarine explosion would produce a wave of the first order, which they had shown to be a wave of translation, and which in a calm sea would raise and carry a body a considerable distance.—Prof. Lloyd remarked on the importance of the elaborate series of observations which had been made by Mr. Russell; no doubt the great source of double tides is the one alluded to, the entrance of the tide by different channels. These causes had been noticed in very early times. The port of Batsha attracted much notice in the time of Sir Isaac Newton. In it there are two channels, the tide entering in two branches, one of which is sometimes at high water when the other is low; they thus interfere with and annihilate each other's effects; at other times they only alter the effect, and produce double tides. Reflexion of wave from opposite coasts is of exactly a similar nature. Mr. Airy, for the purpose of his mathematical investigation of the laws of tides, had caused a series of observations to be made round the coast of Ireland by the Ordnance Survey every five minutes for several months in the year. The results have thrown great light on the nature of tides: several anomalies have been remarked; in the port of Wexford they had found, instead of two tides in the day, a triple, and sometimes a quadruple, tide. The reason assigned for this by Prof. Airy is, the tide is usually the resultant of the solar and lunar tides, and the place and degree of the component tide depends on the two, and is altered by the elongation of the moon from the sun. In ordinary circumstances they will not interfere, but sometimes solar and lunar tides are so distinct, that they become separately visible, and thus double and triple tides are produced.—Mr. Russell said, that Mr. Whewell and himself at a former meeting had discussed this subject; and he had formed a conjecture that the cause might be that supposed by Mr. Airy, and their first observations had been applied to ascertain whether it were so. If this were the cause, the appearance of the phenomena should depend on the hour angle of the moon; they had found that it did not, but was visible at all stages of the tide, at neap as well as spring; therefore, though this may account for several cases of double tides, particularly by taking into account the dislocation which he had explained, it was not applicable to the Frith of Forth. It appeared of the highest importance to endeavour to trace the course of the undulations which were observed at Arbroath and other places, in order, if possible, to ascertain its cause.

Mr. C. Ward presented a new musical instrument. This peculiar modification of the flute had been placed in the exhibition room during the week, and it was now exhibited to the Section, and seemed to attract much attention. The chief excellency of it appeared to consist in the arrangement and mechanical contrivances connected with the keys.

The President, on closing the Section, briefly addressed it; congratulating it on the number and importance of the communications that had been made to it. He said, that although he had been present at many meetings which had been more numerously attended, he did not think he had been present at any in which the work done had been more instructive or more practically important.

Section C.—Geology and Physical Geography.

Tuesday.

Mr. Murchison exhibited a Relievo Map of England and Wales, coloured geologically under his own direction. He pointed out the accordance between the physical features of the country and the boundaries of particular strata, and stated generally the dependence of geographical contour upon the geological structure of any region and the mechanical forces to which the rocks had been subjected.

Dr. Carpenter read an elaborate paper on the microscopic structure of the shells of various mollusca, of the Echinordemata and Crustacea—which was also read on Monday in Section D. (*ante*, p. 829).

Mr. E. Hall exhibited his Maps and Sections illustrating the geological structure of Derbyshire and the Lancashire Coal Field.

WEDNESDAY.

'On the Geology of Corfu,' by Captain Portlock.—Mr. PHILLIPS read the following extract from a letter dated July 9, 1843:—"The secondary limestone here is remarkable: some of it has strongly the aspect of our Irish hardened chalk, and abounds in flints; but other portions resemble some of the varieties of Irish mountain limestone. Fossils are not abundant; but I have obtained two species of terebratula from the little fortified island of Ordo, close to us, and they appear to resemble cretaceous species,—certainly not mountain limestone,—though Dr. Davy in his description of these islands seems to consider it the latter. By the autumn I hope to settle this question completely, which will decide the age also of a remarkable conglomerate, containing pebbles of the limestone and flint, and probably tertiary, though called secondary by Dr. Davy."

Prof. E. FORBES exhibited a 'Map of Lycia,' by Lieut. Spratt.

Major L. BEAMISH, F.R.S., read a paper 'On the apparent fall or diminution of Water in the Baltic, and elevation of the Scandinavian Coast.'—During a journey to Stockholm in the early part of the present summer, the author had occasion to see and hear much respecting the diminution of water in the Baltic, a practical and personal evidence of which he experienced in the harbour of Travemunde, on the 4th of May, by the sudden fall of water at the port, which took place very rapidly, and to a great extent. The steamer, which ought to have left Travemunde on the 18th, was detained by this cause until the 21st. It is well known, that although without tide, the Baltic is subject to periodical variations of depth, but the water has fallen during the present summer, to a degree far below these ordinary variations: and the fact was considered so remarkable as to be thought worthy of being brought before the notice of the Swedish Academy of Sciences, by Baron Berzelius, in July last. This fall or diminution of water was already perceptible in the summer of 1842, since which, the Baltic has never returned to its average mean height: but, on the contrary, has diminished, and there seems now no probability that the former level, or the height of 1841, will be again attained. Meantime, no perceptible change has taken place in the waters of the North Sea, and the unscientific observer asks, what has become of the waters of the Baltic? The answer is probably to be found in a simultaneous phenomenon apparent on the Swedish coast, the gradual elevation of which has been satisfactorily proved by the personal observation of Mr. Lyell. Recent observation, however, would seem to show, that this elevation does not proceed at any regular or fixed rate, but, if he might use the expression, *fitfully*, at uncertain periods, and at a rate far greater than was at first supposed. At the same meeting, when Baron Berzelius drew the attention of the Swedish Academy to the diminution of water in the Baltic, a communication was made from an officer who had been employed on the south-west coast of Sweden, in the Skärgård of Bohuslän, north of Gottenburg, giving evidence of the recent elevation of that part of the coast, and stating, that during the present summer, fishermen had pointed out to him, near the Maloström, at Oroust, *shoals* which had never before been visible. The elevation of the Swedish coast forms a striking contrast with the unchanged position of the contiguous coast of Norway, which, as far as observation has been hitherto extended, has suffered no change within the period of history, although marine deposits, found upon the Norwegian hills, at very considerable elevations above the level of the sea, prove that those parts were formerly submerged. More accurate information, however, will, before long, be obtained on this interesting point, as a commission has been appointed by the Norwegian government to investigate the subject, and marks have been set up on the coast, which will, in a few years, afford the desired information; meantime, the Scandinavian peninsula presents an extraordinary phenomenon; the western, or Norwegian side, remaining stationary, while the south and east, or Swedish sides, are rising, and that, as the author had endeavoured to show, at no inconsiderable rate.

Dr. LANGBERG, of Christiania, confirmed the statement made by Major Beamish, as to the unchanged position of the Norwegian coast, within the period of history, as far as observation has hitherto gone, as also the steps taken at the instigation of Prof. Kailow, and the Physiographical Society of Christiania, to investigate the subject with greater accuracy.—Mr. LYELL observed, that if the rate of upward and downward movement of the land in Scandinavia could be proved to take place irregularly, and sometimes with considerable rapidity in a short time, it would remove many difficulties in the explanation of these phenomena, by the hypothesis of a surface-movement. He then alluded to the buried hut (described by him in the *Phil. Trans.*) at Södertelge, near Stockholm, above which regular deposits, 24 feet in thickness, were found, containing marine and fresh-water shells, such as now inhabit the brackish waters of the Baltic. The position of this hut can only be reconciled with the belief that Scandinavia was peopled within the last 5000 or 6000 years, by supposing a greater rate of movement in the land than that experienced within the last few centuries near Stockholm.—Mr. HOPKINS remarked, that changes in the relative level of sea and land might be due either to uncertain and convulsive movements, such as earthquakes, or to some steady cause, such as a change in the temperature of the globe. He considered the external temperature must have been much lower during the glacial period than at the present time; and this difference was too important to be accounted for by any change in the configuration of the surface. Any great change of temperature at the surface would also affect the interior to some point, not very remote, but sufficient, in case of any subsequent augmentation of temperature, to cause an expansion and elevation of the surface, varying according to the conductive power of the rocks in different parts.

The Secretary, Mr. F. JENNINGS, read a paper 'On some Geological Phenomena in the vicinity of Cork.'—On many parts of the coasts of the counties of Cork and Waterford, there are evident proofs of the land having subsided, peat and bog-wood being dug out of the strands at the edge of the water during ebb-tide—and every storm washing large trunks of trees on the beach which, in some places, are visible *in situ* below the lowest water of low tides, the oak, hazel, and birch, being the most abundant.

'On the occurrence of a Bed of Sand, containing recent Marine Shells, on the summit of a granite hill, on the coast of the county of Mayo.'—Mr. GRIFFITH described the peninsula, called the Mullet of Erris, which is situated W. of Blacksod Harbour, on the N.W. coast of Mayo.—The northern part presents some hills of mica slate and quartz rock, of moderate elevation, the most important being Aughalasheen, 434 feet high. The central part of the peninsula is low and uninteresting, the principal elevation not exceeding 120 feet, the general level varying from 20 to 60 above the level of the sea. At the southern extremity is Termon Hill, the summit of which is 342 feet above the level of the sea. The walls of this peninsula are quartzite, mica slate, metamorphic slate passing into gneiss, hornblende slate, and granite. The quartzite occurs at the northern extremity, and forms the conical hill of Aughalasheen. The principal tract of mica slate lies to the N. and W. of Belmullet, to the S. of which it exhibits a highly crystalline and metamorphic structure; and the strata present alternations of gneiss, with large crystals of feldspar; the beds are not thick, but frequently present a tortuous arrangement. The metamorphic strata extend southward from Belmullet, to the S. of Elly Bay, a distance of seven miles, where mica slate again commences, and extends to the base of Termon Hill, which is composed of highly crystalline grey granite, arranged in very large tabular masses, which affect a nearly horizontal position. Some of the masses assume a rhomboidal form, but neither in the external aspect nor in the internal structure do they exhibit appearances of a stratiform arrangement. In fact they are precisely similar to the tabular granite of Slieve Donard and other granite mountains in the county of Down. On the shore at Port Glash, at the north-western base of Termon Hill, there is a very fine junction of the granite, with the metamorphic mica slate. The division of the two rocks is quite clear, and well defined, without the least appearance of gradation. In some places, the two rocks do not adhere, the slaty rock being slightly disintegrated near the contact. In others, angular fragments of the schistose rock are enveloped in the granite. There are only a few small granite veins penetrating the slate, which are composed of feldspar, quartz, and mica, with interspersed garnets, which are abundant where the veins become narrow, near their termination. To the S.W. of the junction the schistose rock forms a narrow band between the granite and the sea. A considerable portion of the surface of the Mullet is covered with sand; it is white and siliceous, and contains at its base a great number of marine shells. The varieties are—*Purpura lapillus, Turbo rudis, Patella vulgaris, Cardium edule, Littorina littorea, Ostrea edulis, Pecten varians.* On the W. coast of the centre of the peninsula, N. and S. of Elly Bay, the surface of the country is covered by this sand, which forms considerable hills, varying from fifty to eighty feet high, the whole being formed of sand without any admixture of mud. The marine shells are most abundant in this mass towards the base. In those positions where the sand has been blown away so as to form valleys among the sand hills, the surface is thickly strewed with both marine and land shells, so as to give the appearance of being thus intermixed; but this is not really the case, as on carefully examining the sections of the sand, no land shells were found, though the marine, particularly the *Patella vulgaris*, were abundant; so that we must consider the land shells as merely superficial, and that the animals lived among the tufts of *Arundo arenaria*, with which the greater part of the surface is covered. The sand is not confined to the low ground: a bed of it, from six to ten feet thick, occurs on the sides and top of the hill of Termon, as high up as about 300 feet above the level of the sea. This sand bed contains in abundance all the marine shells already enumerated, together with land shells, the same as the sand on the low ground. This elevated sand bed also presents valleys in those parts where the sand has been blown away by winds, and sometimes the bare granite rock is exposed, but thinly covered by the shells, after the sand was blown away. Hence we must conclude that this sand, with its marine shells, once formed the bed of the ocean, and that the whole mountain, with its bed of sand on its surface, has been elevated to its present position by the protrusion of the granite; and if this be admitted, it becomes evident that the granite must have been elevated within the period of the recent shells.

Mr. NEVINS mentioned the occurrence of a submarine forest at the mouth of a small stream in Tramore Bay, showing a recent change of level in a direction contrary to that indicated by the raised beaches.—Mr. PHILLIPS also mentioned evidences of local elevation and depression, occurring in the space of one mile, on the eastern coast of Yorkshire, from which he inferred that the movement had not been uniform, but oscillating.—Mr. LYELL stated, that he believed the complicated evidence of changes of level during the latest geological periods, both in Europe and America, would be better accounted for by changes of climate, arising from a different geographical distribution of land and water, than by the hypothesis of central heat, or by the supposed passage of the solar system through planetary spaces of differing temperature. If the whole of Europe had been at any time submerged, other tracts now beneath the sea must have been elevated, and a change of temperature might have been produced similar to that which still obtains in the southern ocean.—Mr. HOPKINS observed, that the difference in the elevation of raised beaches in different parts of Ireland did not prove an unequal elevation of the land; the beds of oysters, &c. might have originally occupied different depths in the sea; and the beaches might have been formed at different periods. He did not think that any change in the distribution of land and water would account for the depression of temperature during the glacial period. The Andes were the chief cause of the low temperature prevailing along the eastern coast of South America; and such mountains could not have existed in Europe, since the level of the land had been proved to be lower; and if the whole of Europe were submerged, he thought the temperature of the region would rather be raised than depressed. With respect to Poisson's hypothesis, he stated that such a movement of the solar system was much more consistent with analogy than the usual assumption of its rest; and it was the only hypothesis which would account for geological

Digitized by Google

changes of such an order and magnitude as those under consideration.

Section D.—ZOOLOGY AND BOTANY.

TUESDAY.

Prof. Owen read a continuation of his Report on the Fossil Mammalia of Great Britain.—In the previous parts of the Report he had treated of the Carnivora and Marsupiata: in this he confined himself to an examination of the vegetable-feeders. Remains of the mammoth, of which he believed there was only one species, the *Elephas primogenitus* of Cuvier, had been found in abundance in various parts of Great Britain, and not less than three thousand teeth had been found in various places. These teeth varied in appearance with age, and had thus led to the supposition that there were other species of mammoth. The remains of the mastodon found in Suffolk and Yorkshire, were undoubtedly identical with those of the miocene beds of France, thus making but one European species, the *Mastodon angustidens*. Bones of an extinct species of rhinoceros had been found in various parts of Great Britain. It possessed two horns, and was undoubtedly different from existing species. The teeth also of a species of hippopotamus had often been found, as in the cave at Kirkdale and other limestone rocks. In the Isle of Wight two distinct genera of pachyderms had been found; the Palæotherium and Anoplotherium. Of the former genus, there appears to have been six or seven species, and of the latter three. The teeth and fragments of bones of more uncommon forms still, had been found in the Isle of Wight and in Suffolk, which had been referred to animals of distinct genera, and called Chæropotamus and Hyracotherium. Remains of species of the genus Sus, had also been found by Dr. Buckland. Of the Ruminantia, the Irish elk as it had been called, has been also found in England. In structure this animal resembled the fallow deer, but was larger. The remains of a cervus, not differing from the red-deer, were frequently found with the mammoth and other animals. Remains also of the roebuck, and the goat and sheep, had been found associated with those of the mammoth. Remains of the aurochs, or European bison, had been found in various parts of England, and also of Ireland. According to Mr. Ball, these remains should be looked upon as those of an extinct species. In concluding his Report, Prof. Owen stated, that he never should have commenced these labours, nor could he have continued them, but for the suggestions and assistance of the British Association.

Mr. H. E. Strickland then read a description of a 'Chart of the Natural Affinities of the Insessorial Order of Birds.'—At the Glasgow meeting, in 1840, Mr. Strickland had first proposed his plan for exhibiting the affinities of allied organic forms, by a process analogous, in some respects, to that of map-making. He now exhibited a large chart constructed on this plan, and showing the affinities of the genera in the order Insessores. The name of each genus is inscribed in an oval cartouche, and its affinities to other genera are indicated by connecting lines, the lengths of which lines are approximately proportionate to the remoteness of the affinities. Those genera which are most nearly allied are connected by a line of *one* degree, or unit, in length; and those less closely allied, by a line of *two* degrees. Genera so distant as to require to be placed in different *sub-families*, are united by lines of three or four degrees; those in different *families* by lines of five or six degrees; and those in different *tribes* by lines of seven or eight degrees. A line is drawn round those genera which constitute one sub-family, and the area thus inclosed is coloured, the surrounding space being left white. The sub-families which belong to the same family, are distinguished by the same colour; and the families are inclosed within a dotted line; while the boundaries of the tribes are marked by a red stripe. The names of the respective groups are inserted; and the whole assumes the appearance of a cluster of islands depicted on a map. The author expressed his belief that the true affinities of organized beings may be expressed with greater accuracy and conciseness by this method than by any other with which he was acquainted. Being a purely inductive process, the details of any branch of natural history may be in this way worked out and depicted without recourse to any theoretical assumptions. One result of it seems to be, that the true affinities of organic structures branch out irregularly in all directions, and that no symmetrical arrangement or numerical uniformity is discoverable in the system of nature when studied independently of preconceived theory.

Prof. Forbes thought Mr. Strickland's map a good one, and might prove useful; but as a system of classification, it wanted principles to proceed upon.—Prof. Owen approved of Mr. Strickland's smaller groups, and hoped he would prosecute his researches on this subject. Every part of every animal must be known before we could have a perfect system. Pallas had given an idea of the animal kingdom, by supposing it a network drawn up in the form of a cone, of which man formed the apex. He was disposed to adopt this view, supposing also that there were other lower points of the net, in which an organization was completed which did not appear in man. He rejected altogether quinary, circular, and other systems.—Dr. Lankester stated, that there were two objects in classification, the one that of arranging objects so that they might be easily examined and identified, and the second, that of placing nearest to each other objects which were most alike. The endeavour to embrace these two ends in one system had been the cause of all the differences among systematists. He thought Mr. Strickland's remarks too severe on artificial systems, as these must always be of great use when properly applied, and only to be condemned when assuming to occupy the position of a natural arrangement.—Mr. Ball condemned the quinary system and approved of Mr. Strickland's mode of arriving at his conclusions.

Dr. Allman read a paper 'On the genus *Cirropteron*, Sars.'—In this communication it was maintained, that the genus Cirropteron had no real existence, having been founded by Sars on the imperfectly developed condition of a gasteropodous mollusc. Dr. Allman had himself bred from the ova of a gasteropodous mollusc animals referable to Sars' genus; and the singular ciliated disks with which the larvæ of buccinum, trochus, &c. are furnished, have been noticed by other observers. Dr. Allman called attention to the remarkable analogy which exists between these molluscan larvæ and the Rotiferæ, and advocated the necessity to the zoologist of an accurate knowledge, not only of the anatomy of the various organized beings which come under his observation, but of their history during the entire period of their existence.

WEDNESDAY.

Dr. Allman read a paper 'On certain Peculiarities in the Arteries of the Six-banded Armadillo.'—The peculiarities noticed in this communication consist in a remarkable arrangement of vessels analogous to what has been already observed in the sloths, in the two-toed ant-eater, and in the lorises, and is characterized by the arteries having a tendency to *divide* rather than ramify, from which it results, that instead of a diffusely branched arterial distribution, the larger branches suddenly break themselves up into a number of small vessels, which anastomosing but sparingly, give rise to a series of vascular pencils, from which the ultimate supply of blood to the organs is derived. This remarkable arrangement is chiefly displayed in the arteries of the posterior extremities, in the caudal and in the epigastric arteries.

Prof. Owen observed, that this structure in the armadillo was not like that in the Cetacea, which was used as a reservoir of blood for those animals when under water. This was a valuable addition to our knowledge of the comparative anatomy of mammalia.—Mr. Ball observed, that this arrangement had been supposed to be peculiar to slow-moving animals, but the armadillo was a very quick-moving creature.

Dr. Allman then read a 'Synopsis of the Genera and Species of Zoophytes inhabiting the fresh waters of Ireland.'—The fresh-water Zoophytes of Great Britain have hitherto been all included under the following four genera, Hydra, Cristatella, Alcyonella, and Plumatella. Of these, Hydra is made to include four British species,—Cristatella one, Alcyonella one, and Plumatella has been described as containing three species. Of the above nine species, the author was of opinion that two must be erased, viz., the *Hydra verucosa* of Templeton, which appears identical with *H. fusca*, and the *Plumatella gelatinosa* of Flemming, which is evidently the same with Blumenbach's *Tubularia sultana*. To the seven species which remain, Dr. Allman was enabled to add five, of which four do not appear to have been before noticed' and the other is only found described in the Fauna of the Continent. The zoophytes at present included under Plumatella were distributed in the synopsis between two genera,—those with crescentic disks being retained under Plumatella, while those whose disks are circular were removed to Fredericella, a genus established by M. Gervais for this form of ascidian zoophyte. An important addition now made to the British zoophytes is Paludicella, discovered by W. Thompson, Esq. at Lough Erne, in the autumn of 1837, and since obtained abundantly by Dr. Allman in the Grand Canal near Dublin. In October, 1842, a hydroid zoophyte of much interest was discovered by Dr. Allman in the Grand Canal, Dublin; it is referable to no known genus, and occupies a position between Coryne and Hermia. For the reception of this zoophyte, therefore, he has been obliged to form a new genus, to which he has given the name Cordylophora. The synopsis, therefore, embraced several new species and two genera, now for the first time added to the British Fauna.

Prof. Forbes remarked on the value of this paper. In Fredericella we had the analogue of the marine genus Coryne, as we had in Hydra, that of Sertularia. This paper pointed out the impossibility of the existence of such a genus as Hassell's Echinochorium.

Dr. Allman read a paper 'On a new Genus of Terrestrial Gasteropod.'—This highly interesting animal was found last autumn in the county of Derry by Mr. Andrews, of Dublin. Dr. Allman examined it, and convinced himself of its entire generic distinctness and importance. It constitutes a connecting link between Arion and Limax, differing from the former in the possession of a well-developed internal shell, and in the position of the genital pore, which is placed, as in Limax, behind the root of the right small tentacle; and from the latter, in the orifice to the respiratory sac being in the anterior margin of the shield, and in its truncated glanduliferous tail. To the new genus, which it was therefore necessary to constitute for the reception of the gasteropod, Dr. Allman gave the name Geomalacus; and to the present species, the only one of the genus as yet discovered, the specific name maculosus is appropriated.

Mr. Babington presented three new additions to the Flora of Cork. They consisted, first, of *Erica Mackayii*, which had been previously found only in Connemara; second, the *Erica cilians;* and third, the *Dabœcia multifolia*.

Dr. Lankester exhibited specimens of the *Calothrix nivea*, and also of the red deposit formed by a species of animalcule belonging to the genus Astasia, and which he had previously described as inhabiting sulphureous waters. These specimens he had found on the shore near Cove, in a cavity of the limestone rock. The water in which they were found was highly impregnated with sulphuretted hydrogen. It did not appear to arise from any spring, and the gas was probably produced by the decomposition of the sulphates of the sea-water, in contact with the decomposing vegetable matter, in the cavity where it was found.

Mr. Hunt had observed living animalcules in waters impregnated with sulphuretted hydrogen. He had also succeeded in forming sulphuretted hydrogen by placing sulphates in contact with decomposing vegetable matter.

The Rev. W. Hincks read a communication from Dr. Wood, 'On the economical Uses of certain Lichens.'—The object of this paper was to draw attention to the fact that the *Lecanora tartarea* and *parcelea* grew in abundance about Cork, and that the collecting of these lichens as dyes might become a source of employment for the poor. Specimens of the plants were then exhibited.

Mr. Hincks exhibited the volumes of Sowerby's Fungi, which had been in the possession of the late Mr. Templeton, and which contained many valuable manuscript remarks.

Mr. Patterson stated that Mr. Templeton might be regarded as the father of natural history in Ireland. Dr. Drummond was his pupil, and to Dr. Drummond they were indebted for the Natural History Society of Belfast.

The Secretary read a paper from Mr. Waterhouse, of London, 'On the Classification of Mammalia.'—In this paper the author proposed a new arrangement, differing considerably from that of previous authors.

Digitized by Google

The paper was illustrated by several diagrams exhibiting the relation of the families and genera.

Prof. FORBES exhibited specimens of animals which had been dredged up on the coast of Ireland by Mr. Hoskins. He then read a communication from Mr. Alder, describing a new species of mollusc found at Dalkey Island, near Dublin, having a shell in all respects similar to that of the genus Rissoa, from which, nevertheless, the animal differs materially. The most striking peculiarities were the presence of four tentacula, and the position of the eyes, which are placed on the back, at some distance behind the tentacula, and not at their base, as in Rissoa and the allied genera.

Prof. Forbes also read a paper by Messrs. J. Alder and A. Hancock, 'On some new Species of *Mollusca nudibranchiata*, with Observations on the Structure and Developement of the Animals of that order.'—The species described were a beautiful Calliopœa, the first discovered in Britain, and four new species of Eolis. The authors then gave an account of their observations on the developement of the ova in that order, stating the remarkable fact of these animals undergoing a complete metamorphosis, and being, in their first or larva state, furnished with a nautiloid shell, which afterwards entirely disappears. They next alluded to some interesting anatomical peculiarities, describing the gastro-vascular system in Eolis, and the ejection occasionally of some curious bodies from the ends of the papillæ, apparently connected with this system. The organs of the external senses were next remarked upon, and the existence of organs of hearing in this class of gasteropodes for the first time pointed out. They consist of small capsules filled with very minute concretions, which, in the living animal, are in a continued state of oscillation. Several reasons were also adduced for supposing that the dorsal tentacula of these animals are the true organs of smelling. The whole was illustrated by a series of drawings by Mr. Hancock.

Mr. THOMPSON observed that these researches had doubled our knowledge of the number of species of Nudibranchiata Mollusca.—Prof. OWEN said these papers cleared up the difficulty that had hitherto been experienced with regard to the developement of the Nudibranchiata Mollusca. Many of the young of these animals had been described and figured as belonging to very different genera and species. Their whole structure was now made out by the researches of Messrs. Alder and Hancock.

Mr. THOMPSON called attention to the circumstance of the nidification of the Woodcock in Ireland, with especial reference to Tullamore Park, in the county of Down, the seat of the Earl of Roden. Here the species was first observed to remain throughout the summer, and rear its young, in 1835, since which period the numbers so remaining have been gradually on the increase; and in the present year twenty-two nests have been found, so that now woodcocks are as plentiful in summer as in winter in the park.

Mr. THOMPSON noticed some additions to the Fauna of Ireland, comprising altogether, in the various classes (excepting Insecta, Entozoa, and Infusoria), about sixty species.

Mr. THOMPSON read his report 'On certain portions of the Invertebrate Fauna of Ireland,' drawn up at the request of the Association. It contains ample catalogues of the Irish species of Mollusca, Cirrhipoda, Echinodermata, Acalepha, Zoophyta, Annelida, Crustacea, &c.; together with a comparative view of the Irish and British species; and a notice of the distribution of the former over the island or around the coast.

Prof. FORBES remarked that Mr. Thompson's report on the Fauna of Ireland was one of the most complete that had hitherto appeared in the English language. He hoped that Mr. Thompson would yet comprise in his report the insects and infusoria.

Thanks having been voted to the President and Vice-Presidents, the Section adjourned.

SECTION E.—MEDICAL SCIENCE.

MONDAY.

Sir James Pitcairn in the chair.—The Secretary laid before the Section a Meteorological Table from Mr. Prichard, of Beddgelert, in which were detailed the mean results of observations made in that locality, during the year commencing July, 1842.

Dr. HOUSTON read a paper 'On the Circulation of the Blood in Acardiac Fœtuses.'—Dr. Young, Sir Astley Cooper, and Dr. Marshall Hall, held the opinion that the circulation in an acardiac fœtus was maintained by the action of the heart of the perfect fœtus which accompanies it in utero, but this opinion was disproved by the fact that such were not always found in twin cases, but occurred singly, as was proved by Blandin and others; but even omitting such cases, Dr. H. argued, from theoretical principles, that the efficient cause of the circulation must be the innate vital action of the capillaries; the existence of such a power, he contended, was shown in several instances in comparative anatomy: in the earth-worm, the leech, and in the rudimentary vessels of the chick in ovo. This was the power recognized by Alison under the term "vital attraction and repulsion."

Dr. POPHAM read a paper 'On the treatment of Gangrene of the Lung by Chloride of Lime.'—The author stated that the rarity of the occurrence of gangrene of the lung after idiopathic pneumonia induced him to lay the details of a case successfully treated by chloride of lime before the Section; he detailed cases which had proved fatal, and which, on *post mortem* examination, were proved to be gangrene of the lung, and the symptoms of the successful case were perfectly analogous; there existed the sudden exhaustion, with the haggard collapsed countenance, the expectoration of quantities of thin fœtid sanious matter, and the intense fœtor of breath, setting in suddenly after a protracted case of pneumonia. The case appeared rapidly hastening to a fatal termination when the chloride of lime was exhibited, and the improvement was immediate. The fœtor of the breath and expectoration were corrected, the strength improved, and the patient finally recovered; on a relapse occurring, the same remedy was successfully resorted to.

Dr. SARGENT inquired the doses that were used, and if any other remedies were exhibited at the same time.—Dr. Popham replied, that he gave the concentrated solution of Labarraque in mixture of six ounces, containing six drams of the solution, which was given in the course of twenty-four hours—that he gave at the same time, wine, opium, and generous diet.—Dr. Sargent deemed the diagnosis to have been fairly established from the symptoms, and that the case was an important confirmation of the value of the remedy used, but that it was not a new one.—Dr. WALL was aware of the value of chloride of lime as a local remedy, but could not conceive how it was applicable in internal gangrene.—Dr. O'CONNOR observed, that it had the power of acting as a general stimulant where there was a tendency to constitutional sinking: it was this property which made it valuable in collapse in low fever.

Dr. OLLIFFE, of Paris, read a paper 'On Intestinal Obstructions.'—The author's object was to lay before the Association the principle, mode of performance, and results, of Amussat's operation for artificial anus, and to advocate its adoption from the experience he had of its success in cases which must necessarily have proved fatal if it had not been performed. Dr. O. gave the details of eight cases, in many of which he had assisted; of those, four had proved successful; three are still living, one of them a child two years old, in whom the operation was performed twenty-four hours after birth, being rendered necessary by an organic defect.

A MEMBER condemned the operation, not only for its partial fatality, but also from the sufferings of a patient who had survived it for three years, whom he had seen at Rouen.

The Secretary read an abstract of a paper by Mr. I. Erichsen, 'On the Cause of Death after the introduction of Air into the Veins.'—The theories of former physiologists were alluded to and disproved by a series of original experiments; the principal of these theories were that of Bichat, who supposed death to be occasioned by distension and irritation of the vessels of the brain, causing fatal congestion in that organ, and that of Dupuytren and Bouillaud, who supposed that the circulation was arrested by distension, and consequent paralysis of the heart. After disproving these opinions by experiment, the author arrives at what he conceives the true pathology, which he sums up in the following conclusions: first, that the primary arrest of the circulation takes place in the capillaries of the lungs, in consequence of inability of the right ventricle of the heart to overcome the mechanical obstacle presented by the air bubbles in these organs; second, that respiration and animal life cease from want of a supply of arterial blood in the central organ of the nervous system. In conclusion, the author made suggestions for preventing the occurrence in operations, and for averting a fatal termination when it had partially taken place: for the former purpose he advised suppression of the respiration as much as possible, by bandaging the abdomen and thorax; and as remedies to be adopted on its occurrence, he recommended pressure on the principal veins leading from the wound, insufflation of the lungs, and stimulants to increase the heart's action.

TUESDAY.

Mr. CRONIN read a paper 'On the Statistical Results of Amputation.'—The peculiarities of about twenty cases, with the results and brief observations, were communicated from a Report drawn up in a tabular form. He said he brought the subject forward from the desire which now exists to have uniformity in the mode of keeping hospital reports, and the results of such reports, he believed, would be much more valuable, if exhibited in a uniformly constructed table; as a specimen of such a table he communicated his cases.

Dr. O'CONNOR detailed the particulars of a remarkable case, in which the hair was entirely lost from the effects of extreme terror; a healthy boy, twelve years of age, awoke screaming from the vivid impression made on his mind by a dream, in which he thought he was about being murdered; the next day his hair began to fall off, and in a fortnight he was quite bald, and he continues so, though several years have elapsed. Dr. O'Connor observed, that although the opinion exists among physiologists, that depressing passions, such as grief or terror, may turn the hair grey, or cause it to fall off, yet well authenticated cases of such phenomena are very rare; for this reason he deemed it right to lay this case, which came under his own observation, before the Section.

Dr. BEVAN read a paper 'On the Tests for Arsenic,' in which he pointed out the difficulties and unsatisfactory results in the modes of detecting that poison hitherto used in medico-legal investigations; even Marsh's test, he said, failed in giving a quantitive result. In conclusion, he proposed a new method of testing, which, he said, had the advantage of extreme simplicity in its manipulation, and certainty in its result. Into a narrow glass bottle he introduced dilute nitric acid (1 part acid to 4 of water) until it was half full; into this he introduced a clean copper rod, and on the surface of the acid he poured melted tallow, which, when concrete, formed a diaphragm between the immersed and free portions of the rod. On this diaphragm he poured the solution of arsenic, and within six hours metallic arsenic was deposited on the upper portion of the rod; this test will detect the $\frac{1}{100}$th of a grain. A zinc rod will give the result more rapidly.

Dr. WHERLAND detailed the particulars of a rare case of Midwifery, which was deemed by the Section perfectly unique, no similar one existing in the records of practice.

The SECRETARY read a Report by Mr. James Blake, 'On the Physiological Action of Medicines.'—This was an account of a very few experiments instituted by the author in the progress of his researches on the general subject of his inquiry. After alluding to his former publication on the effects of medicinal agents injected into the veins, he detailed a few experiments instituted to ascertain how far chemical substances introduced into the stomach, became discoverable in the various tissues and structures, by their appropriate tests. In the first, he had fed a rabbit for some time on food mixed with strontian, expecting that this substance might be discovered in the bones, where it would replace the lime; but he could not arrive at any satisfactory result, from the difficulty of separating the strontian from the lime in analysis. Acetate of lead was the next substance he experimented with. Two rabbits which had taken this substance with their food, died at different intervals, without any appreciable paralysis having taken place; on the most minute chemical investigations not a trace of the salt could be detected, except in the cerebral tissue; the mucous coat of the stomach was so altered in these experiments, that on separating the contents of that viscus, its internal coat was removed, appearing as a soft unorganized layer

Digitized by Google

of mucus on the surface of the mass. The Report concluded with some experiments made by injecting solutions of isomorphous salts into the veins; they appeared to confirm an opinion suggested to the author by former experiments, namely, that isomorphism, existing in even widely different classes of chemical agents, appears to determine identity of effect in their physiological action on the nervous system. This subject, the author observed, opened a wide field of inquiry and speculation, but it would be premature and injurious to draw any conclusions on the subject in the present imperfect condition of animal chemistry.

Dr. POPHAM laid before the Section a Statistical Report of the cases admitted into the North Cork Infirmary during the last five years, with the results.

Dr. M'EVERS detailed a remarkable case of malformation.

SECTION F.—STATISTICS.

MONDAY.

Prof. LAWSON, T.C.D., read a paper 'On the Connexion between Statistics and Political Economy.'—The Professor began with remarking, that Statistics present nothing but a dull and barren show of figures, until united with the principles which belong to Political Economy. The former study bears to the latter the same relation which Experimental Philosophy bears to Mathematics. Political Economy, though a mixed science, yet has its abstract part, and the application of the principles thence derived to facts, lead us on to new truths. Statistics afford at once the materials and the test of Political Economy. The Professor then adduced an example of the way in which Statistics frequently correct Political Economy. In Edinburgh, the proportion of marriages to the whole population, is 1 in 136. In Leith, however, where the population is of much humbler grade, the proportion is 1 in 110. Again, in Perth, there is 1 marriage to 159 inhabitants; while in Dundee, which is a much poorer place, there is 1 in 111 inhabitants. Thus Statistics prove, that poverty is not a check on marriage, though political economists have always assumed that it is. We find another example in the doctrine of Profits and Wages, which Mr. Ricardo, followed by other political economists, held to be antagonistic, the increase of wages diminishing profits, and *vice versâ;* whereas Mr. Senior, on looking to facts, found that wages and profits usually rise and fall together. Mr. Ricardo's error, in this instance, is traceable to ambiguity of expression. While Statistics afford materials and a test to Political Economy, the latter points out the proper object of statistical inquiry, and draws conclusions from their results.

Mr. J. HEYWOOD read an abstract of the 'Report of the French Minister of Public Instruction on the Higher Schools of France,' which we omit, as we shall take an opportunity of noticing the original work.

Dr. OSBORNE read an elaborate report 'On the Statistics of Lunacy, with special relation to the Asylum in Cork,'—the material part of which will be shortly published.

TUESDAY.

At the opening of the Section the Secretary informed the meeting that in consequence of a communication which had been received from his Excellency the Lord Lieutenant of Ireland, Capt. Larcom, R.E., would commence business by laying the Report of the Census of Ireland for 1841 on the table, and giving an account of the manner in which it had been taken. He then read a note from his Excellency's Secretary, which stated that his Excellency, desirous of promoting science, had allowed a copy of the unpublished Census of 1841 to be forwarded to the Association.

Capt. LARCOM said, that he was appointed in 1841 a Commissioner of the Census in Ireland, and as the publication of the Ordnance Memoirs was then suspended, he seized the opportunity of collecting statistical information. Under the head of social economy the commissioners included every matter of interest that bore on the state of the country and its inhabitants; and the result is, that the present Census has more the aspect of a statistical document than returns of the kind have had before. Care has been taken to distinguish between natural families and the domestic groups formed of the former with associated inmates The dwellings, too, have been carefully classified; and the people generally have been considered, not under the usual head of agriculturists and manufacturers, but under the three heads, workmen, master workmen, and employers. The chief results of the Census are, in numbers, as follows:—The population of Ireland is 8,175,124, of whom 4,019,576 are males, and 4,155,548 females. These persons live in 1,472,739 social families, and are dwelling in 1,328,839 houses.

Of these persons	2,765,212 males 2,662,023 females	} are unmarried.
	1,142,628 males 1,181,095 females	} are married.
And	111,736 males 312,420 females	} are widowed.

The education varies from the county of Antrim, in which there are 21 per cent. of males, and 23 per cent. of females, who can neither read nor write, to the county of Mayo, in which there are 73 per cent. of males, and 87 per cent. of females, in the like deplorable state of ignorance. The number of houses compared with the population, does not appear at first sight very disproportionate, but when the houses are divided into classes, according to their quality and the number of families they respectively accommodate, the result is, that nearly half the families of the rural population, and more than one-third of the civic population, are found to be living in the lowest state, viz. a cabin of a single room. In the next class, but little superior in comfort, are about the same proportion; and the number living in the better classes are but 16 per cent. in the towns, and 30 per cent. in the civic districts. The tables of ages are much disturbed by the amount of emigration for the last twenty years; which amount of emigration is very uncertain, from the great number of Irish who sail from English ports, where, of course, no separate registry of them is kept; but from the best information attainable, it amounted, between 1821 and 1841, to 538,285; and 39,179 recruits for the army have been raised in Ireland during that time. It was necessary to inquire into these numbers, in order to account for the apparently small increase of the population during the last ten years, which is only 5 per cent., whereas during the former ten years it was stated to have been 14 per cent. There are some grounds for supposing that it was not really so great as 14 per cent. between 1821 and 1831, and when due allowances are made for emigration and other draughts on the Irish population, especially to more profitable labour in England than their own country afforded, the real increase between 1821 and 1831 appears to have been 12 per cent., though only 5 per cent. remained in Ireland on the 5th of June, 1841. The number of persons of Irish birth dwelling in Great Britain is 419,256, being 1 in 54 of the population of these parts of the empire, while of the natives of Great Britain dwelling in Ireland there are but 30,137, or 1 in 271 of its population. It ought to be stated in connexion with education, that the number of children at school was, at the time the census was taken, 502,950 of both sexes. It is difficult to find any document with which to compare these numbers, as all the returns give the number of "children on the poll," instead of the number actually attending, and the only documents which even with this defect embrace the schools of the whole kingdom are the census of 1821—

Which gave	394,813
Return of 1834 Commission of Inquiry for general instruction	509,150
Census of 1834 by Commission for religious and public instruction	681,000
Census of 1841	502,950

and of these the second and third are professedly of children on the poll. Thus the number in 1841 was only about one quarter of the children who were at that time between the ages of 5 and 15. It is true that this proportion is altogether very small, but as the time that the children of the humbler classes remain at school is very short, it is not impossible but that even with this small number at one time, all may, during some portion of the long period of ten years, be receiving elementary instruction.

Signor ENRICO MAYER, of Milan, then read a Report on the Infant Industrial Schools of Tuscany.—The first infant schools, or, as they are there called, asylums, established in Tuscany, were opened simultaneously in Leghorn and Pisa in 1833. A third was soon after opened in Florence, and the example then was generally followed. They are supported wholly by voluntary contributions, and consequently their increase soon reached its furthest limit. There are now twenty of those infant schools, with 2,000 children. The annual expenditure comes to about 1*l.* sterling a child, house rent, servant's wages, teacher's salary, and soup, being all included. The management of these schools generally rests with committees of ladies, who take by turn the duty of inspection: the remarks written in the inspectors' book become the subject of deliberation at the monthly meetings of the committee. The infant asylums of Tuscany are intended for the poor, and are entirely gratuitous. They are generally divided into two classes, having each a separate room, and a separate mistress. The first class contains children from eighteen months or two years to four or five years old. The second class contains children from four or five to seven or eight. A play-ground is attached to every asylum, and the children perform easy gymnastic exercises, which, however, do not interfere with their own choice of amusements. The introduction of manual works in the infant asylums in Italy constitutes one of the chief differences between them and similar institutions in France or England, and experiments are now making to continue the habits of early industry thus acquired, by procuring some work in the primary schools. A committee of tradesmen and artisans forms part of the society for infant schools at Florence, and they are to provide the children with some easy work, and facilitate afterwards their being employed in the exercise of different arts and trades. Linear drawing and the rudiments of geometry and mechanics are taught in the superior classes, but confining the instruction to that which can be of use in the exercise of every mechanical profession, without taking any one particularly in view. It is anxiously desired that the manual work of the children should be of a nature to be carried on individually, so that the social element of family life should continue undisturbed among them, and the infant population should be preserved as long as possible from the infection of factories. *Instruction* is much less than *education* the object of these infant asylums; these are made as much as possible conducive to moral training, and this by the most simple and gentle means of a maternal guidance. In the school room the children pass through a series of exercises calculated to develope their mental and bodily faculties without tiring them. They are never kept sitting for more than a quarter of an hour at a time. The religious instruction of the children is directed by the curate of the parish in which the asylum is established. The mistresses of the asylums keep a journal, in which the moral history of the institution can be said to be contained, and from which a number of most interesting facts have been extracted, elucidating the workings of human intelligence and human affection, at an age which has not until now been sufficiently studied by the moral philosopher. Though the Tuscan infant asylums are of so recent a date, yet their effects are already, and in a remarkable degree, perceptible. The improvement in the health of the children received in the Tuscan asylums is a most striking fact. The study of this fact on the part of our medical committees has led to most important observations, not only with respect to the infants themselves, but extended to their families, and indeed to the whole of the poor population of our towns, and to the various districts of the towns themselves. The cases of death in our asylums is between 2 and 3 per cent., whilst the general mortality of children between two and six is in Florence 16 per cent. The same results have been observed in Lombardy, where infant asylums are more numerous than in Tuscany. A thorough reform of every system of education, going through every species of schools, will be necessary, in order to put them on a par with the high educational character of our infant schools. The moral results likewise are not confined to the infants themselves, but are extended to their families. A great proportion of the children received at the infant asylums in Florence are found to come from the Foundling Hospital; indeed, out of 600 children, *four hundred* belong to that class. They are children whose parents were forced by extreme destitution to abandon them; but as soon as our infant asylums were known to exist, parental affection resumed its rights in the hearts of those hundreds of parents, and a dishonouring brand

Digitized by Google

was wiped away from the head of those hundreds of children, who found again the joy of their family, and were restored to their name and their civil condition. In the three years anterior to the opening of the infant asylums, the average number of children taken out of the Foundling Hospital was 176; but in 1833, when the asylums were first established, the number withdrawn was 214, and in 1837 it increased to 404. Few facts more pregnant than this with important consequences have ever been brought to light in the moral statistics of any country. The author, in conclusion, pointed out the superior efficacy of the elevating and kindly treatment of men above the harsh and repressive. "Who," he observed, "has not seen in the bad direction of public instruction or in the mismanagement of public charities a necessity for the increase of coercive institutions, which yet prove insufficient for the repression of crime; and has not learned to conclude that there may be a system of instruction which teaches no virtue, a system of charity which relieves no misery, and a system of punishment which puts a stop to no crime?"

Mr. O'FLANAGAN then read a paper, containing a description of the Blackwater River, after which a long discussion ensued, when it was agreed that a party should be formed to visit the described localities on Friday, Sir Richard Musgrave and Lord Mountcashel engaging to find boats for the purpose. Thanks having been voted to the Lord Lieutenant, and to the officers of the Section, the Section then adjourned.

SECTION G.—MECHANICAL SCIENCE.

Mr. J. JUCKES exhibited the model of his Furnace for Burning Smoke, with fire-bars consisting of endless chains passing over rollers, which was explained at the last Manchester meeting.

A communication from Mr. L. Cooke, of Parsonstown, describing a Clock Movement of his invention, and a new mode of suspending the pendulum, was read by Mr. TAYLOR. In this contrivance the pendulum is detached from all parts of the clock movement, and is in contact only at the suspending needle points. The pendulum is made to vibrate in half-seconds, by which means the variations owing to expansion and contraction are greatly diminished, and that source of error is further corrected by a compensating mechanical pendulum.

Mr. P. LEAHY read a paper, on a method of ascertaining inaccessible distances at sea or land, for which he claimed the advantages of greater accuracy and expedition than by the method of measuring a base line by the log. On his plan two small telescopes are fixed at the greatest distance the vessel will admit of, and so as to form some multiple of ten feet. This distance forms the base line on which the calculations are to be made.—Mr. MACNEILL being requested by Dr. Scoresby to state his opinion of the invention, the latter said that it was sound in principle, but he thought with so short a base line and with the difficulty of taking simultaneous observations at sea, it would be liable to inaccuracy.

Mr. HAWKINS made a communication on the formation of Concrete, showing more particularly the importance of having the stones of the proper sizes, so that the smaller ones should as nearly as possible fill up the interstices of the larger. Where the sizes were properly adjusted, he found that one proportion of lime to twenty of shingle, formed a stronger concrete than when larger proportions of lime were used. Some engineers are in the habit of using one of lime to six of shingle, and the proportions generally used are as one to eight. A specimen of concrete made in the proportions he recommended, and with shingle of proper sizes, was found after a short time to be stronger than an old Roman wall.—Mr. MACNEILL said he preferred artificial cement to lime, and he had found great advantage to result from allowing the mass of concrete to fall from a height, by which means the shingle became more compressed together. Mine dust mixed with the lime, he believed, made the most perfect concrete.—Mr. JESSOP and Mr. TAYLOR also approved of mine dust. The latter observed, that it was probably from the quantity of iron in mine dust, that its adhesive properties were derived.

Mr. HAWKINS read a paper on the friction of water against water, as exemplified in the well-known experiment of emptying a vessel full of water by sending a jet of the fluid through it. This friction of the particles of fluid against each other, caused the principal obstruction to the motion of ships through the water; and he conceived that it would be advantageous to grease the bottoms of ships to diminish the friction.

Sir T. DEANE explained the method adopted by his brother, Mr. A. Deane, to raise the *Inniskaile* steam vessel, of 500 tons, which was sunk by striking against an anchor in the Cork river a few years ago. The ordinary methods of raising sunken ships having proved ineffectual, a coffer-dam was made round the vessel in the middle of the river; and pumped dry by means of eight or nine chain pumps. The leak was ascertained by digging under the ship, and a cow hide was nailed over it to keep it water-tight. The coffer-dam was removed as quickly as possible, when the *Inniskaile* again floated by her own buoyancy, and the steam having been got up, she was taken to Passage to undergo the necessary repairs. The whole cost was 400*l.*, and the work was done in the course of four tides.

Mr. LUCAS, in the absence of Mr. Fairbairn, reported the progress of the Committee appointed at the last meeting, to ascertain experimentally whether any and what changes take place in the internal constitution of metals when exposed to continual vibration and concussion. (The results of these experiments were stated in Section A. on Saturday, by Mr. Hodgkinson—see *ante*, p. 799).—The effect of concussion on the shafts of tilt hammers is very remarkable. The shafts are made of the best ash, but after three or four months' use the strength of the wood is so much deteriorated that the shafts break off short as if they were rotten. Copper is also similarly affected by concussion, and in working copper articles, and in rolling silvered plates of copper, the workmen find it necessary to anneal the metal to prevent it from breaking.—Mr. J. TAYLOR observed that this subject had been much discussed at Manchester, and with the same results. He alluded to the difficulty of procuring good chains, and said it occurred to him that probably it might arise from the chain maker being *too good* a workman, and that the evil was caused by too much swaging in finishing the work. If, however, the quality of the iron could be restored by annealing, as might be inferred from these experiments, that would present the means of obtaining good chains in the first instance and of strengthening them after use.

Mr. J. E. PURSER exhibited Life Preservers of his invention, which are applicable in cases of fire and of shipwreck.—To show the value of this first invention, he descended from an upper window of the court house; and he tested the efficacy of the water-escape cork-jacket at Cove during the excursion on Thursday.

Mr. J. TAYLOR described a simple Steam-engine Indicator, which had been invented by Mr. A. Rous, who was formerly a working engineer in Cornwall. In consists of a half-second pendulum, to which a pencil is fixed and pointed against a card. The card is attached to the beam of the engine, and as it moves perpendicularly the pencil on the pendulum marks on it waving lines, which are wide apart when the piston moves quickly, and closer together as the velocity of the piston decreases. The distances between the lines indicate the spaces moved through by the piston in half a second in different parts of the stroke.

WEDNESDAY.

The Rev. Mr. SCORESBY described an apparatus for simplifying the illustration of trigonometrical operations, especially with reference to the purposes of education. It is called by the inventor a trigonometrical indicator.

Mr. H. HENESSY read a paper on a very simple apparatus for the purpose of determining the distance of objects. A moveable base line carries on it a small arc, by which the approximate determination of distances of 500 feet is easily effected.

Mr. G. WHITE communicated an account of Mr. Starkey's system of filtration by compressed sponge.

Mr. MACNEILL concluded the business of the Section by congratulating the mechanical gentlemen of Ireland on the circumstance of this meeting having taken place among them. Their intercourse with such men of science as compose the British Association must have a powerful tendency to excite and develope native talent.

Just published, price 8*s.* 6*d.*

LE COMPLÉMENT du TRÉSOR de l'ÉCOLIER FRANCAIS. By F. DE PORQUET. Those who have been accustomed to use the 'Trésor' will find this an invaluable appendant to that work, and well calculated to expedite, and carry out more fully, that method of teaching languages which has hitherto proved so eminently successful.

SUSSEX MEMORIAL.

THE Political and Personal Friends and Admirers of H.R.H. the Duke of Sussex, the Brotherhood of Freemasons, the Patrons of Art, Science, and Literature, and those interested in National Monuments, will be pleased to receive 'THE BUILDER' of Saturday next, the 23rd inst., containing two large Engravings of the proposed SUSSEX MEMORIAL, from the Design of Mr. Hansom, Architect of the Birmingham Town Hall: together, with a lengthened description and reference to Memorial Structures generally.

'The Builder' will contain, besides several Designs for Cottages, and a great fund of interesting matter, Sixteen Pages, price only 3*d.*, stamped.

Advertisements received till Thursday at Noon; an extra number will be printed over the usual impression of 5000.

Orders received by all Newsmen and Booksellers. Office, No. 2, York-street, Covent-garden.

FREEMASONS' and GENERAL LIFE ASSURANCE COMPANY, 11, Waterloo-place, Pall Mall, London.

Business transacted in all the branches and for all objects of LIFE ASSURANCE, ENDOWMENTS and ANNUITIES, and to secure CONTINGENT REVERSIONS, &c. Loans granted. Information and Prospectuses furnished by

JOSEPH BERRIDGE, Secretary.

ECONOMIC LIFE ASSURANCE SOCIETY, No. 34, Bridge-street, Blackfriars, London: established 1823. Empowered by Act of Parliament, 3 William IV.

Lower Rates of Premium than those of any other office that entitle the assured to participate in the profits.

The bonus declared in 1834 amounted upon an average to 16*l.* per cent. on the premiums then paid; and in 1839 a second bonus was awarded, amounting on the average to 31*l.* per cent. on the premiums paid during the preceding five years.

Prospectuses and other particulars may be obtained at the Office, between the hours of ten and four, or will be forwarded to persons resident in the country, on application.

CAMPBELL JAMES DOWNER, Sec.

NATIONAL LOAN FUND LIFE ASSURANCE, ANNUITY, and DEFERRED ANNUITY SOCIETY, 26, Cornhill, London.—Capital, 500,000*l.*—Empowered by Parliament.

Directors—T. LAMIE MURRAY, Esq. *Chairman.*

John Elliotson, M.D. F.R.S. | George Lungley, Esq.
John Griffith Frith, Esq. | John Rawson, Esq.
H. Gordon, Esq. | Clement Tabor, Esq.
Joseph Thompson, Esq.

Auditors—Prof. Wheatstone, F.R.S.; Prof. Graves, A.M. F.R.S.
Actuary—W. S. B. Woolhouse, Esq. F.R.A.S.

The superior advantages to those Assured with this Society will be best understood by a comparison of its principles and a reference to the last Annual Bonus declared on Policies of five years' standing, viz.:

Entry	Policy No.	Age	Sum	Annual Premium.	Bonus added.	Cash Bonus.	Premium reduced.
			£	£ *s.* *d.*	£ *s.* *d.*	£ *s.* *d.*	£ *s.* *d.*
1837	39	59	1000	67 8 4	132 14 6	58 19 9	8 19 4
1838	114	56	3000	175 15 0	296 9 7	123 0 6	16 9 7

Policies now entered upon entitled to participation in next Annual Division. Two-thirds of all premiums paid can be borrowed by the assured without loss of Policy.

F. FERGUSON CAMROUX, Secretary.

EAGLE INSURANCE COMPANY.—Notice is hereby given that, pursuant to the Deed of Settlement, an ANNUAL GENERAL MEETING of the Proprietors of Ten or more Shares, will be held at the Office of the Company, No. 3, the Crescent, New Bridge-street, Blackfriars, on Friday, the 6th of October next, at Twelve o'clock for One o'clock precisely, for the purpose of receiving the accounts of the Company, and of electing four Directors in the room of

JOHN RICHARDS, Esquire,
Sir JAMES M'GRIGOR, Bart.,
HENRY TUFNELL, Esquire, M.P.,
PETER SKIPPER, Esquire;

and one Auditor in the room of

JAMES GASCOIGNE LYNDE, Esquire,

who go out by rotation, but who are eligible to be re-elected.

H. P. SMITH, Actuary.

Eagle Life Office, 3, the Crescent, New Bridge-street, Blackfriars, 6th September, 1843.

By a Bye-law, no person can be a Candidate for the office of Director or Auditor, unless he shall give notice thereof in writing to the Actuary, fourteen days at the least previous to the General Meeting.

SCOTTISH WIDOWS' FUND and LIFE ASSURANCE SOCIETY, upon the Principle of Mutual Contribution.

Abstract Statement of the Funds as at 31st MARCH, 1843.

Sums invested in real Security	£329,670 0 0
Loans to Members, on the Security of their Policies	225,461 0 0
Sums invested in the purchase of Redeemable and Irredeemable Annuities	105,985 7 10
Sums invested in Government and Bank Stock	55,291 14 2
Value of Reversionary Rights, Government Annuities, and Feu-duties	39,897 9 1
Value of House Property and Floating Balances, after deducting the amount due under Policies emerged, but not paid	9,985 1 0
Total	£1,275,490 12 1

N.B.—Whilst this Great Fund of upwards of ONE MILLION AND A QUARTER has been accumulated, and whilst upwards of HALF A MILLION has been paid to Members, or to the representatives of Members under emerged Policies, it affords the Directors much gratification to state, that not a shilling has ever been lost upon any one of the Society's Investments.

The Annual Revenue of the Society at the same date was 202,889*l.* 14*s.* 3*d.*

Whereof arising from Premiums	£145,396 14 4
Capital	57,503 19 11
	£202,889 14 3

By order of the Court of Directors,
JOHN MACKENZIE, Manager.

LONDON OFFICE, 7, Pall Mall,
HUGH M'KEAN, Agent.

ANNUITIES.—In the AUSTRALASIAN COLONIAL AND GENERAL LIFE ASSURANCE AND ANNUITY COMPANY, Annuitants *participate in the profits of the Company*, and receive a rate of ANNUITY much more favourable than can be granted by any Company making its investments wholly in England. The Company is enabled securely to grant these favourable terms from the advantage it possesses of investing a portion of its funds at a high rate of interest.

Directors.

Edward Barnard, Esq. F.R.S.	C. E. Mangles, Esq.
Henry Buckle, Esq.	J. B. Montefiore, Esq.
John Henry Capper, Esq.	Richard Onslow, Esq.
Gideon Colquhoun, Esq.	William Walker, Esq.

Bankers—The Union Bank of London.
Colonial Bankers—The Bank of Australasia, (incorporated by Royal Charter, 1835,) No. 2, Moorgate-street.
Solicitors—Messrs. Swain, Stevens & Co.
Physician—Dr. Fraser, 62, Guildford-street.

Prospectuses, with Tables, Forms of Proposal for the purchase of an Annuity or for making an Assurance, and every information, may be obtained by application at the Office of the Company, No. 126, Bishopsgate-street, City.

EDWARD RYLEY, Sec.

JOSHUA MILNE, *Actuary.*

LOW RATES.—PARTICIPATION IN PROFITS.

THE MANAGERS OF THE SUN LIFE OFFICE beg leave to inform the public that their Rates, on Young Lives, are much lower than those of many other Offices, and that the Assured are entitled to a participation in the Profits of this Society.—Persons having Life Interests, such as Clergymen, Medical Men, and others deriving Incomes from their Professions or Trades, also those holding Estates on Lives, will see the advantage of effecting Insurances in the Sun Life Office.

Tables of Rates may be had at the Sun Life Office, in Cornhill, at the Sun Fire Office in Craig's-court, and at No. 65, Welbeck-street, Cavendish-square, London; also of any of the Agents for the Sun Fire Office.

UNITED KINGDOM LIFE ASSURANCE COMPANY, 8, Waterloo-place, Pall Mall, London.
Division of Profits among the Assured.

Honorary Presidents.

Earl of Errol	Earl Somers
Earl of Courtown	Lord Viscount Falkland
Earl Leven and Melville	Lord Elphinstone
Earl of Norbury	Lord Belhaven and Stenton.
Earl of Stair	

Directors—Jas. Stuart, Esq. *Chairman.*
Hananel De Castro, Esq. *Deputy Chairman.*

Samuel Anderson, Esq.	Charles Graham, Esq.
Hamilton Blair Avarne, Esq.	F. Charles Maitland, Esq.
Edw. Boyd, Esq. *Resident*	William Railton, Esq.
E. Lennox Boyd, Esq. *Assist. Resident*	John Ritchie, Esq.
Charles Downes, Esq.	F. H. Thomson, Esq.

Secretary—Patrick Macintyre, Esq.

This Company, established by Act of Parliament, affords the most perfect security in an ample paid-up Capital, and in the great success which has attended it since its commencement in 1834. In 1841, the Company declared an addition to the Shareholders of one-half of their Stock, and also added 2*l.* per cent. per annum, from the date of the policies to those parties who had insured with profits. The premiums, nevertheless, are on the most moderate scale, and only a moiety need be paid for the first five years, where the Insurance is for life.

The amount of bonus added to policies since the commencement of the Company in March, 1834, to the 31st Dec. 1840, is as follows:

Sum Assured.	Time Assured.	Sum added to Policy.
£1000	6 Years 10 Months	£136 13 4
1000	4 Years	80 0 0
1000	3 Years	60 0 0
1000	1 Year	20 0 0

Every information will be afforded on application to the Resident Directors, Edward Boyd, Esq. and E. Lennox Boyd, Esq., of No. 8, Waterloo-place, Pall Mall, London.

Frederick Hale Thomson, Esq. *Surgeon*, 48, Berners-street, attends at the Office daily, about half-past 2.

ARGUS LIFE ASSURANCE COMPANY, 29, Throgmorton-street, Bank.
Empowered by special Act of Parliament, 5 & 6 Will. IV. c. 76.
Thomas Farncomb, Esq. Alderman, *Chairman.*
William Leaf, Esq. *Deputy-Chairman.*

William Banbury, Esq.	Rupert Ingleby, Esq.
Edward Bates, Esq.	Thomas Kelly, Esq. Ald.
Thomas Camplin, Esq.	Jeremiah Pilcher, Esq. Sheriff of London and Middlesex
James Clift, Esq.	
Rt. Hon. J. Humphery, M.P.	Lewis Pocock, Esq.
Lord Mayor of London	

Physician—Dr. Jeaffreson, 2, Finsbury-square.
Surgeon—W. Coulson, Esq. 2, Frederick's-place, Old Jewry.
Consulting Actuary—Professor Hall, of King's College.

Advantages of the Argus Life Assurance Company.
Low Rates of Premiums.

In addition to the subscribed Capital of 300,000*l.* the assured have the security of the Company's Income of nearly 60,000*l.* per annum, yearly increasing, and an accumulating Assurance Fund invested in Government and other available Securities, of considerably larger amount than the estimated liabilities of the Company.

The Rates of Premium are reduced to the lowest scale compatible with the safety of the Assured and the stability of the Company, thereby, in effect, giving to every policy-holder an immediate and certain bonus without risk, in lieu of the deferred and frequently delusive prospect of a periodical division of profits.

Annual Premium to Assure £100.

Age.	For One Year.	For Seven Years.	Whole Term.
20	£0 17 8	£0 19 1	£1 11 10
30	1 1 8	1 2 7	2 0 7
40	1 5 0	1 6 9	2 14 10
50	1 14 1	1 19 10	4 0 11
60	3 2 4	3 17 0	6 0 10

One-third of whole-term Premiums may remain unpaid at 5 per cent. comp. int. as a debt upon the Policy for life, or may be paid off at any time without notice.

In Assurances for advances of money, as security for debts, or as a provision for a family, when the least present outlay is desirable, the varied and comprehensive Tables of the Argus Office will be found to be particularly favourable to the assured.

A Board of Directors, with the Medical Officers, attend daily, at a quarter before 2 o'clock.

EDWARD BATES, Resident Director.

A Liberal Commission to Solicitors and Agents.

VICTORIA LIFE ASSURANCE COMPANY.

Trustees.

Sir Jas. Duke, Ald. M.P. *Chairman*	Benj. Hawes, Esq. *Dep. Chairman*
Benj. Barnard, Esq.	Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus:—

Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.

Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.

Assurances may be effected *with* or *without* profits—on an ascending or descending scale, or for short periods.

Advances made to Assurers on real or undoubted personal security, for terms not exceeding three years, repayable by instalments.

Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary. WILLIAM RATRAY, Actuary and Secretary.

WESTERN LIFE ASSURANCE SOCIETY, 49, Parliament-street, Westminster.—Capital 500,000*l.*

Directors.

Henry Edgeworth Bicknell, Esq.	John Arscott Lethbridge, Esq.
William Cabel, Esq.	Edmund Lucas, Esq.
Thos. Somers Cocks, jun. Esq.	George Kennet Pollock, Esq.
George Henry Drew, Esq.	James Lys Seager, Esq.
William Evans, Esq.	John Bazley White, Esq.
William Freeman, Esq.	Joseph Carter Wood, Esq.
Francis Fuller, Esq.	Henry Wrench, Esq.
James Hunt, Esq.	

Physician—William Richard Basham, M.D.
Surgeons—Alfred Leggatt, Esq.; George D. Pollock, Esq.
Bankers—Messrs. Cocks, Biddulph & Co.
Solicitors—Messrs. J. L. Bicknell and J. C. Lethbridge.

The leading features of this Society are—

The very moderate Rate of Premium when viewed as combined with *perfect security* to the assured.

The advantage to the Assurers (by Table 2) of becoming entitled to *three-fourths* of the *profits*.

The assurance of a *certain bonus*.

The facility for *securing debts*.

The allowance of *half* the Annual Premium to remain unpaid for *seven years*, and

The accommodation of *temporary loans* to the Assured on available security. Immediate and deferred Annuities are granted by this Society on terms advantageous to the Public.

A liberal Commission allowed to Professional Gentlemen and Agents introducing business to the Office.

EDWARD T. RICHARDSON, Secretary.

PARSON'S ALEPPO OFFICE WRITING INK.—This very superior Ink, made with pure ALEPPO GALLS, is equally adapted for Quills and Steel Pens, and combines *Incorrodibility* and *Permanency of Colour* with an easy flow from the pen. It is strongly recommended to Merchants, Bankers, Solicitors, Accountants, and to all who are accustomed to write expeditiously.—Sold in Quart, Pint, Half-pint, and Sixpenny Bottles, by JOHN PARSONS, 9, Ave Maria-lane, London.

H. WALKER'S NEEDLES (by authority The 'Queen's Own') in the illustrated Chinese boxes, are now in course of delivery to the trade. The needles have large eyes, are easily threaded (even by blind persons), and have improved points, temper, and finish. Each paper is labelled with a likeness of her Majesty or his Royal Highness Prince Albert, in relief on coloured grounds. Every quality of needles, fishhooks, hooks and eyes, steel pens, &c., for shipping. These needles or pens for the home trade are sent, free, by post, by any respectable dealer, on receipt of 13 penny stamps for every shilling value.—H. Walker, Manufacturer to the Queen, 20, Maiden-lane, Wood-street, London.

STONE-COLOURED CEMENT.

FELIX AUSTIN, of the New Road, Regent's Park, begs to inform Architects, Builders, Plasterers, &c. that during the process of manufacturing a very superior composition which has greatly improved his well-known Artificial Stone Ornaments, he has succeeded in making an excellent STONE-COLOURED CEMENT, adapted to building, more especially for facing brick walls and repairing decayed stone work, which he can supply at 2*s.* 6*d.* per bushel, at his Manufactory, near the Thames Tunnel, Rotherhithe.

ELECTRO-PLATED and GILT ARTICLES.—ELKINGTON & CO., Patentees, gratefully acknowledging the distinguished patronage the articles of their manufacture have hitherto received, beg to announce that their stock, embracing every variety of NOVELTY for the SIDEBOARD, DINNER, DESSERT, and BREAKFAST TABLE, may be inspected at their Establishments,
WEST-END,—22, REGENT-STREET, corner of Jermyn-street.
CITY,—45, MOORGATE-STREET.

The Patentees beg expressly to state, that their electro-plated goods differ entirely from any hitherto offered to the public as 'plated goods,' or 'substitutes for silver.' Both in appearance, sound, and wear, these goods are equal to SOLID SILVER; they are cast and chased in SOLID WHITE METAL, and strongly plated with silver by their PATENT ELECTRO PROCESS; all joints are made with hard silver solder, which cannot be used in ordinary plated goods, and neither acids nor heat affect them.

Their ELECTRO-GILDING, for beauty of colour and facility of application to ALL METALS, is much superior to the old method of water-gilding.

Old Sheffield plate restored and re-plated; plating and gilding, on old or new articles, promptly executed, at the Manufactory, 45, Moorgate-street.

Every article made and warranted by the Patentees bears their stamp, E. & Co. over a crown.

COMPOSITION FOR WRITING WITH STEEL PENS.
STEPHENS' WRITING FLUID.

THESE COMPOSITIONS, which have so remarkably extended the use of the STEEL PEN, are brought to very great perfection, being more easy to write with, more durable, and in every respect preferable to the ordinary Ink. In warm climates they have become essential. They consist of—An INSTANTANEOUS BLACK INK—A BLUE FLUID, changing to an intense Black colour—PATENT UNCHANGEABLE BLUE FLUIDS, remaining a deep Blue colour—A SUPERIOR BLACK INK, of the common character, but more fluid—A SUPERIOR CARMINE RED for Contrast Writing—A CARBONACEOUS RECORD INK, unchangeable by any Chemical Agent—Also, a new kind of MARKING INK for Linen; and Inkholders adapted for preserving Ink from Evaporation and Dust. Bottles at 3*d.* each, convenient for writing from, are prepared, which will enable those who may wish to try either of these articles to do so at a small expense. Prepared by HENRY STEPHENS, the Inventor, 54, Stamford-street, Blackfriars-road, London; and sold by Stationers and Booksellers.—N.B. These unchangeable Blue Fluids are Patent Articles; the public are therefore cautioned against imitations, which are infringements; to sell or use which is illegal.

STEPHENS' SELECT STEEL PENS.—The utmost possible care having been bestowed upon the manufacture of these articles so as to procure the highest finish, they can be confidently recommended both for flexibility and durability.

THE OMBROSOME, or PATENT PORTABLE SHOWER BATH, especially adapted for travelling and exportation. By this Bath an inexhaustible shower is produced from a few quarts of water: the height of the shower may be increased or lessened to suit adults or children, and occupying so little room, is peculiarly suited for bed-rooms and dressing-rooms; it is also an excellent Douche Bath. Being little larger than a writing-desk when packed, it will be a great desideratum for exportation to India and other hot climates. To Military Men and others of a migratory life, also to Students of the Universities, Inns of Court, &c. (where rooms are low and water scarce), the present invention cannot fail to be most acceptable. It is made entirely of brass, and is at once simple and elegant.—May be seen at the Royal Polytechnic Institution; and be had, with Prospectuses, wholesale and for exportation, at the Manufactory, 115, Old-street; and retail at the Bazaar, Panklibanon Iron Works, 58, Baker-street; Mr. J. L. Benham, 19, Wigmore-street; Mr. C. Bray, 16, Cranbourne-street; Mr. J. Deacon, 4, Moorgate-street; Mr. J. Evans, London Bridge; Messrs. Fallows & Adcock 4, Halkin-street West; Messrs. Glenton & Chapman, 147, New Bond-street; and of all the leading Ironmongers throughout England.—Price 4*l.* 10*s.* and 5*l.* 5*s.*

WATCHES by WEBSTER & SON, Chronometer Makers to the Lords of the Admiralty (Established 132 years), 3, BIRCHIN-LANE. The largest assortment of fine Second-hand Watches of any house in London, by the most eminent makers—many nearly equal to new, and at little above half their original cost, all of which W. & Son warrant. They consist of fine Repeaters, Duplex, Lever, and Horizontal Escapements, all of superior manufacture. New Watches of the most elegant patterns upon the principle of their Chronometers, to which the Government awarded the prizes three years in succession, with compensation balances to counteract the variations of temperature. Also a large assortment of Lever and elegant Horizontal Watches, for Ladies and Gentlemen, at considerably reduced prices. Old Watches taken in exchange. The most experienced workmen are employed on the premises in the repairing department.

Webster & Son, 3, Birchin-lane, Cornhill.

BUTTER MADE IN TEN MINUTES, by the NEWLY-INVENTED CHURN, registered according to Act of Parliament.

ATTWOOD, WIMBLE & WARNER, Manufacturers, LEWES, Sussex.

This CHURN being made entirely of Block Tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which insures the butter coming in ten or twelve minutes. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use.

Sizes,	No. 1,	2,	and 3,
Churn from	7 to 8 lbs.	13 to 15 lbs.	26 to 28 lbs.
Price, carriage paid to London,	25*s.*	35*s.*	43*s.*

Metal Pans for Churns to stand in, 4*s.* 6*d.*, 6*s.*, and 7*s.* Larger sizes made to order. N.B. Thermometers and Butter Prints supplied. May be obtained through any respectable ironmonger in Town or Country, and from the Manufacturer, Lewes.

To be seen in London, at Wright's Range Warehouse, No. 3, Arthur-street, near the Monument; W. Baily & Son, Furnishing Ironmongers, 71, Gracechurch-street; Livermore & Son, Ironmongers, No. 30, Oxford-street; Benham, 19, Wigmore-street, Cavendish-square. Export Agents, Barnes & Co., 109, Fenchurch-street.

MOULD CANDLES to BURN WITHOUT SNUFFING.—KEMPTON'S PATENT.—These candles do not require snuffing; they burn longer and are cheaper than any other candle: the flame is steady and brilliant. No metallic or deleterious matter is used in the manufacture. Price 8*d.* per lb. Sold by G. E. Parish, agent for exportation, 214, Bread-street, City, and by Slodden & Stocking, 42, High-street, Marylebone; W. Gethem, Broadley-terrace, Blandford-square; W. Evans, Italian warehouse, Greenwich; John Hawkins, grocer, High-street, Whitechapel; George Hawley, grocer, Pitfield-street, Hoxton; S. Game, Fish-street-hill; J. Pain, grocer, Bethnal-green-road; G. H. Hudson, 129, Blackfriars-road; C. H. Nicholas, 19, Bolingbroke-row, Walworth; and at the manufactory, Old Bargehouse, Christchurch, Surrey.

OLD GILDING, LACKER, and BRONZE, however dirty, faded, or tarnished, rendered equal to new by UPTON'S PARISIAN DETERGENTS. The effect is sudden, astonishing, and lasting; trouble merely sponging the surface, and the expense only a few pence for the largest gilt frame, and the merest trifle for lackered articles. Fly spots are at once removed from gilding; no necessity, therefore, to cover from the fly. Gold detergent, 2*s.* 6*d.* per bottle; lacker and bronze, 1*s.* 6*d.*; lamp, 1*s.* 4*d.* All are innoxious and inoffensive. Sold by Upton & Co., Lamp-manufacturers, 33, George-street, Hanover-square, and 65, Basinghall-street, City. Established nearly 40 years. A trial allowed free of all charge. Trade supplied.

LEA & PERRIN'S 'WORCESTERSHIRE SAUCE.' Prepared from the Recipe of a Nobleman in the County.—The above celebrated Sauce has, from the time of its introduction, been steadily progressing in public favour. Its peculiar piquancy, combined with exquisite flavour, establish it of a character unequalled in sauces. Noblemen and others, of acknowledged gout, pronounce it to be 'the only good sauce;' and for enriching gravies, or as a zest for fish, curries, hashs, game, cold meat, &c., especially unrivalled. As a rapidly-increasing inquiry is now made for it in all parts of the kingdom, the Proprietors beg to state that druggists, grocers, and others may be supplied by their agents—Messrs. Barclay & Sons, Farringdon-street; Mr. J. Harding, 59, King-street, Stepney; Messrs. Metcalfe & Co. 16, Southampton-row; and by the Wholesale Oil and Italian Warehousemen in London, upon the same terms as at their Warehouse at Worcester.—Sold retail, in half-pint bottles, at 1*s.* 6*d.*; pints, 2*s.* 6*d.*; and quarts, 5*s.* each, with the Proprietors' stamp over the cork of every bottle.

FOR GOUT, RHEUMATISM, AND RHEUMATIC GOUT.

SIMCO'S GOUT and RHEUMATIC PILLS are a certain and safe remedy; they restore tranquillity to the nerves, give tone to the stomach and strength to the whole system. No other medicine can be compared to these excellent pills, as they prevent the disorder from attacking the Stomach or Head, and have restored thousands from pain and misery to health and comfort. Sold by A. Willoughby & Co., late of G. Windus, 61, Bishopsgate Without, and nearly all Medicine Venders, at 1*s.* 1½*d.* or 2*s.* 9*d.* per box.

FOR BEAUTIFYING THE SKIN.—GODFREY'S EXTRACT of ELDER FLOWERS, a most fragrant perfume, and delightful cosmetic. It speedily and completely removes tan, redness, &c., and by its cooling, balsamic, and healing qualities, renders the skin soft, pliable, and free from dryness, scurf, &c., and clears it from every humour, pimple, or eruption. By its use the skin becomes, and continues, delicately clear and soft, and the complexion fair and beautiful. In shaving, it is invaluable, rendering the skin smooth and firm, and protects it from the effects of sun and dust. It is beyond all praise as a general family lotion. Sold in bottles, price 2*s.* 9*d.*, by all respectable Medicine Venders and Perfumers.

Birch, Assistant Dept. of Antiquities, British Museum, &c. &. This Part contains Monuments illustrative of Egyptian History, also Portraits of many of the Monarchs, their Civil and Military Costume: the Tablet of Abydos, showing the royal succession: the Rosetta Stone, one of the most interesting and valuable records of antiquity (a facsimile and translation of the text is given): various figures of Priests, Royal Scribes, Bards, &c., showing the Costume and Colours at present existing.
London: published by J. Weale, 59, High Holborn, where Part I., consisting of the Mythology of this interesting People, may be obtained.

NEW WORK ON THE COLONIES.
Second Edition, now ready, in 3 vols. post 8vo.
TALES OF THE COLONIES; or, The ADVENTURES of an EMIGRANT.
By CHARLES ROWCROFT, Esq.
A late Colonial Magistrate.
"This is a book full of adventure and information. The manner, too, is as good as the matter."—*Athenæum.*
"The author's matter is solid and real—the history of a settler in Van Diemen's Land from the early formation of the colony till nearly the present time."—*Spectator.*
"Since the time of 'Robinson Crusoe' literature has produced nothing like these Tales of the Colonies."—*Metropolitan.*
"No mere romance—no mere diction, however skilfully managed or powerfully executed, can surpass it. The work to which it bears the nearest similitude is 'Robinson Crusoe,' and it is scarcely, if at all, inferior to that extraordinary work. The character of Crab is equal to anything in Sam Slick or Boz. Truth is stamped upon every feature."—*John Bull.*
Saunders & Otley, Publishers, Conduit street.

DR. M'PHERSON'S CHINA.
Now ready, Third Edition, with a Portrait of the Author, Map of the Coast, and View of the Harbour of Hong-Kong,
THE WAR IN CHINA, A NARRATIVE of the CHINESE EXPEDITION, from its Formation to the Treaty of Peace.
By D. M'PHERSON, M.D.,
Madras Army, attached to the Service of his Highness the Nizam, and lately with the 37th Grenadier Regiment in China.
"As a history of the war this work is most complete, both from the opportunities and capabilities of its author. The incidental notices of customs and manners are highly illustrative of this extraordinary people. As a narrative of the camp life of our countrymen, it is full of military anecdote and exploit, and and even of humour. The elastic spirit which buoys up the mind of the real soldier imparts its tone to the work, which, both for novelty and information, deserves to be considered as one of the most attractive productions of the present day, and to take its future stand among the most valuable of historical documents."—*Metropolitan.*
Saunders & Otley, Publishers, Conduit-street.

PHOTOGRAPHY ILLUSTRATED.
September 21 will be published, price 7s. 6d. post 8vo.

A Geographical Memoir of Abyssinia and South-Eastern Africa, by James M'Queen, Esq., grounded on the Missionaries' Journals, and the Expedition of the Pacha of Egypt up the Nile. The whole illustrated by two large Maps, engraved by Arrowsmith. In one volume, post 8vo. price 12s. in cloth.
Seeley, Burnside, & Seeley, Fleet-street, London.

13, Great Marlborough-street.
MRS. GORE'S NEW NOVEL, 'THE BANKER'S WIFE; Or, COURT AND CITY,'
IS NOW READY AT ALL THE LIBRARIES, in 3 vols.
"A work of great and sustained interest—in our opinion the best production of Mrs. Gore."—*John Bull.*
"We do not hesitate to pronounce the work before us as masterly. The cleverness of the opening portion of the story becomes absolute genius in the concluding scenes."—*Court Journ.*
Henry Colburn, Publisher, 13, Great Marlborough-street.

NEW NOVEL, BY THE AUTHOR OF 'THE OLD ENGLISH GENTLEMAN.'
Now ready, in 3 vols. with Illustrations,
THE STAGE COACH; Or, THE ROAD OF LIFE.
By JOHN MILLS, Esq.
"Full of humour and originality."—*John Bull.*
"The humorous and the serious are here happily blended, and the 'road of life' is presented in that chequered form which will afford amusement to all classes, whether candidates for the 'box' of a stage coach, or a 'box' at the Opera."—*Bell's Life.*
Henry Colburn, Publisher, 13, Great Marlborough-street.

13, Great Marlborough-street.
VOL. VI. of MISS STRICKLAND'S LIVES of the QUEENS of ENGLAND—QUEEN ELIZABETH,
IS NOW READY.
"The best picture of the reign of Elizabeth we possess in our language."—*Messenger.*
"A work of great interest, which throws an entirely new light on the life of the great Elizabeth."—*Britannia.*
"This volume is interesting in the highest degree. Miss Strickland has brought together many curious particulars of Elizabeth's private conduct and character. We are now enabled to see Elizabeth as she really was—to view her as the woman as well as the queen."—*Court Journal.*
Henry Colburn, Publisher, 13, Great Marlborough-street.

This day is published, in royal 4to. with 17 Plates and 38 Woodcuts, price 25s.

Richard Bentley, New Burlington-street,
(*Publisher in Ordinary to Her Majesty.*)

In 2 vols. 8vo. with Maps and Illustrations, price 24s.
ROME,
AS IT WAS UNDER PAGANISM, AND AS IT BECAME UNDER THE POPES.
"Ages and realms are crowded in this span."
London: J. MADDEN & Co. 8, Leadenhall-street. Dublin: JOHN CUMMING, 16, Lower Ormond-quay.
"The plan of the book is meant to be a novel or irregular drama, and as such we like it."—*The Nation.* "This is a very remarkable work. The author—be he Protestant or Catholic—has succeeded in producing on the decline and fall of the Roman Empire, and the reproduction, under new forms, of the Roman influence by the Popes and the Church, an original and most valuable work."—*Tablet, July 30.* "It is abundantly evident that the author is a zealous adherent to the Romish Church—that he is deeply read in ecclesiastical literature—that he places implicit reliance on the Fathers and the received lives of the Saints; and that he has a minute and accurate knowledge of the history he proposes to examine."—*Athenæum, July 22.* "All, in truth, that could convey a vivid and re-animated likeness of what Rome was in the days of her external splendour is brought together with a brilliancy, and power, and learning, unsurpassed in the literature of the present day. But it is not alone the restoration of the outward 'mother of dead empires' that we admire so much as the knowledge of universal Roman life, its state of policy, religion, philosophy, customs, habits, feelings, which are displayed throughout every page."—*Dublin Monitor, Aug. 14.* "His familiarity with the localities of the scenes which he describes could only have been acquired by many years of residence upon the spot itself."—*Freeman's Journal.* "Admirable abilities have been called into exercise for its production, and much pains and labour, and after every drawback has been allowed, there yet remains amply enough of merit to recommend it to the world."—*Metropolitan Magazine.*

London: JAMES HOLMES, 4, Took's Court, Chancery Lane. Published every Saturday, at the ATHENÆUM OFFICE, 14, Wellington Street North, Strand, by JOHN FRANCIS, and sold by all Booksellers and Newsvenders.—Agents: for SCOTLAND, Messrs. Bell & Bradfute, Edinburgh; for IRELAND, J. Cumming, Dublin.

Particulars may be obtained from the Dean of the Medical Department.

RICHARD PARTRIDGE, Dean.
J. LONSDALE, Principal.

King's College, Sept. 22, 1843.

MANCHESTER NEW COLLEGE, in connexion with the UNIVERSITY OF LONDON.

The SESSION of 1843-44 will COMMENCE on the 2nd of October; being the first Monday in the month. The entrance examination of students who intend to pass through the full under-graduate course will take place on Friday, the 29th September.—In the Literary and Scientific Department, LECTURES will be delivered, in the coming Session, on the following subjects:

1. Greek and Latin Languages; Grammatical Structure of the English Language, and Composition of English, by F. W. NEWMAN, Esq., formerly Fellow of Balliol College, Oxford.
2. Pure and Mixed Mathematics, by R. FINLAY, Esq. B.A., Trinity College, Dublin.
3. Ancient and Modern History, by the Rev. JOHN KENRICK, M.A.
4. Mental and Moral Philosophy, and Logic, by the Rev. JAMES MARTINEAU.
5. Physical Science and Natural History, by MONTAGUE L. PHILLIPS, Esq.
6. French Language and Literature, by F. E. VEMBERGUE, Esq.
7. German Language and Literature, by Dr. BERNSTEIN.

The fee for the entire Course is 25*l.* (exclusive of French and German.) Students wishing to attend separate classes only, may get a printed statement of the studies and fees in detail at the College; or from the Secretaries, the Rev. William Gaskell, M.A., Dover-street, Chorlton-upon-Medlock; and Samuel D. Darbishire, Esq., Marsden-street, Manchester; or by letter, addressed to the Secretaries.

Students desiring information on the means of getting board and lodging may learn particulars from the Secretaries; and respectable lodging-houses are provided by the Committee.

Grosvenor-square, Chorlton-upon-Medlock,
September 20, 1843.

HOWE, LEONARD & CO., AUCTIONEERS AND COMMISSION MERCHANTS, BOSTON, UNITED STATES.—Particular attention given to Sales of New and Old Books, Paintings, Engravings, and Fancy Goods; also any other description of Merchandize. Refer to John Miller, Bookseller, London; Goddard & Hill, Birmingham.

PARENTS, ETC., STUDENTS IN MEDICINE.

DR. SALT, Fellow of the Linnæan and Medico-Botanical Societies, &c. &c., Lecturer on Obstetric and Forensic Medicine, RECEIVES STUDENTS IN MEDICINE, either as House Pupils or Boarders. Arrangements can be made for the term of a full Curriculum, or for any shorter period. The house is within ten minutes' walk of University and King's Colleges, the Middlesex and Charing Cross Schools, and the Libraries of the British Museum and Royal College of Surgeons. In addition to a more than ordinary attention to their domestic comforts, resident pupils will meet with every advantage necessary to the most effectual prosecution of their studies.—Apply (if by letter, pre-paid,) before 12 or after 4, at 102, Great Russell-street, Bedford-square.

SLOANE-STREET, opposite CADOGAN-PLACE.—A remarkably pleasant HOUSE for a small family is to be LET, situated as above. Enquire at No. 118.

FOSSIL FISHES FROM BRAZIL.

A FEW Sets of the FOSSIL FISHES, brought home by Mr. Gardner, from the chalk formation of the North of Brazil, still remain to be disposed of. They are in a beautiful state of preservation, and are all new species, named by M. Agassiz.—For reference apply to Mr. Pamplin, 45, Frith-street, Soho-square.

SCHOOL, FAMILY, and CLERICAL AGENCY, 30, SOHO-SQUARE.—Mr. HINTON, late of Trinity Hall, Cambridge, Author of 'Stenography for Schools,' &c., respectfully states that he forwards the views of Principals of Schools, Families, Clergymen, Tutors, and Assistants, in any changes they may contemplate; also in the transfer of Scholastic and Clerical Property.—Mrs. Hinton, who has resided many years on the Continent, can introduce superior English and Foreign Governesses, with good references. Letters must be free.

ST. BARTHOLOMEW'S HOSPITAL.—Medical School.—WINTER SESSION, 1843, commencing October 2.

LECTURES.

MEDICINE..G. Burrows, M.D.
SURGERY..W. Lawrence, F.R.S.
DESCRIPTIVE and SURGICAL ANATOMY..F. C. Skey, F.R.S.
GENERAL and MORBID ANATOMY and PHYSIOLOGY.. Mr. Paget.
SUPERINTENDENCE of DISSECTIONS..Mr. M'Whinnie and Mr. Ormerod.
CHEMISTRY..Mr. Griffiths.
MATERIA MEDICA and THERAPEUTICS..G. L. Roupell, M.D. F.R.S.
MIDWIFERY and DISEASES of WOMEN and CHILDREN.. E. Rigby, M.D. F.L.S.

SUMMER SESSION, 1844, commencing May 1.

BOTANY..F. J. Farre, M.D. F.L.S.
FORENSIC MEDICINE..W. Baly, M.D.
PRACTICAL CHEMISTRY and NATURAL PHILOSOPHY.. Mr. Griffiths.
COMPARATIVE ANATOMY..Mr. M'Whinnie.
MIDWIFERY..E. Rigby, M.D. F.L.S.
CLINICAL LECTURES on MEDICINE, by Dr. Roupell and Dr. G. Burrows; on SURGERY, by Mr. Lawrence and Mr. Stanley.

COLLEGIATE ESTABLISHMENT.—The Governors of the Hospital having resolved to establish the collegiate system in connexion with the Medical School, several houses within the Hospital walls have been lately fitted up for the residence of a certain number of students, and under the direction of the Treasurer and a Committee of the Governors every arrangement has been made which appears likely to promote the interests and comforts of the students. The superintendence of the establishment has been intrusted to Mr. Paget, the Resident Warden.

Further particulars in regard to every department of the school may be obtained from any of the medical or surgical officers or lecturers; or on application at the Anatomical Museum or the Library.

Sale by Auction.

LIBRARY OF THE LATE ANDREW BAIRD, M.D.

MR. FLETCHER will SELL BY AUCTION, at his Great Room, 191, Piccadilly, THIS DAY, and 7 following days (Sunday excepted),

London: Simpkin, Marshall & Co. Stationers'-hall-court.
Paris: A. & W. Galignani & Co.; and the Author.
Of whom may be had,
The Key. Post 8vo, 3*s.* 6*d.* boards.

This day is published, in royal 4to. with 17 Plates and 38 Woodcuts, price 25*s.*

PROPORTION, or the GEOMETRIC PRINCIPLE of BEAUTY, ANALYSED. By D. R. HAY, Decorative Painter to the Queen, Edinburgh.

Lately published, by the same Author,

I.

The Natural Principles and Analogy of the Harmony of Form. In 1 vol. royal 4to. with 18 Engravings and Woodcuts. Price 15*s.*

II.

The Laws of Harmonious Colouring adapted to Interior Decorations. The 4th edition, with 8 coloured Diagrams. 8vo. Price 7*s.*

William Blackwood & Sons, Edinburgh, and 22, Pall Mall London.

DONNEGAN'S GREEK LEXICON.

In a large 8vo. volume, 2*l.* 2*s.* cloth, lettered,

A NEW GREEK and ENGLISH LEXICON, By JAMES DONNEGAN, M.D. FOURTH EDITION. Printed in a new type, and in an enlarged form, which has enabled the Author to add much new matter: the increase in the number of pages amounts to ONE HUNDRED AND THIRTY-SIX. Numerous and long Articles have been *rewritten*, and all have received emendation; so that, in fact, this Edition is a NEW CAST of former ones. The Poets and Orators have been illustrated throughout, and the fullest References given. The Alexandrian and Hellenic writers have been carefully examined, with a view to the Illustration of words used in the NEW TESTAMENT, and in the Septuagint: where the meanings of words have been the subject of Controversy, references have been given to the Classical, Hellenic, and Alexandrian writers, in order to attain the true significations; with citations from, and references to, Critics and Commentators of weight and authority. The early Greek Fathers have been carefully consulted, in order to facilitate the studies of those who desire to acquire a knowledge of their writings.

London: Simpkin, Marshall & Co.

Just published,

SIR ASTLEY COOPER'S SURGERY, THIRD VOLUME.

In 8vo. 770 pages, 18*s.* cloth,

THE PRINCIPLES and PRACTICE of SURGERY, founded on the most extensive Hospital and Private Practice during a period of nearly Fifty Years. By the late Sir ASTLEY COOPER, Bart. F.R.S., Sergeant-Surgeon to the King. Vol. 3. Edited by ALEXANDER LEE, M.A. M.D., Editor and Translator of 'Celsus de Medicina.' The two first Volumes may still be had.

Vol. 1, 18*s.* cloth, or with the Plates coloured, 1*l.* 8*s.*
Vol. 2, 18*s.*, or coloured, 1*l.* 1*s.*

Also, in 1 large vol. 8vo. 1*l.* 5*s.* cloth,

THE FOREIGN AND COLONIAL REVIEW.

On the 2nd of October will be published, in 8vo. price 6*s.*

No. IV. OF

THE FOREIGN AND COLONIAL QUARTERLY REVIEW.

This Review has been established by a highly influential Literary and Mercantile Proprietary, under the Superintendence of the late Editor of the Foreign Quarterly Review, and has already obtained deserved reputation both for the vigour and information of its Articles—several of which have been publicly attributed to Members of our Government—and for the priority and accuracy of its Foreign Intelligence, which is secured through the influence of eminent Correspondents in our Colonies and on the Continent.

London: WHITTAKER & Co. Ave Maria-lane; and SMITH, ELDER & Co. 65, Cornhill.

DENHAM PARK INSTITUTION
FOR
THE TREATMENT OF MENTAL DISORDERS
AFFECTING THE UPPER CLASSES OF SOCIETY OF BOTH SEXES.

Director—EDWARD HORNOR, Esq.

Consulting and Visiting Physician—JOHN FORBES, M.D. F.R.S.,
Physician in Ordinary to Her Majesty's Household, and Physician Extraordinary to His Royal Highness Prince Albert,
12, OLD BURLINGTON-STREET, LONDON.

Resident Medical Officer—WILLIAM WILSON, M.D.

Medical Referee in London—ERASMUS WILSON, Esq., 55, Upper Charlotte-street, Fitzroy-square.

SOME changes in the direction of this Institution, and an important addition recently made to its medical staff, seem to justify the Director in calling attention to the claims which it possesses to the confidence of the public and to the support of the medical profession. It is believed that a fuller knowledge of the character of this establishment, on the part of medical men, will be found of importance to them, in many cases, when called upon to recommend a temporary abode for a patient who may be required to be removed from home. It is the object of the Director and Medical Superintendents to give to the Institution the character and appearance of a domestic retreat during the removal of a temporary disease, not of a place for the seclusion and punishment of dangerous and incurable persons. Accordingly, the greatest care is taken, not merely to discard every form of personal restraint, but, as far as practicable, to remove from the observation of the inmates everything that could tend to irritate or distress their feelings; and no pains are spared to cheer the mind, and to lessen the gloom and despondency to which so many of this class of persons are unhappily subject. Opportunities for varied occupation and amusement, within and without doors, are studiously supplied, and exercise in the open air, in the carriage and on foot, is carefully enjoined.

The excellence of the accommodations generally, and the great conveniences and comforts to be found in Denham Park, are, it is believed, of a kind that cannot fail to be approved of. The building is a fine specimen of the old English mansion, having apartments sufficiently spacious for in-door exercises during wet weather, and designed on a scale of magnificence rarely met with in modern houses. The general appearance of the house betrays nothing of its present destination, either in external or internal arrangements; and, besides the usual suites of apartments, it contains a billiard-room, a library, and a consecrated chapel, in the latter of which the patients, officers, and servants of the establishment meet daily for morning and evening prayer.

Classification forms an important part of the arrangements. The Ladies and Gentlemen have each their distinct moiety of the house, and assemble in their separate saloons, from which those are excluded who, from the state of their disorder, would be likely to prove annoying to the convalescents, or be themselves excited by the presence of company. In these reunions the invalids mingle constantly and systematically with the sane; the observances of polite society are carefully maintained; and, by judicious intercourse, the minds of the invalids are strengthened and prepared for that exercise which a return to the world may require. In some instances, where benefit is likely to result to the sufferer, and no inconvenience to the rest of the inmates, relations and friends are admitted to stay with an invalid in the house. This permission has on several occasions been found a desirable privilege, and been eagerly embraced; the arrangements, society, and resources of the establishment being such as to render it an agreeable place of residence to all.

The advantages offered by this Institution for the retirement of Ladies are considered to be especially worthy of notice: they will be found to be highly appreciated by several now resident there.

The Terms of Admission for both Sexes at Denham Park are moderate, and are regulated according to the following among other circumstances: I. The nature and extent of private accommodation required. II. The amount of domestic attendance rendered necessary by the nature of the individual case; or required for the special comfort and convenience of the patient. III. The kind and amount of horse or carriage exercise required as a luxury, beyond what is deemed of importance medicinally, and which is always furnished. IV. The pecuniary means of the Patient; a small number, to whom it is an object, being from time to time received at an inferior charge, provided they are desirable inmates from their position in society and the nature of their malady.

When required, highly responsible persons are sent for patients to any part of the kingdom.

Denham Park is situated on the Oxford Road, two miles from Uxbridge, and within easy reach of the West Drayton and Slough Stations of the Great Western Railway.

Full particulars may be obtained from the Director by letter or personal application, (Denham Park, Uxbridge, Middlesex,) or of any of the Medical Officers.

JUNE 20th, 1843. EDWARD HORNOR.

On the 2nd of October will be published, price 8*d.*,

TEGG'S MAGAZINE;

WITH THE PRIZE ESSAY 'ON DECISION OF CHARACTER.'

Prospectus.

The design of this undertaking originated with the Publisher; but in bringing it to maturity he has been assisted by gentlemen whose sound judgment, distinguished scholarship, and practised pens, combined with his own experience in the conduct of literary undertakings, give every assurance that the objects he has in view will be carried out in a manner equally satisfactory to the public as to himself.

The motive which actuates him is a strong feeling that the numerous periodicals now in existence do not effect their proper object—the creation of a healthy appetite for reading of a higher order—but rather tend to deprave the taste, and to frustrate the end for which they were originally projected. The young, particularly, to whom the current periodical literature is very attractive, are most open to injuries from its vitiating tendency, and most in need of a work which shall furnish them with a more pure supply.

It is proposed therefore to produce a Monthly Miscellany, which shall be surpassed by none in variety and excellence of matter, and which, keeping pace with the rapid advance of science and art so particularly distinguishing the nineteenth century, shall record each successive improvement, and at the same time trace back its history to its birth.

The wonderful progress of Modern Discovery by sea and land, and the never-ceasing changes and improvements throughout the world; illustrated Descriptions of the most remarkable objects, either natural or artificial, which are to be found throughout its wide extent; Delineations of Natural History, more especially of the Animal and Vegetable Kingdoms in newly-settled colonies; Historical Details, drawing from their venerable repositories accounts of the Customs and Manners and Pastimes of the ages long gone by, and comparing them with those for which they have been exchanged; Biographical Sketches; Articles of Fiction, and others of general interest, which scarcely admit of classification: all these subjects, together with numberless others which it is impossible to particularise, developed by able heads and ready pens, and further elucidated and adorned by woodcuts and engravings of first-rate excellence, will, it is hoped and believed, combine to form a Magazine of an excellence yet unattained, and which can scarcely require further security for its success than to be generally known to the heads of families, the conductors of education, and the reading portion of society.

Among the more important objects to which attention will be particularly directed, is the History of Man in his Social State—a subject hitherto but very slightly touched on in any professedly popular work; of deep importance, yet yielding at the same time an exhaustless store of entertainment, to which no human being can be indifferent. It is here proposed to treat of the Varieties of the Human Species, showing the influence of Climate, Habit, and Education upon mankind. The advantages of this peculiar study, to a people who are annually emigrating in thousands into countries occupied by aboriginal tribes, are highly important, and cannot fail to give a peculiar value to any work which shall discuss the subject in a manner at once scientific and popular.

One other peculiarity attending this New Cabinet of Useful and Entertaining Literature requires to be mentioned. The Publisher, after much reflection, has decided upon making a novel experiment—or rather reviving an excellent practice now fallen into desuetude—one that will augment his own labour, but be inevitably attended with wide-spread advantages, and a high degree of pleasure, to those for whom alone it is intended. *He purposes to offer monthly prizes* (the works of some admired author) *for the best Articles, Essays, or Papers, on given subjects;* these will be regularly announced on the wrapper of each Number. This competition must inevitably awaken talent that otherwise might have slept for ever; and experience teaches us, that precocity or presumption seldom indicates a high order of intellect.

The Publisher offers no pledge to the youth of England for his future conduct in catering for their intellectual entertainment. He appeals confidently to the vast amount of entertaining knowledge which he has already furnished them. To others, he feels that no promise of future exertion is necessary. A long life of commercial industry and enterprise passed amongst them will secure their confidence. Never were the results of that experience and intercourse which his position has given him, more likely to prove beneficial to his patrons than in the present instance; for he has resolved upon devoting (as a source of self-gratification) a large portion of his time to the selection and accumulation of materials to be placed in the hands of his Editor. And he would further observe that, from the quantity of matter, variety and value of its contents, frequent introduction of illustrations, and unprecedented accumulation of interesting facts, TEGG'S MAGAZINE will be decidedly the cheapest periodical of its kind ever published.

The subject proposed for the next Prize, to be published on the 1st of December, is

'THE FALLACIES OF HISTORY.'

CONDITIONS AND PLAN.

1. The Work to be published in Monthly Numbers at 8*d.* each.
2. Each Number will consist of Two Sheets, closely printed in small royal octavo, and occasionally ornamented with Engravings.
3. A few Advertisements, principally of a literary character, will be admitted at a moderate rate, as per printed scale.

London: printed for THOMAS TEGG, 73, Cheapside; Griffin & Co., Glasgow; and T. Le Messurier, Dublin: to whom all Communications for the Editor are requested to be addressed.

LONDON, SATURDAY, SEPTEMBER 23, 1843.

REVIEWS

A Cotemporary Narrative of the Proceedings against Dame Alice Kyteler or Ketler, prosecuted for Sorcery in 1344. Edited by T. Wright, Esq. F.S.A., &c. London, printed for the Camden Society.

We know so very little of the social condition of Ireland under the Plantagenets, that any contribution to our limited stock of information is sure to be received with thankfulness; but the narrative before us has a double interest: it opens to us one of the most singular chapters in the history of English superstition, and, at the same time, sets before us a picture of some of those anomalies which for centuries have rendered Ireland a source of perplexity to historians and anxiety to statesmen. Mr. Wright has directed his attention chiefly to illustrating the prevalence of the belief in witchcraft, one of the oldest and most deeply rooted articles of English superstition: we shall not follow him into so wide a field, but shall examine the history of the actors, and the events, in connexion with the state of Irish society during the fourteenth century.

Richard de Ledred, Bishop of Ossory, one of the principal characters in the strange drama of which we have to give an account, was originally a Franciscan friar of London. He was consecrated Bishop of Ossory by mandate of Pope John XXII., at Avignon, in 1318, the year in which Edward Bruce and his Irish allies were defeated near Dundalk, and the Scottish dominion in Ireland overthrown. The attempt of Edward Bruce to carve out for himself a kingdom in Ireland after his brother Robert had been secured in the possession of the throne of Scotland, gave great offence to the court of Rome. Pope John, indeed, received the Irish manifesto of grievances with some symptoms of favour; he commanded a truce for two years between the English government and its opponents, a proof that he did not then regard the Irish insurgents as rebels; but Bruce, either from his natural impetuosity of temper, or from the difficulty of procuring provisions for his numerous followers, disregarded the injunction, and thus ended the doubts of the sovereign pontiff. But there were other circumstances which hastened his decision; one of the grievances of which the Irish had most loudly complained was, that the best sees and benefices were conferred upon Englishmen and other foreigners, to the exclusion of the native clergy, and the court of Rome was rather sharply censured for having sanctioned such an abuse. Furthermore, the native clergy, which had to a great extent identified itself with the cause of the insurgents, showed a disposition to treat the claims of papal supremacy with little favour. They denounced the bull by which Pope Adrian had conferred the sovereignty of Ireland on Henry the Second, and his successors, as palpably unjust, and took upon themselves to remedy this injustice by electing a king for themselves; "thus," says Phelan, "they had shifted the question from the maladministration of England to the sovereignty of the Vatican, and left but one answer to its indignant majesty." Bulls of excommunication were fulminated against the Bruces, and against all their supporters, both lay and clerical; vacant sees were conferred only upon those who were staunch adherents to the conjoint cause of the English crown and the Romish tiara; the Irish insurrection was denounced as a heresy, and charges of witchcraft and sorcery were added, as has always been the case when ecclesiastical vengeance is directed against real or supposed sectarians. At this crisis Richard de Ledred was appointed Bishop of Ossory, and he came to Ireland resolved to exterminate treason, heresy, and sorcery, crimes which the peculiar circumstances of the time had strangely jumbled together.

The palatinate of Kilkenny, of which the bishopric of Ossory formed an important part, was at this period occupied by the descendants of the most daring and adventurous of the companions of Strongbow. Their allegiance to the crown had been nominal from the beginning; they were the sons of those who either having obtained small grants from William the Conqueror, or having soon wasted the estates conferred upon them by that monarch, had conquered the county of Pembroke for their own behoof, with armies composed of dissipated Normans and disaffected Saxons; the latter, indeed, flocked in such numbers to a district then far removed beyond the direct control of the sovereign, that the county of Pembroke obtained the name of "little England beyond Wales." Most of the nobles in the palatinate of Kilkenny had come from the colony in Pembroke, and had brought with them the same turbulent dispositions, and the same reluctance to yield obedience, which were for centuries characteristic of "little England beyond Wales." William le Kiteler, or Ketler, Viscount of the liberties of Kilkenny, appears to have been rather unscrupulous in his administration. Among the patent rolls of Edward I. there is a complaint that he stormed the house of William Outlaw, and took from thence a sum of 3,000*l.* which had been intrusted to the said Outlaw by Adam le Blond of Callen, and Alice his wife. A claim was made to this money in the name of the sovereign, as "treasure trove," and at the same time the original owners, Adam le Blond and his wife, whose complaints had been found inconvenient, were thrown into prison on various false charges. It appears that the Ketlers and the Outlaws became reconciled, and cemented their union by marriage, for Dame Alice Ketler is called the mother of William Outlaw, and we faintly gather from the imperfect records of the time, that William Ketler was her husband of a second marriage, whence we may conclude that William Outlaw was her son by a previous union. The circumstances connected with the discovery of the money deposited in Outlaw's house were distorted and misrepresented by popular report; the simple explanation that the money had been deposited there by the Blonds would not be willingly received in an age of superstition, when marvels and miracles were deemed to be of daily occurrence, particularly as the fact of the deposit was denied both by the Outlaws and the Ketlers. It was therefore necessary to devise some new theory, and, finally, the popular explanation of the wealth of the Outlaws was, that Dame Alice Ketler used to go through the streets of Kilkenny every evening "between complin and curfew," (that is, between the hour for evening prayer and the commencement of night,) sweeping the refuse of the streets to her son's door, muttering as she went the following incantation—

> To the house of William, my son,
> Hie all the wealth of Kilkenny town.

This story, parallels to which might easily be supplied almost within our own day, was very generally credited when Bishop de Ledred came to administer the see of Ossory. He had, however, to contend against a spirit more formidable than witchcraft, for in the canons which he published for the regulation of his diocese, we find him complaining of an innovating set of miscreants (*gens pestifera novella*) who refused to pay ecclesiastical dues or tithes, who showed no reverence to episcopal dignity, and who plundered the church lands in the diocese of Ossory without the least remorse or scruple. William Outlaw was probably one of these practical heretics, for we find an enrolment of his having obtained pardon for several felonies, and also of his being indebted to the prior of Kilmainham 1,000*l.*, apparently as a compensation for some damage inflicted on the lands of the priory. There are some obscure intimations that Dame Alice encouraged her son in these sacrilegious proceedings, and there is abundant evidence that she did not scruple to employ the most violent and illegal means to increase the wealth of her favourite. In the year 1324, Dame Alice, her son William Outlaw, and her two attendants (Petronilla and Basilia), were brought before the spiritual court to answer to a charge of witchcraft. The indictment is of considerable length, but the leading points may be briefly stated. In addition to using the rhyming incantation already quoted, she was accused of having made assignations at certain cross-roads (*in quadriviis*) with an evil spirit named Robin Artysson (*Artis fllium*) one of the lowest rank of demons (*ex pauperioribus inferni*), or, what we might call, a very poor devil. It was said, that on these occasions she feasted her paramour upon nine red cocks, and an unknown number of peacocks' eyes; that she manufactured doses, unguents and candles, out of certain loathsome insects, poisonous herbs, the fat and brains of unbaptized children, and certain other horrible ingredients, all of which were boiled together in the skull of a malefactor stolen from a gibbet. On these occasions it was stated that the accused celebrated a parody on the sacrifice of the mass, after which they pronounced sentence of excommunication against all their enemies, including their husbands, cursing them specifically in all the limbs and articulations of their bodies (*per omnia membra expressa nominatim et sigillatim*). Dame Alice was further accused of having destroyed four husbands by these diabolical means, and of having reduced her fifth husband, Lord John de Poer, to such a condition that he had lost his nails and hair. These crimes she was said to have committed in order to gratify her demoniacal paramour Robin Artysson, and, as an aggravation of her guilt, it was noticed that he was the most vulgar and low-born of all the devils in hell; that he only appeared in the shape of a cat or of a black hairy dog, or, when in a very good humour, in the form of a negro. When he took the latter guise, he was accustomed to bring with him two negro devils, rather better looking than himself, as companions for Petronilla and Basilia.

William Outlaw, aware of the danger to which his mother and himself were exposed, sought the protection of his brother, who was Prior of Kilmainham, Lord Chancellor of Ireland, and the acting Lord-Deputy of the kingdom; but as little reverence was at this time paid to the central power, he further strengthened himself by an alliance with the Lord Arnold de la Poer, seneschal of the Palatinate, to which Kilkenny then belonged; he thus acquired sufficient influence to have the warrants refused, which were demanded for the arrest of Dame Alice and her accomplices. In spite of the Bishop's remonstrances the lady was allowed to make her defence by her proctor. After a protracted struggle Dame Alice was excommunicated, and a citation issued commanding William Outlaw to appear on a charge of heresy and the abetting of heresy. The efforts of the Seneschal, Poer, to have this citation withdrawn proved unavailing; he took the rash step of arresting

Digitized by Google

the Bishop himself for various misdemeanours, but chiefly for having defrauded a widow, whose husband had died intestate, of her inheritance. It was pleaded by the Bishop that he was bound to answer in the King's courts, and not in those of the Palatinate; and that the charge of defrauding the widow being a testamentary question, belonged to the ecclesiastical and not to the civil law. At the same time all the neighbouring lords, indignant at the insult offered the Bishop, flocked to visit him in his place of confinement, "so that it resembled a court rather than a prison," while their ladies sent him presents of wine, game, and other delicacies, which enabled him to entertain these visitors in the most princely style. Arnold de la Poer found that he had made a false move in seizing the prelate, and when the day for the appearance of William Outlaw had passed, he ordered Bishop Ledred to be set at liberty. Freedom was not enough for Ledred; he would not quit the prison until he had assembled all the canons and clergy of the diocese, after which, arrayed in full pontifical robes, with crosses, censers, and banners of the church borne before him, he proceeded in state to the cathedral, where he preached a sermon from the text—"Our soul is escaped as a bird out of the snare of the fowlers; the snare is broken, and we are escaped. Our help is in the name of the Lord, who made heaven and earth"—(Psalm cxxiv, 7, 8). The historian does not give us any particulars of the sermon, but he intimates that such a "screed of doctrine" against heresy and profaneness had never before been heard in the diocese of Ossory.

While the Seneschal was attacking the Bishop in the superior courts in Dublin, Ledred adopted a new and unexpected measure, which produced a great sensation. Arrayed in his pontifical robes, and bearing a consecrated host in his hands, he suddenly presented himself in the Palatine court, and called upon the Seneschal, in pursuance of the oath of office which he had sworn, to lend his aid for the suppression of heresy and witchcraft. Lord Arnold refused him very harshly, upon which the Bishop retired, and immediately sent a circular to the principal Irish bishops, calling on them to defend the rights of the Church and their ecclesiastical privileges. The affair had now acquired such importance, that it was deemed necessary to call a Parliament upon the subject. It may help to give us some notion of the state of Ireland at the time, to learn that the Bishop inserts among his grievances the hardships and dangers to which he was exposed on the road between Kilkenny and Dublin, having been compelled to make a circuit through mountainous and desert places (*per loca deserta, montuosa et invia,*) to avoid passing through the county of Carlow, which formed part of the Palatinate subject to his enemy, the Lord Arnold. Incidentally we learn that the Bishop travelled through the counties of Wexford and Wicklow, and that the road was almost impassable from bogs and forests.

In the Parliament at Dublin the prelates at first showed some disposition to yield to the powerful lords of the Palatinate, but when Bishop Ledred detailed the circumstances of his imprisonment, they unanimously denounced Lord Arnold as a profane tyrant; he was forced to beg the prelate's pardon, and to promise that he would no longer interfere with the course of justice against heretics and sorcerers. Acts of accusation were renewed against Dame Alice Ketler and her supposed accomplices, but they were all secretly removed into some distant part of Ireland, except Petronilla de Midia, who was convicted of heresy and sorcery, and sentenced to be burned alive. The record states that this unhappy woman was six times scourged before she could be tortured into confession (*sex vicibus per episcopum pro suis sortilegiis fustigata*), and her behaviour at the stake showed that her previous torments had deprived her of reason. William Outlaw was at the same time arrested and confined, heavily chained, in the castle of Kilkenny; under these circumstances he submitted himself entirely to the Bishop's pleasure, and obtained absolution on condition of ceding certain rich endowments to the Church, and going on a pilgrimage to the Holy Land. A clause, however, was inserted, allowing the pilgrimage to be commuted for a sum of money, which we find was subsequently paid, and thenceforward we hear nothing more of William Outlaw or Dame Alice Ketler.

The Bishop's vengeance was next directed against the Lord Arnold de la Poer, whom he charged with heresy. Arnold appealed to the Lord Chancellor, who was also the Lord Deputy, and when this high personage seemed disposed to favour the accused, the undaunted prelate extended the charge to the Lord Deputy himself. All the business of the State was interrupted by this extraordinary proceeding; the functions of the executive were suspended, the proceedings of parliament and of the law court were stopped until the Church had pronounced judgment upon the head of the state. Whilst the civil government was thus in abeyance, the Lord Deputy, on the requisition of Bishop Ledred, had to issue the writ *de excommunicato capiendo* against the Lord Arnold de la Poer, and this unfortunate nobleman died in the dungeon to which he was consigned by his remorseless enemy. Persecution was extended to his senseless remains; as he had not received absolution, Bishop Ledred, inaccessible to the weakness of humanity, condemned the body to exposure, until the progress of decay had rendered interment indispensable. The Lord Deputy, however, had the good fortune to triumph; he was acquitted, and pronounced a true son of the Church; but the Bishop avenged his disappointment by an appeal to Rome, where his representations procured a papal brief, addressed to the King, desiring that he would issue an order to his chief governor and other officers of state in Ireland, to assist the Bishop of Ossory and his brother prelates in the extirpation of heresy.

The very first sufferer from this brief was the Bishop of Ossory himself; he was accused of heresy by his metropolitan, Alexander Bicknor, Archbishop of Dublin, and on his escaping beyond sea, to avoid a trial, his temporalities were sequestered by the crown. After having lived nine years in banishment he was permitted to return to his see; but in a few months his temporalities were again seized, because that he had unjustly excommunicated the Lord Treasurer of Ireland, insulted the Chief Justice of the Common Pleas in open court, and instigated Thomas Fitz-gilbert to set fire to the castle of Moycobin, and murder its proprietor, Hugh le Poer. When brought to trial on these charges, he pleaded the king's pardon, but this was subsequently revoked, on the plea that it had been obtained by fraud and misrepresentation. He was, however, again received into favour, and the closing years of his troubled life were spent in ornamenting his cathedral.

Reflections on this strange narrative will so naturally suggest themselves to the reader, that we need not add many observations. We cannot, however, avoid remarking the exorbitant power which the recognition of Ireland as a papal grant threw into the hands of the Irish prelates during the continuance of the Plantagenet dynasty; Ireland was, in fact, governed by England for Rome. In every difficulty the English monarchs sought the assistance of the Vatican and the intervention of the Church; it was a necessary consequence that churchmen, called on to perform the functions of statesmen, clung to the political power with which they had been unwisely invested, used it for the benefit of themselves and their order, employed the terrors of the next world to forward selfish interests in this, and made heresy a pretext to gratify sordid cupidity or splenetic vengeance.

Lecture on the Systems of Church Architecture —[Vorlesung über die Systeme des Kirchenbaues]. By Dr. Frank Kugler, Professor of the Royal Academy of Arts at Berlin.

ONE of the most interesting lectures delivered this year at the "Wissenschaftliche Verein" (Scientific Association) of Berlin, was that of Prof. Kugler on Church Architecture. This has since been printed, and we shall endeavour to give a slight outline of its contents. The name of Professor Kugler is so favourably known to the English public, that his speculations on this subject will, we are convinced, command attention.

There are, says Dr. Kugler, two distinct theories as to Architecture; one of which regards all that distant ages and countries have produced as wholly foreign and inapplicable to the tastes and wants of the present age, and seeks to create something perfectly new and original; the other pays implicit obedience to the laws established by antiquity, and maintains that the powers of the artist will always find sufficient scope and exercise in the application of those laws. The followers of this system either choose some particular style—as the Greek—to which they inflexibly adhere; or they copy different styles according to the character and distinction of the building they have to execute; as, for example a theatre in the Grecian, a church in the Gothic, and so on. The adherent of this system is, however, constantly met by the conditions of time and place, by which all architecture is limited; and consequently can very rarely succeed in rendering his imitation pure.

There is, adds Professor Kugler, a third system. This recognizes certain elementary and necessary laws, which lie at the bottom of all architecture, and have an internal and indestructible life and force, however various the forms under which they develope themselves. The object of the adherent of this system is, to discover and to master this necessary and natural element, and to separate it from all the local and historical peculiarities with which it is found combined. To one imbued with this view of the subject, there is no style of architecture, however rude or fantastic, which may not suggest useful and applicable ideas. Instead of servilely imitating particular models, he will endeavour to work out these fundamental elements according to the bent of his own genius and the conditions by which he is restrained. He will thus have secured a firm basis of laws and principles, without the fear of becoming a mere copier. Dr. Kugler proceeds to apply this last theory to Church Architecture:—

For centuries (says he) have the nations of Europe laboured to give to the building dedicated to the worship of God, a character worthy of its destination. They have tried not only to impress on it the stamp of their age and nation, but to make it expressive of its internal significancy.

He gives an analysis of the most characteristic forms. Meanwhile, he says, he must make the following observation:—

Various and diversified as are the styles of architecture, they are all susceptible of a division into two great classes. The characteristic of the one, is

Digitized by Google

simple rows of columns (*der einfacher Säulenbau**), and of the other, the arch (*der Bogenbau*). With the column begins the true vital existence of architecture; with it, an organic life, individually developed, and individually distinct, takes the place of the rigid lifeless mass. Free and daring as human thought starts up the column from the earth; in rhythmical measure, the row of columns rises to meet the pressure of the incumbent architrave. But the architrave is again a rigid motionless mass, however elegant or profuse may be the decorations lavished upon it. The architrave arrests the upward motion of the column, and sets an impassable limit to the aspiring thought. But when the arch takes the place of the architrave, this limit is removed; the ascending motion is no longer interrupted; it separates itself (since it cannot be infinitely prolonged) with elastic force; and at each bound it springs to meet the next point of departure. The arch is the completing, the connecting principle of architecture; in its further developement, it becomes the vaulted or groined roof and the dome, and as such gives to the internal architectonic space, living connexion, regular organization, and free sublime elevation. The simple columnar architecture recurs in every style of antiquity. However grand in detail, however exquisitely perfected by the Greeks, it still invariably marks the limits set to the intellectual aspirations of the ancient world. The few deviations from this form must be regarded only as prophetic indications of a future stage of the human mind. The true and perfect creation of the arch and the vaulted roof belongs to the Christian era, and is fully significant of the new hopes and aspirations which opened upon the human mind.

Dr. Kugler restricts himself to the internal architecture of churches, which, as he says, was necessarily the most important, and determined that of the exterior; since the destination of the building was, to contain the assembled congregation.

The invention of an entirely new system of architecture was not to be expected from the first ages of the Christian church. The natural thing was, to imitate those of the existing buildings which seemed best adapted to the purpose. The temples of antiquity would not do, since the area they inclosed was generally small. The people remained, during the religious ceremonies, in the court of the temple, and hence the skill and genius of the architect were mainly directed to the adornment of the outside. What the temple did not afford, was found in the basilica. These buildings were calculated to contain large assemblies of people; they were used as exchanges for the merchants, and, at the same time, as halls for the public administration of justice. They were to be found in all the Roman cities; Rome itself contained a great many, some of which were decorated with the greatest conceivable magnificence. Unfortunately, nothing but the merest ruins of these edifices have been preserved; but we know, from the writings of contemporaries, that they inclosed an oblong area, with colonnades at the sides, and galleries above; and that, at the end opposite the entrance, there was a large semicircular niche, in which was the seat of the judge. Many of the larger basilicæ were without roofs.

The churches of the early Christians were not only built after the model of the basilica, but bore the same name. The niche containing the seat of the judge, was appropriated to the priest, and thence, to the altar. Deviations from the original form, however, soon arose. The earliest Christian basilicæ, which exist in Rome and Ravenna, show marked departures from the ancient rules of columnar building. The galleries over the colonnades disappeared, and walls occupied their place. This arrangement is wholly *un-antique*. The wall is a load out of all proportion to the supporting columns, and is peculiarly heavy where the columns are surmounted by the straight architrave of the pure antique style. Some early basilicæ of this kind exist in Rome; but by far the greater number have arches instead of the architrave, and those oppose an elastic resistance to the pressure of the wall—*San Paolo fuori le mura*, is one of this number.

The early Christian basilicæ thus exhibit a mixture of new and old. The new element, though it offends against all the strict laws of the antique, contains important and pregnant ideas; the area is enlarged by the omission of the galleries; the arches, which rise above the pillars, produce an impression of movement and force, and stand in harmonious relation to the large arch of the altar-niche, which is invariably surmounted by a half cupola.

But the burden of the wall above the columns is still oppressive, and the flat roof, contrasted with the flexible line of the arcade, is cold and stiff. The beautiful ornaments often bestowed upon it, can give only a decorative impression; they can contribute nothing to the architectonic unity and composure (*Ruhe*). The new elements which appear in the early Christian basilica can be regarded only as the germs of a future architectonic developement.

The basilic style was, for centuries, the prevalent one in the Christian world. It was adopted by all countries, particularly by Germany, where it continued to be in use up to the thirteenth century. Saxony, and especially the countries on the northern skirts of the Hartz, are particularly rich in such remains.† The architectonic details bear the stamp of the peculiar taste of the tribe by whom the building was erected, or of the genius of the time. The figures are stiff or fantastic, grotesque or florid.

The most important modification is the appearance of square pillars instead of round. By the introduction of these, the dissonance between the heavy wall and the supports on which it rests is removed. But the square pillar is without the organic life which gives meaning to the form of the column; it merely opposes mass to mass; and the basilicæ which have only square pillars consequently have a rude and ponderous air: many of this kind are to be seen in the Rhineland. Alternate square and round pillars, with large arches springing from the former, surmounting two smaller ones, are the rarest, as well as the most ingenious device for solving this difficulty. The finest specimen of this is the church of Huyseburg, near Halberstadt. It is of the eleventh century.

Dr. Kugler passes over other remarkable modifications of the basilic style; such as the introduction of the transept, of the raised choir, of the crypt, &c. These he considers as innovations, which, however important they may be in other respects, do not affect the fundamental law of the architectural theory.

In the eleventh and twelfth centuries another change was introduced, so prolific in results, that it gave rise to a new architectonic system. This was the application of the arched, or vaulted, roof; the form of which had the same principle of organization, and of elastic motion, which we have before alluded to. The arches springing transversely from side to side, lead the eye at once upwards and forwards. The roof thus lost its inflexible character; the sides of the building were united to each other, and elevation, solemnity, and life were at once given to the building. We cannot follow out all the steps by which this change led to others; *e. g.* to the introduction of pilasters, &c. by which, Dr. Kugler says, one uniform and harmonious vital principle seemed to arise from the earth, and mounting upwards, along the walls and pillars, to attain its full and majestic completion in the vaulted roof. The author mentions the cathedral of Speyer as the one in which the fundamental idea of the arched or vaulted basilica is the most grandly and distinctly displayed.

This style has been commonly designated by the inappropriate name of the Byzantine, which has lately been abandoned for the more appropriate one of the Roman. It flourished, as we have said, in the eleventh and twelfth centuries.

In the thirteenth century the so-called Gothic style first appeared. The broken or pointed arch by which it is characterized, Dr. Kugler believes to be of Saracenic origin. The earliest specimens of it, in churches, are found in Sicily, so long subject to the Arabs. The introduction of the pointed arch was of course followed by a corresponding change in all the other details of the building. We shall not attempt to follow out the historical transition. A more interesting point of view under which to regard it, is the purely æsthetical one. It is its æsthetical character and significancy that gives to Gothic architecture its high perfection.

In the vaulted or domed basilica, which undoubtedly formed the groundwork of the Gothic style, we still find the rigid mass of the square pillar and of the wall, to which the more animated organic parts were attached. The main forms were all massive and ponderous. All these masses now fell into organic members, instinct with life and motion. Clusters of pillars and pilasters sprang from the earth like a living fountain, whose graceful curves met in rhythmical cadence, and with unerring precision. It climbed every wall and radiated in every direction across the vaulted roof. The whole internal architecture was one expression of strength and motion; it drew the senses and the soul of the spectator involuntarily upwards, and yet, through the whole, reigned that perfect proportion, which united to motion the sublimest serenity, and to strength the noblest majesty. The building which surrounded the assembled worshippers was the immediate expression of the act which they met to perform: it was a thousand-voiced hymn of prayer and adoration.

The example of this style, quoted by Dr. Kugler, is the Cathedral of Cologne, which certainly justifies all the poetry of his description. But we do not remember to have seen a church that produced on our minds such an immediate, strong, and permanent impression of an harmonious organic whole, as the comparatively small Cathedral of Coutances. This exquisite building is evidently the conception of one mind; one idea reigns throughout. Certain beautiful architectonic thoughts and phrases recur, like the burden of a song, or rather like oft-repeated echoes. The admirers of the colossal, or of the highly ornate, will be disappointed if they visit it upon our recommendation; but those who look for consummate beauty of conception and proportion will not.

To return to our author. The Gothic style, he says, lasted only a few centuries. The age of the revival of science destroyed its sway: it destroyed not only that which, as to form, may be called the peculiar expression of the taste of the Middle Ages, but also the entire law, according to which a completely symmetrical and significant architectonic whole had risen into existence. The fantastic element, which was inherent in the Gothic style, had sometimes been pushed to extravagance; and the world, surfeited of it, now demanded simplicity and clearness. It found them in the works of classical antiquity, to which the literary tendencies of the age also inclined. Men tried to re-introduce the antique; they created a learned architecture. But the classical forms seldom corresponded

* *Säule* is applied only to the round pillar or column; *Pfeiler*, as we shall soon see, to the square pillar. Our word *pillar*, which is used indiscriminately, therefore, represents neither with accuracy.

† Examples of this are, the churches of St. Wipert, at Quedlinburg, the convent of Grüningen, Gernrode, Frose, Huyseburg, and of St. Mary, at Magdeburg. See 'Kirchliche Kunst-Archäologie des Mittelalters,' by Heinrich Otte.

Digitized by Google

to the conditions of church architecture. The works of this time are mere returns to the arched basilica, either in the Roman, or the properly so called Byzantine, style; with the architrave and frieze prescribed by the classical rules, and with more or less of decoration. They were bastard productions, like those of ancient Roman art. St. Peter's at Rome is the great type of this modern ecclesiastical architecture; it doubtless imposes by the vastness of its dimensions and the grandeur of its proportions: but in no degree by a conformation inspired with life and harmonious meaning. In this state has church architecture remained for centuries, with unimportant variations; such, for example, as the tasteless and unmeaning scrolls and flourishes of the former half of the last century, which only deserve notice as an indication of a decided demand for more richness and variety of form, which this style was a tasteless and grotesque endeavour to satisfy.

Dr. Kugler concludes his interesting address with reminding his hearers how impossible it had been for him, in the short space of an hour, to touch upon any of the numerous less important modifications of church architecture to which fifteen centuries had given birth:—"This rich legacy of ages," says he, "lies before us. The whole secret of rendering it available to ourselves, lies in this,—that we know how to discriminate the general æsthetical principles from the local and historical peculiarities—from the character of the prevailing taste in which they are clothed. However intimately they may be blended, it is possible to gain a distinct perception of the two-fold language of architectural monuments. This is the great charm of the history of architecture,—that it places before us the emblems of past times, with all their characteristic peculiarities, while it unfolds to us the purely ideal laws of form, freed from all the accidents of time and place. If we wish to establish modern church architecture on any fixed and clear principles, we must not adopt any one existing system for imitation or adaptation; but, out of the whole sum of our observations, endeavour to evolve those general laws of form, which may impart to our religious buildings the living and solemn rhythmical sublimity which ought to characterize them. We shall thus get possession of that positive and rudimental substratum upon which the artist may impress the stamp of our age—of our thoughts, feelings, and habits."

Our extremely slight and hasty account of Professor Kugler's Lecture may, at least, give our readers an idea of the sort of lectures delivered at the institution which arose in Berlin in 1841, and which owed its birth, mainly, to Professor von Raumer. Struck with the popular lectures delivered in London, to audiences of both sexes, he laboured with success to introduce a similar practice in Berlin. Whether it will take root and flourish there, remains to be seen. It is difficult to transplant a small twig of the great, and wide-spreading, and sturdy tree of *free public speaking* to a soil where it is neither fed by dews from above, nor nourished from the earth beneath. In England, where the branches overshadow the whole land, and the roots strike down deep into the soil, popular lectures are but one of the thousand expressions of one mighty fact—that matters which concern all, may be handled and heard by all. They are even among the least important of these expressions; but they are something, and the introduction of them is to be counted among Herr von Raumer's merits as a citizen. We confess our small taste for such a mode of instruction; but, in Berlin, they are a valuable and important innovation. Among the subjects treated this year, were, the Statistics of Berlin; the Architecture of Roman houses; the legal condition of women (a subject far too wide for an hour's discourse, and not to be dismissed with a few trivial jokes); the manufacture of glass; the life of Placcius the Reformer; the introduction of exotic trees and flowers, by the amiable and venerable Professor Link; the poetry of Brittany; a portion of Prussian history; and some others.

The other and more important information which our readers may glean, is, as to the German mode of viewing and treating questions relating to Art, in which we are as far behind them, as they are behind us in the conception and feeling of a genuine, vigorous *Public Life*. With few exceptions, what appears in England on such subjects, is calculated to excite scarcely any other feeling in Germany but wonder. We speak more especially of the æsthetical, and not the historical side of these subjects. With Germans, poetical and philosophical speculation does not injure substantial and profound learning. We doubt, for example, whether all Germany could produce a writer, of the smallest eminence, who would talk, like M. de Chateaubriand, of "cette basilique gothique." This, which is a trifle of every day occurrence in France, would be a serious disgrace in Germany.

We cannot dismiss the subject without mentioning two buildings which appear to us (whatever be their architectonic irregularities, of which we are no judge) to show the practical effect of such speculations as the foregoing. We mean the Theatre, and the Jews' Synagogue, at Dresden; both the work of Professor Semper, of that city. They have this in common,—that it is impossible to mistake their destination. How often has one to inquire, Is that building a palace, or a museum—a town-hall, or a church—a theatre, or an hospital? Now none but the most inapprehensive observer need ask, or doubt, the purpose of the Dresden Theatre. It is altogether *public* and *festive*. Still more were we struck with the felicity with which the architect has hit upon the appropriate forms of a Jewish temple. You see that it is a place of worship, yet not a Christian Church; it is Oriental, yet not Saracenic. It is difficult to define, without going into an analysis of the details, in what resides the peculiar and distinctive character of the building, or what makes the singular and fitting impression. Such creations seem to us to indicate true genius;—or, in other words, imagination informed by science, refined and corrected by reflection. It is a shame to mention the Dresden Theatre without noticing the works of Professor Semper's worthy *collaborateur*, Rietschell—a sculptor of whose high merits far too little is known, except to Rauch, whom we heard launch forth in enthusiastic and generous praises of his former pupil, worthy of his own undisputed supremacy. But we are wandering far from our text, and must have done.

The Psalmists of Britain.—Records, Biographical and Literary, &c. By John Holland.
[Second Notice.]

WE were obliged, in closing our notice of the first volume, to turn away from such honoured names even as Sandys, Herbert, and Wotton. In opening the second, we fall on one little less noticeable, that of George Wither, which we must also leave, with a very few words; though if we followed out Mr. Knight's plan of biographical speculation, we could fill volumes with the Puritan psalmist's history, telling how "he employed his poetical vein in severe pasquils on the court and clergy,"—how he was appointed by Old Noll one of his provincial major-generals,—and how, after the Restoration, on recommencing his trade of satirist, he was "clapt up" in prison, where he died. There is something of the sharp tongue of the controversialist in the version of the Fifty-seventh Psalm, given by Mr. Holland—*e.g.* the following stanza:—

> From their despights who seek to rend mee,
> Let help, oh Lord, from heaven be daigned,
> And let thy Truth and Love defend me;
> For, I with Lions am detained:
> With men inflam'd, whose biting words
> Are shafts, and spears, and naked swords.

We cannot but believe that our author has particular sympathy with the Withers of song, since, after a copious notice of this busy and restless politician, come two very meagre pages devoted to singers far more interesting—the quaint Crashaw and the resonant Phineas Fletcher. Mr. Holland wakens up again at the name of Zachary Boyd. This was one of the tough and learned old Scottish divines, under whose ministry sprung up the Mause Headriggs and Jenny Geddes. Boyd "so boldly inveighed against Cromwell to his face, in the cathedral of Glasgow, that Thurloe, the secretary, proposed to 'pistol the preacher' there and then." He, however, seems to have been more uncompromising than tuneful: nothing *in lengths*—we will not say *rhyme*—can be much less poetical than the version of the Hundred and Thirty-eighth Psalm, given from his collection; which was, nevertheless, officially recommended for popular use by the General Assembly of the Kirk in 1647. Good Bishop Hall, who comes next on Mr. Holland's list, is a very "swan of Pindus" in comparison with Boyd; and Rouse, whose version was really adopted by the Calvinistic body—the Scottish Psalter being even now based upon it,—though rugged, is still comparatively sonorous and poetical, and worthy of Dr. Johnson's praise of "*unction*" and "simplicity," if we are to judge from the specimen here cited. An anecdote has been related in proof of the influence exercised by this psalmist over no less a personage than the Protector, to whose Council he belonged:—

"The Rev. John Ward, of Stratford-on-Avon, who died about 1680, records in one of his Common Place Books, lately published, the following anecdote of Rouse:—Mr. Dod told mee this storie: the business of tithes in the Protector's time being once hotly agitated in the Council, Mr. Rouse stood upp, and bespake them thus: 'Gentlemen,' says hee, 'I'll tell you a storie; being travelling in Germany, my boot in a place being torne, I staid to have it mended, and then came to me a very ingenious man and mended itt; I staying the Lord's day in that place, saw one who came upp to preach who was very like the man that mended my boot; I enquired and found it was hee. Itt grievd mee much. They told me they had tithes formerly; but now being taken away, the minister was fain to take any employment on him to get a living.' I heard the storie turned the Protector, and he presently cried out, 'well, they shall never mend shoes while I live.'"

Our pleasant collector seems almost afraid of the next sacred poet on his list—JOHN MILTON; and his modesty is "of grace," though tending to make his record disproportioned. If we imitate Mr. Holland's forbearance, it is, of necessity, even more than reverence. After so much that is dry and crabbed, "of the earth, earthy," we feel as if raised to—

> An ampler æther, a diviner air,

when we come to such a strain of organ music as the following verses:—

> To God our strength sing loud and *clear*,
> Sing loud to God *our King*;
> To Jacob's God, *that all may hear*
> Loud acclamations ring.
>
> Prepare a hymn, prepare a song,
> The timbrel hither bring;
> The *cheerful* psaltery bring along,
> And harp *with* pleasant *string*.
>
> Blow, *as is wont*, in the new moon,
> With trumpets' *lofty sound*,
> The appointed time, the day whereon
> Our solemn feast *comes round*.

Without compromising himself, Mr. Holland might have stated more explicitly Milton's

Digitized by Google

musical accomplishments as among his requisites for giving a noble version of David's Psalms. He did more than *love* "the pealing organ"; his hand knew its stops, and could make its keys discourse rarely: a notable example that Legitimacy does not monopolize all grace, accomplishment, and poesy, as some have dreamed, and would fain, even in this day, teach. But we must stop, and be contented to dwindle from the "poet blind yet bold" to Sir William Mure,—the nephew of the Alexander Montgomerie, the poet of 'The Cherry and the Slae,'—a pedantic and pious Scot, who showed more taste, it is to be hoped, in building and planting round his mansion house of Rowallan, than he exhibits as a psalm singer. What, for instance, could better serve as foil to Milton's verses than the following quatrain?—

> Tranquillite, and welfare have
> They; Peace be in thy fort;
> Prosperitie thy Palices
> May fill above report.

Perhaps it is the high company we have been keeping, only for a passing moment, which makes us indifferent and fastidious; at all events, we must pass some four or five very uninteresting rhymesters to mention the name of Mary Beale. This is full of interest to the historians of Art. She was a paintress,—the paintress of poets, since Flatman sat to her for his portrait, and Woodford addressed verses to "this absolute gentlewoman" under the fantastic name of Belisa. She is said, moreover, to have been handsome, modest, and intelligent; and Mr. Holland departs most ungallantly from his own standard of judgment, when he hints that her graces and gifts blinded her friends to the absence of poetical qualities, as the most superficial critic must admit, who compares her version of the Seventieth Psalm with some of the essays of her contemporaries and predecessors. We will make room for a single verse, to justify our praise.

> But on Thy People make Thy Face to shine!
> Let them from fears be always free,
> (Except it be fears of offending Thee)
> The sacred Flame their heart shall so refine,
> That now their joy shall only be that they are Thine!

This is, surely, "musical as Apollo's lute," if measured against the last four lines extracted.

We must be more rapid in dealing with the throng of poets who remain to be noticed. In alluding to Lord Coleraine's 'Ascents of the Soul,' one of those geometrically symmetrical versions which the foppish taste of our ancestors encouraged, Mr. Holland goes beyond his depth, in his note on the Italian psalmists, by dragging in the name of Benedetto Marcello, and asserting, in a sweeping fashion, that the immortal '*Salmi*' of that noble and accomplished musician (an honour to the Golden Book of Venice!) were "never heard in any one of the churches of Italy." He is more at home with "precious Mr. Richard Baxter and dame Bridget Bendish, the grand-daughter of Cromwell, who frequently came to visit her friends at nine or ten o'clock at night, or later; and 'about one in the morning used to put herself on the top of her mare, and set off, singing a Psalm or one of Watts's hymns, in a very loud but not a very harmonious key.'"

Mr. Holland, too, has collected, seemingly with care, the history of the monotonous but useful version by Tate and Brady. Coming to the more poetical paraphrases of Sir Richard Blackmore, he endeavours to raise the physician-poet from the low estate to which he was abased by the scorn of Pope and Dryden. Our author is still more at home with Watts, Wesley, Simon Brown, Mrs. Anne Steele, and the other Dissenting poets who have employed the Harp of David in the service of the Tabernacle. As we draw nearer our own times we come among "the minnows" with a vengeance. One of Lord Byron's 'Hebrew Melodies,' however, is wrested from its place, that the shell of the Triton may not be wanting. We must add, that Mr. Holland is hardly to be trusted with his contemporaries, the amiable desire to give pleasure and praise often misleading his judgment. The historian, above all men, must be clear-sighted, and sharp-sighted, or he may mistake the Slough of Despond for faëryland, and the lamp of *ignis fatuus* for a star dropped from heaven. Here, then, we shall do wisely to leave his book, recommending it as a curious and ingeniously selected miscellany, which churchman or dissenter, priest or layman, musician or rhymester, may be glad to add to his library.

The Mutual Influence of Morals and Legislation —[*De l'Influence des Mœurs sur les Lois, &c.*] By M. J. Matter. Paris, Didot.

"Custom," says Lord Bacon, "is the principal magistrate of man's life; for commonwealths and good governments do nourish virtues grown, but do not much mend the seeds." It is not the least perplexing of the problems which in our day occupy the attention of the statesman and the moralist, to discover the causes that have weakened the magisterial influence of custom, and gone far to destroy reverence for ancient usages in every country throughout Christendom. A similar problem was presented to the philosophers of ancient Greece, when its several republics began to be absorbed in the Macedonian monarchy; Aristotle applied the powers of his mighty mind to its solution, and has given us the result in his Politics, which must ever be a text-book for those who study the connexion between public government and public morality. It is a singular phase in this discussion, that the more frequently it has been examined the more apparent has become the necessity of going back to first principles, and examining their operations more as statisticians than as philosophers; that is to say, with a purpose rather to collect facts of concomitancy than to establish principles of causation. It is useless to inquire whether governments exist by divine right or by some species of compact between the rulers and the people; but it is of the highest importance to determine what were the practical means by which all ruling powers, —whatever may have been their varied political denominations,—established and maintained their ascendancy, even when the most obvious imperfections and vices were manifested in their constitution. This problem lies at the very threshold of our inquiry, but fortunately the solution requires but little of laboured research or argument.

When Napoleon declared that the stomach was the moving power of the political world, he merely gave point to one of those neglected truths which lie on the surface of all history, but which no one stops to examine, because they are so easy to be picked up. There are historians and geologists who waste their time in hunting for cabinet specimens, forgetting that it is much easier to determine the strata of a country by the broken stones on the road.

In every age the ruling power in a state has set forth as its claim to obedience that it is "the feeder of the people": as such it has assumed to itself the property in land, and though it never has gone so far as to deny that this possession of land is in name a stewardship, yet it has invariably sought to render landed property the most absolute of any. We see this principle very strongly set forth in the Jewish Theocracy; God is constantly set before his chosen people as the great proprietor of Palestine, and the "feeder" of the Hebrew nation. "It is the land which the Lord thy God gave unto thee" is constantly assigned as the reason for the two-fold tithe which the Hebrews as well as the Egyptians were bound to pay; and on no attribute of Deity do the sacred prophets and poets dwell with more force and beauty, than His pastoral protection of his people as a flock: "The Lord is my shepherd, I shall not want." When the prophet Samuel endeavoured to dissuade the Hebrews from electing a king, we find him dwelling particularly on the change which the substitution of monarchy for theocracy would produce in the tenure of land: "he will take your fields, and your vineyards, and your olive-yards, even the best of them, and give them to his servants."

In ancient Greece, land was the property of a tribe, and the entire system of legislation was directed against the transference of this possession to aliens. Among the Spartans, none but members of the ruling tribe could become landowners, and hence the pure Spartans were enabled during a long course of centuries, to maintain an unbroken ascendancy over all the other tribes of Laconia, whom in fact they treated as slaves. But in Roman history the connexion between aristocratic power and the supply of food to the people is still more apparent, not merely in the many contests on the agrarian laws, but also in the avowed determination of many patricians when corn was imported, to affix such conditions to its sale and distribution as would establish their absolute supremacy over the plebeians. Coming to a later age we find all the institutions of feudalism curiously contrived to place all the means for the production of food under the absolute control of the feudal nobility, and acting on the principle that the landed aristocracy must be the predominant political power, because it is "the feeding aristocracy," in consequence of its monopoly of land. This dependency upon the ruling powers for the means of subsistence produces habits of subordination and dependence, which are strong in proportion to the amount of control that the ruling body can exercise over the supply of food. A nation such as Poland and Russia, entirely dependent for food on its native lords, must soon be reduced to the condition of serfs to these lords, and can possess no internal means for effecting their emancipation. An aristocracy of land would be as irresistible in Europe, as a despotism of land is in Asia, but for the application of industry to employments unconnected with the culture of the soil, and the power of purchasing nutriment of foreign growth by the produce of this industry. So far is it from a political disadvantage for a nation to be in some degree dependent upon foreigners, that without such dependence the existence of civil liberty would be perhaps impossible.

And here we may remark on the latent fallacy in the hackneyed phrase "Do not become dependent upon foreigners," as if foreigners could at their own pleasure give or withhold the commodities which we require. A nation, when dependent for supplies on foreign produce, does not at the same time become dependent upon the foreign producers, but it does become dependent on the skill and industry of its own manufacturers, on the wisdom and enterprise of its own merchants. Seeds are planted for us by the spindles of Manchester, and harvests reaped in the ledgers of Liverpool.

This economic revolution, which is not confined to England, but is spreading very rapidly over the continent, has not merely changed the relations of demand and supply, but has worked out new habits, new manners and new customs, some of which have not yet been brought into strict conformity with the old code of morals, and all of which are more or less inconsistent with such of our laws as are founded on the more antiquated portions of that code. The amazing development of mechanical skill and manufacturing

Digitized by Google

interest, reciprocating with an extent of commerce, to the increase of which, if left to its free natural growth, no man can assign limits, must of necessity produce new habits of thought and action inconsistent with ancient usages and existing laws, and provide many years of employment for the moralist and the legislator in reconciling the discrepancies. We have only indicated a few of the causes, which render the examination of the relations between morality and law a task of the highest importance, if not of prime necessity at the present moment, and shall now endeavour to remove some of the difficulties which beset the investigation of this important subject.

Properly speaking, customs, or manners, and morals, mean one and the same thing: the Greeks and Romans had but one name for both; so that when they called an action "moral," they meant nothing more than that it was conformable to the manners of their age and nation. We, however, generally recognize some code of morality, absolute and permanent, not only independent of the fleeting manners of the day, but to which, as a standard, we frequently refer our conventional rules, and test their propriety. In fact, we may define the moral code to be a collection of those rules of life which arise from a just perception of right and wrong; and manners to be the application of these rules as modified by the varying circumstances of humanity. M. Matter devotes a considerable space to investigating the primary nature of the moral sense, or the faculty of discriminating between right and wrong. It is quite sufficient for our purpose to state, that no nation has ever been found, in which a distinction between right and wrong has not been recognized, though opinions have greatly varied as to what actions were right, or what actions were wrong. Whether the moral sense be an original faculty, or whether it be a result of the perceptive and reflective faculties, it is clear that its practical importance is entirely based upon the perfection with which it performs its specific function—the discrimination between what is right and what is wrong. In other words, it depends upon the general intelligence to discover what is really right and what is really wrong, before the moral sense can exercise its function of discrimination between them.

Laws are usually deemed to hold the same relation to society and social action that the moral code does to individuals and individual action; they are supposed to enjoin what is right and prohibit what is wrong, the legislator exercising his discriminating power as the representative of the moral sense of the community. Were this task faithfully executed with all the attainable knowledge of what is essentially right and what is essentially wrong, morality and legality would be one and the same thing; whereas nothing is more common than to hear actions which are perfectly legal, condemned by public opinion as decidedly immoral. There is, indeed, a very sad, but a very notorious possibility, that the manners of a country may be very far behind the recognized principles of public morality in that country, as is evinced by the existence of slavery in America and duelling in England; but there is a far greater possibility of the laws of the country remaining far in the rear of its manners or embodied moral sense, as was the case when, in consequence of the severities of our criminal code, aggrieved parties refused to prosecute, witnesses to give testimony, or juries to convict. Each of these discrepancies has its own attendant dangers; when public manners are at variance with the recognized principles of public morality, a spirit of reckless desperation is produced, which sets all public order at defiance, for men are certain to set themselves against reason, when they see that reason is clearly set against them. When the laws are based on notions of right and wrong, exploded by the advanced intelligence of the community, the moral sense of the individual revolts against them—physical force becomes the only means of procuring obedience; while the adoption of the coercive course by the ruling power, is regarded by the subject not merely as a confession, but as an avowal of some immoral purpose.

Morals, manners, institutions, and laws, have but one common object—the establishment of right and the prevention of wrong: the perfection of all and each depends upon the same principle—the clearness with which the essentially right and the essentially wrong are seen and discriminated. It is commonly said by political writers, that the individual code of morality must always be more pure and perfect than the public code, because interests of class, circumstance, and position, must be expected to act as perturbating forces on the minds of legislators. To a certain extent this may be true; but it needs little argument to show that any large discrepancy between the codes of private and public morality, is fraught with serious danger; and that to keep them in harmony is the first duty, and, we may add, the highest privilege, of an enlightened statesman.

M. Matter seems to entertain some misgivings on the subject of legislation, arising from what he justly regards as a new duty devolving upon statesmen—the promotion of the physical comforts of the people, as well as their social advancement. In this new duty, now beginning to be generally recognized, we see the strongest grounds for hope. The history of commercial and manufacturing industry has been written in vain, if men have not by this time discovered that the spirit of selfish rapacity and exclusive gain is certain to be fatal to both. It was not the discovery of the passage to India by the Cape of Good Hope which ruined the Oriental commerce of the Venetians; there was nothing to hinder their galleys from following in the track of Vasco de Gama, as did the ships of Holland and of England,—the ruin of the Republic was its attempt to retain a monopoly, against which Europe had long protested, and panted for an opportunity to shake off. Our author seems to be daunted by the frequent manifestations of blind selfishness, by certain vested and protected interests in France; but he cannot have missed discovering that an improved spirit is fast extending in that country, and that its merchants have discovered that a fair interchange of commodities is equally profitable to the buyer and the seller. While, therefore, we confess with him, that the history of commercial laws in the European nations is a lamentable record of perverse and immoral legislation, we look confidently forward to the extension of commerce for the establishment of right principle.

M. Matter, in the conclusion of his volume, dwells strongly on the importance of national education, as a means for bringing about the desirable connexion between morals and legislation. He says, with truth, that an enlightened people will not tolerate an immoral government; but it is desirable to add, that an enlightened people will only have recourse to moral means in order to ameliorate its government, and will not commence its labours for reconciling public with private morality by acts of outrage, which violate both. We share in the hopes, or rather the anticipations, of M. Matter, that a new era is about to open on humanity, in which morality will be recognized as the true foundation of policy, in which nothing will be valued that is not right, and nothing honoured that is not just.

A Treatise against Dicing, Dancing, Plays, and Interludes. By John Northbrooke, Minister. Reprinted for the Shakespeare Society.

THE editor of this reprint, Mr. Collier, justly observes in the introduction, that such works are importantly illustrative of the condition and history of the stage, and of the nature and character of the pieces exhibited, only a few years before our great dramatist joined a theatrical company in London. The title-page is dateless, a common omission of the time, but the tract was entered at Stationers' Hall in 1577, so that the date of its appearance is known with sufficient exactness. The writer was one of the earliest puritanical pamphleteers; he subscribes himself to the dedication John Northbrooke, Preacher, and in another place assumes the appellation of "Gospeller." Curiously enough, as the editor observes, the denouncer of plays and interludes adopts a dramatic form to communicate his opinions. The tract consists of a dialogue between Youth and Age,—"the first a very misguided, but extremely docile and easily convinced pupil, and the last a very learned, patient, and pious man, who has innumerable texts at his fingers' ends, and is extremely well versed in the fathers and early divines."

Dialogue has been highly commended as an advantageous method of teaching, eminently adapted to the full discussion of moral questions. Shaftesbury is of course an advocate for this method of instruction, as particularly favourable to the application of his theory of ridicule. He observes that "without wit and humour, reason can hardly have its proof, or be distinguished. The magisterial voice, and high strain of the pedagogue command reverence and awe. 'Tis of admirable use to keep understandings at a distance, and out of reach. The other manner, on the contrary, gives the fairest hold, and suffers an antagonist to use his full strength hand to hand, and upon even ground." But this is obviously as superficial as the greater part of the opinions in the Characteristics. It assumes that in works written dialogue-wise the parties who converse are in reality different persons; as if it were not the author himself who managed the whole debate. A candid writer will of course "suffer his imaginary antagonist to use his full strength," but such a writer would not in any style of composition adopt the "high strain of the pedagogue, to keep understandings at a distance, and out of reach." If a man have the mind of a pedagogue, he will argue like a pedagogue, although he may choose to couch his dogmatism in the shape of a conversation between Theocles and Palamon, or Eudoxus and Philalethes. Fairly used, the dialogue has its advantages in opening out certain branches of knowledge; but it is no security whatever against "the magisterial voice," and dictatorial fallacies; the master has only to provide himself with "an extremely docile and easily convinced pupil," like Youth in the treatise of John Northbrooke. To one class of fallacies, the conversational form appears particularly subject, or we should rather say that it affords them the most commodious shelter; namely, those that spring from the mere "suppressio veri." The dialogue conveys an idea to the reader that he hears both sides of the question fairly stated and fully discussed, whereas there is nothing easier than to make Palamon feeble, loose, blunt, and illogical, while Theocles avails himself of the best points, puts them in the strongest manner, gains credit with the reader by exposing the sophisms or ridiculing the weakness of his fictitious adversary, and uses every art of rhetoric and dialectics to set off his cause and bear away the victory.

We have a good illustration of these remarks

Digitized by Google

in the curious and pedantic dialogue before us. "Age" holds forth against the stage, armed at all points with tomes of divinity, and scriptural evidences, and citations from classic authors; while "Youth," the respondent, (as is to be expected from a school-boy,) makes no stand whatsoever, or the feeblest replies that can be imagined. A specimen or two will not be unentertaining:—

"*Youth.* I haue hearde say that one Plautus, a comicall poet, spent all his substance vpon players' garments; also one Roscius, a Romane and a player in comedies (whom for his excellencie in pronunciation and gesture, noble Cicero called his iewell): the Romaines also gaue him (as hystories reporte) a stipende of one thousand groates for euery daye (which is in our money xvi^{li}. xiij^{s}. iiij^{d}.); Lucius Silla, being Dictatour, gaue him a ring of gold, &c. Sith these, and such other, gaue to such vses, why may we not doe the like?"

Age has no great trouble in demolishing an argument like this. Not satisfied, however, with the obvious answer, he informs his schoolboy antagonist that Plautus "was brought into such poverty that he was fain to serve a baker!"

Another of "Youth's" arguments is this:—

"*Youth.* I maruayle why you do speake against such enterludes and places for playes, seeing that many times they play histories out of the scriptures."

Hereto "Age" replies with a superfluity of learning, and so triumphantly that "Youth" exclaims—

"*Youth.* Now I perceyue it is not good, nor godly haunting of such places."

Shortly after he inquires—

"*Youth.* I pray you, shewe mee from whence those kinde of playes had their beginning, and who deuised them."

—to which grey-beard, following Chrysostom, returns the satisfactory answer,—"the devill founde oute stage-playes first!"

Master Northbrooke, however, stops short of the full puritanical animosity to the drama; he has so much of the old leaven within him as to tolerate the acting of plays in the Universities and Grammar-schools:—

"*Youth.* Before we reason of anye other matter, lette me vnderstande your judgment respecting comedies and suche lyke things, whiche schollars doe many times practise and vse, both in the Universities, and also in diuerse and other good schooles.

"*Age.* Saint Cyprian, wryting unto his friend Euagrius in a certaine epistle, sayth that he is *Doctor, non erudiendorum, sed perdendorum puerorum*, &c. a teacher, not of learning, but of destroying children, which practise them in these enterlude and stage playes; for (sayth he) *Quod male didicit, cæteris quoque insinuat*, that euill which he hath learned, he doth also communicate vnto others, &c. Notwithstanding, you shall vnderstand y^{t} S. Cyprian speaketh of him that did teach and practise onely this kinde of vaine pastimes and playes, and did allure children vp therein. But, to showe you my minde plainlye, I thinke it is lawefull for a schoolmaster to practise his schollers to playe comedies, obseruing these and the like cautions: first, that those comedies which they shall play be not mixed with anye ribaudrie and filthie termes and wordes (which corrupt good manners). Secondly, that it be for learning and vtterance sake, in Latine, and very seldome in Englishe. Thirdly, that they vse not to play commonly and often, but very e rare and seldome. Fourthlye, that they be not pranked and decked vp in gorgious and sumptious apparell in their play. Fiftly, that it be not made a common exercise, publickly, for profit and gaine of money, but for learning and exercise sake. And lastly, that their comedies be not mixte with vaine and wanton toyes of loue. These being obserued I iudge it tollerable for schollers."

As Chrysostom ascribed to the devil the invention of the stage, so St. Cyprian attributed to him the invention of cards, and Northbrooke is of the same opinion. The dialogue on this point is curious, and shows our "Gospeller" and "Preacher" more skilled in such matters than became so godly a man. "Youth" might have picked up a knavish trick or two out of "Age's" invectives, as smugglers are said to learn their trade in the acts of parliament made to prevent smuggling:—

"*Youth.* What say you to carde playing? is that to be vsed and allowed among men?

"*Age.* I tell you plainly, it is euen almost as badde as the other: there is neuer a barrell better herring (as the prouerbe is); yet of the two euils it is somewhat the lesse, for that therein wit is more vsed, and lesse trust in chance and fortune (as they terme it), and yet I say, therein is no laudable studie or good exercise. Dice playing is the mother, and carde playing is the daughter, for they draw both with one string all the followers thereof vnto ydlenesse, loytering, blaspheming, miserie, infamie, shame, penurie, and confusion.

"*Youth.* Is there as much craft and deceit at carde playing, as there is at dice playing?

"*Age.* Almost none; I will not giue a straw to choose: they haue such sleightes in sorting and shuffling of the cardes, playe at what game ye will, all is lost aforehande, especially if two be confederate to cousin the thirde.

"*Youth.* As how, I pray you?

"*Age.* Eyther by pricking of a carde, or pinching of it, cutting at the nicke; eyther by a bumbe carde finely vnder, ouer, or in the middes, &c. and what not to deceyue? And therefore to conclude, I say with that good father, Saint Cyprian, the playe at cardes is an inuention of the deuill, which he found out that he might the easier bring in ydolatrie amongst men. For the kings and coate cardes that we vse nowe, were in olde times the images of idols and false gods which, since they that would seeme christians, haue changed into Charlemaine, Launcelot, Hector, and such lyke names, bicause they would not seeme to imitate their idolatrie therein, and yet maintaine the playe it self, the very inuention of Satan, the deuill, and woulde so disguise this mischeife vnder the cloake of such gaye names."

On the subject of Dancing, too, Age is much warmer than due respect for his young scholar should have made him. There is a good deal which we should not like to quote in this part of the conversation.

OUR LIBRARY TABLE.

The People and the Church of Scotland: a Reply to Sir James Graham and the Government, by J. White, A.M.—We never enter on speculations where immediate party questions are involved, and the harsh, uncharitable tone of this pamphlet is not calculated to tempt us to alter our rule. One view, however, advocated by the author is sufficiently original to interest our readers. "Hence, also, we learn from this subject the degeneracy of the race of man, and the cause of the degeneracy. Hence, moreover, the *breadth* of the head of Henry the Eighth, is much greater than the height. The base of his head, where the selfish—animal resides, is great. Though the top of the head were extended above the cap, the form would not have been fully sufficient to counteract the BASENESS and DEGENERACY OF HIS BIRTH AND FORM, particularly in the position where the governments of men placed him. All selfish and destructive animals are *broader* in the base of the head, contracted or lowered in the forehead. Hence, moreover, the analogy between the form of one animal and another. Hence all selfish and destructive forms of men are *broad headed*. Their element is a selfish society, a selfish government, an unjust state of things, OF WHICH THEY ARE THE FRUITS EITHER OF THE FAMILY IN WHICH THEY ARE BORN, OR OF THE STATE IN WHICH THEY ARE MEMBERS. * * Hence a government that produces *base born* types or forms of man must be bad. Hence if the governments of men only enable such baseborn men as Pope Alexander the Sixth, or Henry the Eighth, or the children of George the Third to come to what is called the top of Society, we are certain that the governments are wicked, working out the degeneracy of man. It belongs therefore to you, the government, to look to yourselves, and particularly to notice the types of man in the House which you call the Lords,—to ascertain the truth of this, for it is your interest to inquire immediately into this national and universal subject—to consider also the general run of the heads of the Commons, for they are evidently steeped in bribery and corruption and money-making on almost any principle—and, third, to examine those men in society who are called men of property—whether speaking *generally* they are not animal men, or broad particularly in the base of the head, or high principally in the crown; for the subject declares that unjust or unequal laws MUST DEGENERATE THE RACE, and that the most base born or degenerate are likely to *rise*—shall we say to the surface of your society—though to *fall* would be the more appropriate expression." "In this," the author tells us, "lies the wisdom and marrow of the subject"; we shall therefore leave it to the judgment of our readers.

Hints from the Journal of an Australian Squatter, edited by H. Caswall.—These Hints contain information which may be valuable to the emigrant, increased by an Appendix, in which the articles essential for his use and comfort are enumerated, and the prices affixed. Mr. Caswall in his introduction advocates three points: First, a fair price of land; second, greater attention to the internal condition of the colonies, by forming roads, canals, &c.; third, increased facilities for emigration. The writer of the Hints complains of the government price of land, which on his arrival at Sydney he found raised from five shillings to twelve shillings an acre, and "was reluctantly obliged to take to the back settlements as a squatter, paying a yearly licence of ten pound." The subject of emigration is necessarily attracting more attention every day, not merely as a speculative question, but as the resource and relief of thousands and tens of thousands—and the latter class may find information worth gleaning from this small work.

Poems, by H. H. Methuen, Esq.—There is a certain glimmer of promise in some of these Poems: but we should have entertained better hopes of the writer's future performances had he not published them.

Moral Strength, or the Nature and Conquest of Evil Habits considered, by Rev. W. Mousley.—The author grounds his hopes of moral improvement, and the formation of good habits, upon religious views, and makes the Bible the only standard of morality, "being fully persuaded that it is only on religious considerations that this subject can be successfully conducted and advantageously applied." We need only add, that Mr. Mousley's volume is free from anything like fanaticism.

Rural Chemistry, by E. Solly, Jun.—An excellent work on a most important and interesting subject. It contains the substance of a series of articles which appeared originally in the *Gardeners' Chronicle*, and excited so much interest and attention that it was thought advisable to republish them in a separate and more complete form. The "object is to give such an elementary sketch of the science as should enable those ignorant of the subject more readily to comprehend the works of the various authors who have written on Agricultural Chemistry."

First Catechism of Geography, by the Rev. T. Wilson.—Very short and very dull.

BRITISH ASSOCIATION.

[We thought it better last week to complete our report of proceedings in the Sections, and to reserve till to-day the address of Dr. Robinson at the close of the meeting, and the report by Prof. Forbes, on the Mollusca and Radiata of the Ægean Sea].

Dr. ROBINSON observed that it had been intended that he should on this, the last evening of the meeting, present to the Association a summary of the sectional proceedings during the week, and under ordinary circumstances he might have been enabled to discharge the task by the help of the secretaries of the Sections. But though this meeting was not so numerously attended as many of those which had preceded it; though circumstances which he deeply regretted had deprived them of the presence of Brisbane, of Brewster, of Fleming; though England had not furnished her full contingent, and some of her greatest names were among the absent; yet were it to be measured by the degree in which it had contributed to advance our great object, none ever was fuller. In the Section to which he peculiarly attached himself, up to the last moment they had been fully occupied; the case was the same, he understood, in the others, and that of Natural History had attained an eminence which it never reached before. Besides the contributions of known and tried members, they had found at Cork a number of intelligent and ardent votaries of science, of whom as he acknowledged with delight the energy and talent, so he hoped that this visit of the Association would not merely be an additional stimulus to them but also a guide, pointing out to them the lines of knowledge where most remains to be explored, and the not less important information of how much has already been achieved. In such a profusion of materials it soon became obvious that to select on any principle of comparative merit was impossible, without far passing the time which they could be expected to bestow; but that he might not be entirely deficient he had chosen from the mass three subjects, to which he would invite their special attention, two entitled to that distinction from their important bearing on the industrial resources of Ireland, the third remarkable, not merely from its relating to his own peculiar pursuit, but also from its being one of the proudest triumphs of mechanical skill and inventive intellect ever won, and as such, a glory to his country.

The first is a method of representing by contour lines on maps, the inequalities of a district's surface, which Capt. Larcom exhibited to the Mathematical Section. He supposed the members were well acquainted with the maps of the Ordnance Survey; of which it might well be said that among such works they stand pre-eminent for the accuracy of the triangulation on which they are founded, and the precision with which its data have been given by the engraver. They however only give their results on one dead level; the altitudes above the sea of a few points on each townland are indeed inserted, but these fail to convey to the mind any distinct conception of the undulations of the ground, much less are they sufficient to guide the operations of the common road maker, or the civil engineer. For obtaining a notion of an uneven surface, some system of relief or shading has always been found necessary, and it has been esteemed as of the utmost importance to give this shading such a definite character that it might serve not merely as an indication but a measure. The officers of the survey appear to have exhausted the subject; and some of the specimens which were submitted to the Section deserve to be brought before you. A model obviously gives a distinctness of conception, and speaks to the eye in a way which no drawing can attain, and can be afforded nearly as cheaply as a map, by forming from it an electrotype concave metallic mould, which serves as a die to stamp paper. The embossed plans so obtained are both beautiful and durable, but have the defect of not affording distinct lines of level, as is done by another kind of model invented by Lieut. Bennet, R.E. Suppose a maritime tract is to be represented. A square of card paper is the sea plane. Conceive now a section of the land made by a horizontal plane at the height of ten feet, it will intersect all that rises above that in a variety of curves whose position and shape are given in the survey. Cut these out in the same card paper, and paste them in their proper places on the base plane. Let another section plane be taken at twenty feet, repeat the cutting out and pasting, and so on. You will now build up in steps a model of the ground, nearly similar to that already spoken of, but every step will give you a levelling in which the thickness of the paper is ten feet of height. If now, looking down on such a model, you conceive the various edges of the papers let down to the base plan and marked there, you will have a contoured map. When the ground rises rapidly, the contour lines will of course be close together, and form a dark shading: when the slope is more gradual they are remote; and even for much greater intervals than ten feet, they show the character of the ground most completely. The value of them is however of a much higher order than this. Suppose for instance it is required to form a road between two places, one 100 feet, the other 300 above the sea, and ten miles asunder. Here besides the power required for the distance, there is also that required to lift the load 200 feet. This will be about $\frac{1}{1000}$ of the other, if the ascent be uniform, and will scarcely affect the transport. But if in reaching the proposed point four or five eminences are surmounted, some perhaps more elevated than the terminus, if instead of shortening the journey by passing them, it is actually increased, there needs no proof of the wasteful expenditure of power, or in other words of capital and industry, which is thus caused, and which, if its monied value were estimated through all Ireland for a year, would be astounding. The same application of it avails, and even more powerfully, for canals and railroads; and it must be a matter of congratulation to those who feel that a perfect internal communication is to a nation the arterial system of its industrial life, carrying throughout the feeling of health, that three of our chief Sections have obtained from the Association an application to government requesting its insertion in the maps of the Ordnance Survey. He had heard at a meeting of the influential inhabitants of Cork, for the purpose of establishing a line of railway to Dublin, from a distinguished engineer, the president of the Mechanical Section, that the information which he then laid before them would have involved an outlay of 2000*l.* but for those maps, even in their present state; and it was easy to estimate how much their worth would be enhanced by the proposed addition.

The second object to which he would invite their attention, was the announcement read to the Mechanical Section, of the successful trial of a new system of railway traction, called the Atmospheric, at Kingstown. They were, of course, all acquainted with the common locomotive engine, a machine which, with all its marvellous results, has many defects. Its weight and fearful momentum require immense strength in the road on which it travels. A slope, which would not check a mail-coach, brings it to a stand. The injury which it receives from its own violent concussions, make its maintenance in action ruinously expensive; its tractive power diminishes rapidly with its speed, so that the latter is limited by necessity, and much more by economy; and too many fatal accidents have shown that, like the demon slave of an Arabian tale, it is ready to destroy its masters. In another system, the train is drawn by a ponderous rope extending miles: its friction and inertia are formidable objections, the attainable speed is still more limited, and the chances of fracture and delay even greater. But in this atmospheric traction the rope is of air, it cannot break; its velocity is practically unlimited, for none will consider as a limit the 600 miles per hour of theory! What difficulties may attend an invention tried for the first time, none can exactly foresee; but two of its advantages are so obvious, as to make this trial one of the greatest interest. From its power of ascending considerable slopes, it will apparently make unnecessary the expensive cuttings, tunnels, viaducts, and embankments, which (especially in a country like Ireland) virtually prohibit the present railroads. The Kingstown apparatus could draw a train of seven tons at fifteen miles per hour on an incline where a locomotive could barely keep stationary its own weight. In the trial, as reported to the Section, when working at half speed, it has effected 28 miles up 1 in 100. This, therefore, fits it for some parts of the island, especially the northern, where a common railroad would be scarcely practicable, not less than the means of working it by water instead of steam, and thus obtaining from the boundless power which is now wasted in most of our valleys that enlarged intercourse, which will open a way for wider and more important applications of it. But its most distinctive character is the absence of danger: its velocity is under the most perfect control; no perilous element is near the passenger, and collision is impossible. Therefore, if experience confirm the result of this first trial, the week of our meeting will form a conspicuous epoch in one of the most remarkable chapters of the history of the human race; and as they who have brought it up to this point of success are Irishmen, as it promises to benefit Ireland more especially, and in particular this very city, he trusted that this notice would be received with indulgence.

The third relates to the improvement of the reflecting telescope, by which his countrymen, and above all the President of the Association, have in the last few years been so honourably distinguished. From the interest excited by the commencement of a discussion in Section A, which was interrupted by the officers being obliged to attend a committee, he thought a brief notice might not be unwelcome here. The eye fails to perceive distant objects for two reasons,—their apparent minuteness, and their faintness. Both these are obviated by the telescope: its object glass or mirror forms a highly illuminated picture, as in the camera obscura; and this can be magnified by the eye-piece in proportion to its brightness, a proportion depending on that which the objective part bears to the pupil of the eye. Therefore, with instruments equally perfect in execution, the power depends on the diameter, and all improvements ultimately relate to that. Now, in the refracting telescope, when the objective part is of glass, we very soon reach a limit, from the impossibility of obtaining this substance in large masses sufficiently perfect for optical purposes. There is not in existence an object glass of 16 inches aperture, nor he believed four of 12; and their cost might be estimated, from the fact, that a disc of unwrought flint glass was now offered for sale, 8 inches diameter and 1 thick, at the price of eighty guineas. We are therefore obliged beyond these limits to avail ourselves of the principle of reflection; but here also we meet with difficulties that seem scarcely surmountable. The material of specula is easily procured, but it is perhaps the most untractable with which a workman ever meddles: harder than steel, but so brittle that a slight blow will shiver a large block of it to fragments, a slight trituration grind it to dust; it can scarcely be shaped by the common processes of the founder, and a very small warmth incautiously applied will split a large mirror. And the delicacy of the figure, necessary for perfect action, is scarcely to be conceived; quantities of space, which would elude all other measurement, are in this way made evident, so that the precision of the operation must be almost infinite. The form resulting from the common method of grinding and polishing these specula is that of a sphere, which, though easily attained, is useless, because its edge has a shorter focus than its centre; the curvature must, therefore, decrease in receding from the latter, so as to concentrate all in one point. Between this figure, called the parabolic, and the spherical, there are many intermediate, and all imperfect; but the extreme difference is so slight, even in Lord Rosse's gigantic telescope of six feet aperture, that if the two surfaces touched at their vertex, the distance at the edge, would not exceed $\frac{1}{70000}$ of an inch, a space which few can measure, and none without the microscope. Up to the size of six, or perhaps nine inches diameter, these difficulties are overcome by skilful workmen; but very few have ventured beyond the latter limit, and still fewer succeeded, so that in that field Lord Rosse stands alone. Even Sir William Herschel himself is no exception; his twenty-feet telescopes, of 18 inches aperture, being comparatively diminutive; and the forty-feet, of 4 feet aperture, however honourable to the astronomer and the king who constructed it, must be regarded as a failure. That so high a problem should have been mastered by one of Dr. Robinson's countrymen,—by one whose attainments are an honour to his high rank, an example to his equals,—an instance of the perfect compatibility of the highest intellectual pursuits with the most perfect discharge of the duties of domestic and social life,—gave him a pleasure which he could not conceal, and which he would express more strongly

Digitized by Google

were its object absent. The improvements made by Lord Rosse might be described as four, including a multitude of minor points, of which it might be said that none were the result of accident; they flowed from a series of experimental inductions, perfect in their kind, but which time would not permit him to detail. The first was in casting the specula. From what he said before of their material, it would be easily conceived, that without especial precautions it would infallibly crack in cooling. Of the three attempts by Sir W. Herschel to cast the four-feet speculum, two failed, though it was far below the true standard of four chemical equivalents of copper to one of tin. Others who have operated on *it* have not been more fortunate; it either cracks in the mould, or has a dull and porous surface, which makes it useless. Lord Rosse forms that surface of the mould which gives the reflecting face, of iron hoops, packed on edge, and turned to the spheric figure of the speculum—so close that they retain the liquid metal, so porous that the air which it entangles can escape. It chills and solidifies at once a small depth of the face; the sides of the mould, which are of sand, cool it more slowly, and the ultimate and dangerous contraction acts only on the back, which is cast open. The arrangement seems excessively simple, but *it never fails*. Of course, the speculum, which is tough at a high temperature, is transferred before it becomes brittle to an annealing furnace, and gradually cooled. The second change is in the position of the speculum: all other opticians, as far as Dr. Robinson knew, had it above the polisher. By reversing it, Lord Rosse gained many important advantages: he could examine its figure as the polishing proceeded, without removing it to the telescope—no trifling job, when it is near a ton weight: by placing it in a cistern of water kept at the mean temperature, he made the process free from the uncertainty caused by the friction, heating, and softening the pitch of the polisher; and by supporting the speculum on the identical levers which were to bear it, when acting in the telescope, he avoided all change of figure. Were a mirror accurately figured with its face downward, the mere act of reversing will unquestionably injure its performance, for it bends by its own weight. The slightest local pressure will turn a well-defined star into a blot or a comet; and this absolute identity of support in the two cases is of essential necessity, though never before thought of. The third is the machine which gives the movements requisite to obtain the parabolic figure. It is a remarkable fact, and an evidence of the correctness of the result, that Dr. Green, a native of this city, should have been led by his experiments to the same combinations: they consist, according to Lord Rosse, of, 1st, a stroke which carries the polisher ⅓ of the diameter of the mirror; 2nd, a transverse stroke 21 times slower and 0.28 of the same diameter; 3rd, a rotation of the speculum, performed in the time of 37 of the first strokes; and 4th, a rotation of the polisher in the same direction, about 16 times slower; and if these proportions be observed, the machine will do the rest; it scarcely requires to be watched, and if it be only arrested when the polish covers the surface, it is found that whether that be six inches diameter, or three feet, the figure is true. But as the curvature of the surface is not uniform, the shape of the polisher must change while it is produced. This instrument is made of cast iron covered with pitch, and coated with peroxide of iron. The change can only occur by the lateral spreading of the pitch, and to allow of this it had been usual to cut in it grooves regulated by the experience of the optician, and renewed as they fill up. Instead of this arbitrary plan, Lord Rosse has grooved the polisher itself, so as to break it into insulated and definite portions, and thus he reduces every part of the operation to precise conditions. Dr. Robinson apologized for such an imperfect sketch of these inventions, but he regretted still more that he could not venture to detain his hearers by telling them of the wonders which they had unfolded, and of the three-feet telescope actually employed at Parsonstown, the most powerful that has yet been pointed to the sky—of the light which it has already thrown on some of the most mysterious objects in the heavens. Never, wherever directed, had he looked into it without seeing its field crowded with stars; those wonderful clusters when a whole universe is condensed into a speck, become in truth a "heaven of heavens"; and the dim and problematic nebulæ break up into stars, and show indented and irregular outlines which even the Herschels, with their till now unmatched instruments, had failed to perceive. The moon must be seen with this telescope to conceive its power; the spectacle could not be described; but he hoped that some of the great geologists before whom he spoke would avail themselves of the opportunity of studying in our satellite some of the works of that mighty agent whose workings in our own planet have been less powerfully manifested, and marked by other influences. The counsel might seem strange to some; but it would cease to surprise when he told them that with this telescope a building the size of the one in which they were assembled would under favourable circumstances be easily visible on the lunar surface. He had hoped to be able to announce to them still more remarkable results from the six-feet telescope, but unfortunately it is not yet completed; that pleasure he trusted was reserved for him at York; and he must conclude with a grateful acknowledgment of the attention with which they had listened to so long and tedious an address. One thing only he would add: the effects of the British Association are not confined to the British Islands or to the mere collection of scientific facts; it occasionally exercises a moral influence still more important. One of such results has been the establishment of an Italian Association, an event which must be hailed with joy by all who have visited that delightful country. In reading an invitation which he had received to join the meeting of this year he was struck by the term employed to express it, "Adunanza"; the word implies from its etymology "a making one," and how precious is the lesson which it reads us. In these annual assemblings, we may or may not add much to the domain of Intellect; we may deceive ourselves in supposing that we carry away ourselves an increased excitement to the pursuit of knowledge, or that we have given to others an encouragement or motive to increased exertion; but this cannot be denied, that they make us know and love each other,—that they cherish and develope the noblest portion of our nature.

Report on the Mollusca and Radiata of the Ægean Sea, and on their Distribution, considered with reference to Geology. By Edward Forbes, Prof. Bot. King's Col. London.

This Report, which was drawn up at the request of the British Association, is the result of eighteen months' research in the Ægean Sea, and on the coasts of Asia Minor, during the greater part of which time daily observations were made, and numerous explorations of the sea-bottom conducted by means of the dredge in all depths of water between the surface and 230 fathoms. During the progress of the inquiry, the author was attached, as naturalist, to H.M. surveying vessel *Beacon*, and received every possible assistance from Captain Graves and his officers, without whose active co-operation the results could not have been obtained. The objects of the inquiry were, firstly, to collect and define the several species of Mollusca and Radiata inhabiting the Eastern Mediterranean; secondly, to ascertain the conditions under which those animals live, and the manner in which they are associated together; thirdly, to ascertain whether species known only as fossil exist in a living state in depths and localities hitherto unexplored; and to compare species and the associations of species now living in that sea, with the fossil species found in the neighbouring tertiary strata.

The first part of the Report is devoted to an enumeration of the species, with an account of the range of each in depth, and the ground on which it lives. The marine animals of the Ægean, although they were the subjects of the studies of Aristotle, had been but little studied in modern times until the coming of the French expedition to the Morea, to which a staff of naturalists was attached. The number of species recorded by the French has been greatly increased by Prof. E. Forbes, that of fishes being doubled, more than 150 species of mollusca being added, and numerous radiata, articulata, and amorphozoa recorded, of which classes there was no previous account. Of the animals which especially form the subject of this Report, nearly 700 species were observed, of which catalogues have been prepared, with tables showing their distribution. The second part of the Report treats of the causes which regulate the distribution of the mollusca and radiata in the Ægean, and of the several regions of depth presented by that sea. Eight distinct regions, each presenting its peculiar association of species, were defined between 0 and 230 fathoms. The most superficial of these, although the least extensive, having a depth of only 2 fathoms, is most prolific in animal and vegetable life, and most various in mineral character. The second region ranges from 2 to 10 fathoms, the third from 10 to 20, the fourth from 20 to 35, the fifth from 35 to 55, the sixth from 55 to 75, the seventh from 75 to 105. The eighth exceeds in extent all the others combined, ranging from 105 to the lowest depth explored, and presenting a uniform mineral character throughout, and a very peculiar Fauna. Certain species were found to range through several of these zones, and two through all. It was found to be a law—that the extent of the range of a species in depth is correspondent with the extent of its geographical distribution. On the other hand, species having a very limited range in depth were found to be either peculiar Mediterranean forms, or such as are extremely rare in the Ægean, but abundant in more northern seas. The testacea of the Ægean are for the most part dwarfs, as compared with their analogues in the Ocean, and the number of medusæ and zoophytes are comparatively small. Below the fourth region in depth the number of animals diminishes as we descend, until, in the lowest part of the eighth region the number of testacea was found to be only 8, indicating a zero in the distribution of animal life at probably about 300 fathoms. In the upper regions the more southern forms prevailed, whilst those of the lower zones presented a northern character, indicating a probable law—that in the distribution of marine animals, regions of depth are equivalent to parallels of latitude. The colours of testacea were found to become more varied and vivid in proportion to their proximity to the surface. The representation and replacement of specific forms by similar but not identical species, has been long recognized in time and in geographic space. During the course of these researches, a corresponding succession and replacement of forms by similar forms was discovered in depth. Each species attains a maximum in developement of individuals, and gradually diminishes in numbers as we descend; but before its disappearance in many genera, a representative species commences, attaining a maximum after the disappearance of its predecessor, and then, in like manner, diminishing to a minimum and disappearing. Genera are, in like manner, represented and replaced by corresponding genera. This is true equally with vegetables as with animals. Green fuci were found as deep as 55 fathoms, and millepora extends its range to 105 fathoms. The third division of the Report is devoted to the geological bearings of the author's Ægean researches. A few testacea, hitherto known only as fossil, were found by him living in the Eastern Mediterranean. They were all tertiary forms, and were either species of which but few examples have been found fossil, though abundant in a living state, or such as are abundant fossil, while but a few stray specimens were taken alive. In the former case the mollusc is in its maximum now, in the latter it is dwindling to its minimum, and will probably soon become extinct. The definition of the regions, and the determination of the associations of species, afford a means by which to determine the depth at which a stratum containing organic remains had been formed; and the data embodied in the Report tend to show that inductions from organic remains as to climate are fallacious in geology, unless the element of depth be taken into consideration. By this latter test, the bay of Santorin, now more than 200 fathoms deep, was shown to have had a depth of only between 20 and 35 fathoms previous to the uprising of the island of Neokaimeni in 1707. This was ascertained by an examination of the animals imbedded in the sea-bottom upheaved during the eruption.

Among the geological phenomena now in progress in the Ægean, the following are remarkable and important. The filling of the 8th region in depth by the white sediment which forms its sea-bottom, will produce above 700 feet of cretaceous strata, uniform in mineral character and organic contents; whilst, as the zero of animal life is but little below that region, and the Ægean is probably in a great part of its ex-

Digitized by Google

tent more than a thousand fathoms deep, we may have thousands of feet of strata having a uniform mineral character, and without a trace of animal existence. Any oscillations of level, however slight, would produce alternations of strata containing distinct groups of organic beings, with others void of such; and partial alternations of marine and fresh-water beds would be formed, a phenomenon now in progress on the coasts of Asia Minor. All this would occur without convulsions or violent catastrophes of any kind. Changes of level, however slight, might cause the extinction of whole genera of animals and plants, of which only such as had hard parts would be preserved. Were the present sea-bottom of the Ægean to be upheaved, whole classes of animals would disappear, and leave not a trace behind to assure the future geologist of their having existed.

ST. PAUL'S.

WINDSOR'S architectural cynosure, St. George's Chapel—for the Castle is a piece of proud masonry, not architecture—after having undergone extensive repairs, has just been re-opened, to the public who pray and the public who pay, on the same narrow plan of accommodation to both as before. Visitors however, we hear, will shortly be granted gratuitous ingress twice per week, Tuesdays and Fridays; the sooner the better—

Bestowing soon
Doubles a boon!

Correspondents meantime are loud in their written outcries against the extortionate demands of show-money made by St. George's Chapel-guardians, whom we must believe sprung from the blood of the old dragon, such a fierce claw do they lay upon every visitor, so fiery and foul a breath do they discharge unless he throws them a sop that would appease Cerberus. Among the complainants, one, we observe, quotes as a rebuke to all rapacious vergers, beadles, sextons, and similar functionaries, the entrance-fee accepted at St. Paul's—twopence. Alas! our diocesan door-keepers cannot accept the compliment with the same right they may the half-groat: it grieves us to dispel this beautiful illusion about sympathetic loftiness of character between our Basilica and its show-men, but truth must be declared—the charge for seeing St. Paul's is *four shillings and four-pence* a head, precisely. Whatever simple ruralists imagine, the gryphons here have claws, and as wide a grasp and as deep a gorge as their brethren beyond the lamps. No! that sublime cupola is not a dove-house, where immaculate creatures perch tier over tier, and pick up the crumbs which passengers drop them; its veritable pigeons are the plucked. A self-denying ordinance among our basilical ciceroni forsooth! Why they never pretended to the twopenny liberality of character awarded them—never made any regulation having in view a monkish vow of poverty, except perhaps one against it. They are orthodox folk, who love full-sized loaves and fishes like their betters, and would accept but two groats less than a crown, current coin of the realm, from St. Paul himself, if he came by chance to visit his own temple. True, for the copper perquisite above mentioned, sight-seers can obtain a complete survey of the floor, and get a nebulous notion of the roof (when there happens to be sunlight at noon in London); moreover, certain marble unseemlinesses, called statues, resembling men whom Gorgon had frightened into stone, are viewable for the same sum; but to see St. Paul's, as a person is said to see St. George's Chapel, would cost what we have stated—about one day's wages of a verger, or respectable cathedral-servant, thus saved to the sacred coffers. We give the authorized tariff of expenses, lest their enormous sum-total, still more than our tropes, might make a reader think we were romancing:—

To view the Monuments and Body of the Church	0*s.* 2*d.*
To the Whispering Gallery and the two outside Galleries	0 6
To the Ball	1 6
To the Library, Great Bell, Geometrical Staircase, and Model Room	1 0
Clock	0 2
Crypt or Vaults	1 0
	4 4

If "Peter's pence" be no longer levied upon our countrymen, here are Paul's pence instead, or rather Paul's shillings. Well might a grave humourist look round as he disburses his last fee, and ejaculate—"Truly an imposing interior!" This tariff, it is manifest, has been arranged with a shrewdness that would not discredit Madame Tussaud, nor any other adroit manager of an exhibition, the entire spectacle being distributed into parts, none of which affords the visitor too much amusement for his money, whilst each decoys him onward from the previous sight to fresh wonders and expenditure. Is there no want of 'Rebecca' in our sacrosanct basilica, where all these toll-gates are set up within the circuit of half a mile? Yet we have left another—a kind of multiple turnpike—unmentioned; and shall give its details, whose ingenious combination even Welsh landlords themselves will acknowledge artistic. Separate charges being affixed to the separate departments, a pilgrim would imagine he might visit any single one among them at his pleasure, but he may find himself perchance, on trial, the victim of his credulous nature, thus: Suppose he has little enthusiasm about "Whispering Galleries," and much about fine architecture, nevertheless he cannot behold Sir Christopher Wren's masterpiece—the *Protestant* plan of St. Paul's—except by a visit (or at least, fee) to both the said whispering place and the model room. If an architectural student or amateur would examine that plan well, and therefore often, he must pay each time—entrance fee 2*d.*, galleries 6*d.*, model room 1*s.*—altogether 1*s.* 8*d.*! This is the case also if his object be the geometric staircase, library, or belfry alone, he must run a similar gauntlet of toll-collectors, each coming down upon him heavier than the last. Yes, what a huge head and shoulders the metropolitan basilica exhibits over all the other churches and chapels of the diocese, in moral as well as physical elevation! What patterns of disinterestedness are its showmen! How they devote their lives for the public advantage—and four-and-four pence per visitor! This is their *oligon-te, philon-te*, the modicum with which, like hard-working heroes of yore, they are content. Self-sacrificers? oh, ay,—"pelicans in their piety"! Then, as each sight finishes, how civil, how sedulous, to inform the visitor—"But two-pence more, and you see the wonderful Clock, sir."—"You are now half way to the Ball, sir; another eighteen-pence takes you up, weighs 5,600 pounds, holds 12 persons, "Arrow-on-the-Ill" visible from it just now, sir; only eighteen-pence additional." He that after these illustrations can believe St. Paul's a tabernacle of whitehanded human cherubim, guarding the sacred treasures, could swallow a camel; he whom the tariff itself does not convince of the reverse, must have a pericranium like the cupola—all wood and lead and emptiness—except its bones. Were indeed Westminster Abbey, which is seeable throughout for sixpence, quoted as a model, perhaps that might possess some claims. But at St. Paul's, Mammon has a statue no less than Howard the philanthropist, and receives worship as fervent there as at Change Alley: reader, if thou seekest his shrine—*Circumspice!* Yet wherefore should we fall foul of the poor mercenaries, or (it may be) the self-formed gang who practise this polite "stop and deliver" system under permission? And even were they responsible, could we hope to make any impression on such pachydermatous animals? It is those who farm the indoor church-tax to these people at a rack-rent, or hire them at no wages as church-servitors, whom we should hold accountable; those who ordain the *ukase* which establishes the exorbitant rates, not those menial officers who enforce it. Having consulted an old London Guide-book (1819) we discover that the charges then averaged two-pence, and made up altogether but 3*s.* 6*d.*, crypt money exclusive; then, likewise, no multiple turnpikes were demanded, but each object could be seen separate, after paying the general admission two-pence. Such has been the progress in liberal spirit accomplished by our civic Dean and Chapter in the fourth of a century! All are, to be sure, impeccable private characters, the very best men alive; no tombstone is large enough (not *Long Meg* itself!) to contain the list of their perfections when deceased; they divide all the cardinal virtues among them, share and share alike, and each leaves at his death his share of them to his successor; but their incorporated merits, by some odd effect of condensement, refute the well-known axiom, and render the whole much less than its parts. Sarcasm aside, what can excuse the tariff above-mentioned? why this imposition of taxes upon self-instruction, these obstacles thrown in the way of popular self-amelioration through the means of self-amusement?

FOREIGN CORRESPONDENCE.

A By-way on the Rhine.

THE last ten years and the Zoll-verein have done much for the Rhine-land: the prying English, too, have helped a little by their money and their curiosity—too much, many will say, to leave room for a single additional written line on ground so beaten. Yet, since I have been a sojourner in the district, I seem to have found matter for a note or two, worth circulation perhaps, as *addenda* and *corrigenda* to certain guide-books in good esteem. After Murray's Handbook (which, by its universal acceptance, bids fair to characterize the Englishman as universally as the beefsteak, or the ejaculation so eloquently descanted upon by *Figaro*), Mrs. Trollope's 'Belgium and Western Germany,' professedly a guide-book, seems sufficiently quoted and consulted by our autumn tourists. Here it lies beside me: an amusing specimen of foreign typography, mutely protesting in favour of copyright, since, even remembering the Italian of the authoress in her recently published Tour, I cannot conceive that blunders and omissions so numerous as fill the Brussels edition originate from her pen. MM. Hauman & Co. then—not the lady—have given the church of St. Jacques, in Liege, to St. Paul; they have omitted all that the English connoisseur *must* have said *apropos* of St. Bavon's church, Ghent, touching the inimitable Van Eyck's picture of the 'Adoration of the spotless Lamb.' But their *lacunæ* in reprinting the pages devoted to the Rhine valley are yet more daring and wholesale. I must mention one or two specially.

At Godesberg—to go no further—much is overlooked. The English, by the way, have got the habit of too generally passing by this station; and the "beautiful sight," or Bellevue, so glowingly commemorated by the genial authoress of 'Widow Barnaby,' is now—more's the pity—as deserted a hotel as a sulky misanthrope would choose to hide in. Yet the views are charming, and the excursions thence endless. One cut out by the Brussels pirates from Mrs. Trollope's *vade mecum*, and very slightingly treated by Murray, will show the pilgrim,—be he of the most easily-fatigued or fastidious order,—as fair a scene as exists. This is the four miles' walk to the ruin of the monastery at Heisterbach. Crossing the Rhine at Nieder-Dollendorf, a rough but practicable carriage track, or better still, a charming wood-walk, brings the traveller into a secluded valley at the foot of the Petrusberg, the steepest of the seven mountains. Here, among swelling corn-fields, warmly sheltered by hills swathed in wood, the holy house had been built by the best judges of comfort and the picturesque—the monks. The gateway remains complete, with the *Wappen* (escutcheon) above the arch, and a gigantic saint in his niche on either side, shaded by two chestnut trees, against the foliage of one of which leans a tall cross. Within this gateway, an avenue bordered with plum and walnut trees, now breaking down beneath their fruitage, opens out into a little meadow. On the left is the ruin—a very small fragment of the choir of the church, peculiar enough in its architecture, and sufficiently singular in the forms of its decay, to stand very high among ruins. The arches are of that Oriental or Moresco form, of which few examples are to be found so far north. A row of pillars, supporting the vault, reminded me of details from the Alhambra, made familiar by drawings. What is left, moreover, is still sharp, fresh, and intact; for it is not Time that has all but obliterated this splendid fabric, but War. Behind the church is the little grave-yard, thickly set with sunken crucifixes, and mossy grey head-stones, whose legend none can read. A more ambitious tomb or two (one a new family mausoleum,) stand about among the rich trees and flowering shrubs which fringe the meadow. A fairer scene for a summer evening's musings, is not to be found. Within the precincts, the grange has been converted into a humble house of resort, where those desiring to see the sun rise from the Oëlberg (the highest of the Siebengebirge), may sleep.

Digitized by Google

A stone's throw out of the road from Godesberg to the Ahr valley stands another relic, of which Murray makes no mention, nor, indeed, any other guide-book I have seen,—the great old house of Gudenau, (so spelt by the guide, and possibly, therefore, a Rhenish version of the name). This may be because sight-seers care little for empty rooms, and long passages, and winding staircases,—nay, even for a moat, an oriel, a drawbridge, and turrets *à discrétion*, unless there be besides pictures, or architecture, or a legend, or a prospect. Yet surely, in a strange land, the very arrangement of chambers and their decoration is a glossary upon modes of domestic life differing from our own; while the difficulty of tracing the history of so large a pile is not unwelcome, as giving Fancy scope. At all events, the place, as we came upon it, (not knowing precisely what our ramble was to end in,) was striking enough to repay six miles of gradual ascent among fruit orchards, and meadows, and woods, and *dorfs*, on a day so drizzly as to make any walk rated as a wonder even for English extravagance. The afternoon was closing in, and the wind whistling through the dripping branches of a tall fir avenue, as we entered the first court-yard, under a gateway flanked by two of those dropsical-looking bell-towers, the form of which is as German as the *tourelle* is French. A shrill-voiced, bright-eyed, nimble forester's wife, staring at such foul-weather pleasure-hunters, came out, and too soon handed us over to a far less pleasant *cicerone*—a tailor, who, pipe in mouth, went here and there, now exhibiting a weed-grown terrace flanked with two statues of *rococo* sculpture,—now perilling us, on a rotten drawbridge, over a dank and wide moat,—now marshalling us from chamber of dais to ball-room, for on one floor the chalk marks were freshly visible,—with a phlegmatic and ignorant stolidity thoroughly vexatious. Whose were the arms on the grand escutcheon over the entrance to the second court—what the name of the family that had sold the estate to a Jew, who had sold it to some one else,—what date some curious old arras bore—by whom had been set up a dry fountain of grotto-work in a sort of inner parterre—how many years had elapsed since service had been said and sung in a small dusty chapel—he could not tell. But the castle, though wretchedly dilapidated in parts, and in parts tastelessly modernized, was worth the trouble and the bad weather, as a specimen of a great German house, with its accommodations for sluttish plenty and comfortless magnificence. There were turret rooms, which even sunshine would have made charming,—dark staircases, leading down Heaven knows whither,—suite upon suite of parlours and chambers, sufficient to accommodate a moderately sized fraternity or sisterhood. Above all, the spectacle of so large a building in a corner so out-of-the world, and among roads so bad, even now, suggested the idea that few coaches or chariots had ever entered there, and took us, therefore, back to the palmy days of pillions, palfreys, and long family processions, such as Wouvermanns painted, and a Spindler or a Schopenhauer would have described *con amore*. I will not say that Gudenau is worth leaving the steamer to see, but a sojourner at Godesberg should not overlook it. So much for a couple of sights off the Rhine, which, perhaps, you will have no objection to commend to all whom they may concern. I could mention a dozen more, in proof of the assertion with which I started, that the land is still not wholly exhausted.

OUR WEEKLY GOSSIP.

THE *Times* and the *Herald* have each had leading articles on the letter which we lately published (*ante*, p. 794), addressed by Sir Robert Peel to Mr. Eastlake, as Secretary to the Commission of the Fine Arts, on the possibility of devoting some portion of the New Houses of Parliament to public monuments, to be erected to the memory of men entitled to the gratitude of the country. Most persons, who have at all considered the subject, have long been of opinion that some public building should be appropriated or erected for this special purpose. The absurdity, to say nothing of still weightier objections, is glaring and offensive, of voting large sums of public money for the purpose of erecting monuments in Westminster Abbey and St. Paul's, where they can only be seen by favour and on payment, and from which the public *might be* excluded altogether; but we do not see how the case will be materially altered, if such monuments are to be erected in the New Houses of Parliament. It is a question whether the embellishments already decided on can be fully carried out without causing great delay in the opening of the building for public business. Further, it is very doubtful whether, when completed, the interior—that is, all the embellished parts of it—can be rendered accessible to the public generally, except at rare intervals and under stringent restrictions; more especially as the corridors, though sufficient for their acknowledged purpose, will be much too narrow for public galleries, liable to be crowded with spectators. Other objections present themselves, but enough has been said to arouse attention to the subject.

The National Gallery has again closed its doors for the six weeks annual vacation, and we regret again to be obliged to protest against this very inconvenient arrangement. We have reason to think, that the subject has been brought to the notice of Sir Robert Peel, one of the trustees of the gallery, and that some hopes were held out that the inconvenience would be remedied. This is just the period of the year when certain classes, the London shopkeeper especially, have most leisure to visit the gallery, and it is both absurd and contrary to the practice of all government offices wholly to close the gallery in order to give the officers a vacation. By engaging an extra attendant, it would be quite easy to arrange that one officer should take his holidays at a time, instead of all taking them at once.

A correspondent, who believes that we take an interest in the public enjoyment of parks and pleasure grounds, writes with regret, to beg us to notice that the public are now wholly excluded from Oatlands Park, through which they have enjoyed right of way almost from time immemorial, and to warn those who take "days' excursions out of London" into the neighbourhood of Walton and Weybridge, of the fact. He says that the exclusion must be some act of petty tyranny, probably without the sanction of Mr. Ball Hughes, or sanctioned under some misrepresentation, because the house is at present without any occupant, (Lord Francis Egerton having removed to Cobham,) and is only inhabited by some half-dozen of the Duke of Sutherland's laundresses.

The bishops of Belgium have issued a manifesto against the swarm of books of bad moral tendency daily reprinted (chiefly from the French) by the Belgian press. The extraordinary cheapness of these works has given them a wide circulation, and the evil seems to be rapidly spreading. The bishops also call upon the clergy of the country to form libraries, for free circulation among the people. One library, which has been already formed, by donations exclusively, in Brussels, for this purpose, is said to have lent during the past year upwards of 30,000 volumes.

The sculptor Schwanthaler is now occupied on two statues, of the size of life, of Huss and Ziska. They are to be cast in bronze, and deposited in a Bohemian Walhalla, which is to contain statues of famous Bohemians, and is being formed by a private gentleman at Lobich near Prague.

The publishing world in Germany seems almost as dull as our own. Among the few novelties which are announced are a Universal History from the conjoint pens of the well known historian Schlosser and Dr. Kriegk, a writer of some repute in Frankfort.—Jügel, the chief Frankfort bookseller, is publishing a work entitled the Rhine Album, to contain seventy steel engravings of the chief points of interest on the river. A new poet, Geibel, is also causing some sensation. He is strongly opposed to the rationalist poets, and also to the so-called poets of liberty, as Herwegh. His poems are written in easy verse, and are at times very brilliant. *Au reste*, with the exception of the manifold rationalistic writings with which the German press is teeming, there seems nothing stirring. We may, however, mention as an indication of a growing spirit of intolerance, of which the continental papers have recently furnished several instances, a piece of petty tyranny which has made some noise in Frankfort. It seems that a society of vocalists in that city, called the "Liederkranz," engaged in getting up a memorial to Mozart, and giving frequent concerts for that purpose, has refused admission as a member to a Jew, on the ground of his religious belief. This act of intolerance has driven Speyer, a well known composer, and president of the "Liederkranz," out of the society, and has induced several influential Jews to withdraw their subscriptions to the Mozart Memorial. We need not say that acts like these can further the interests neither of religion nor science, and least of all should have proceeded from musicians, who are indebted for some of the most beautiful compositions in their art to Jewish writers.

The results of the last journey made by the celebrated archæologist, Karl Ottfried Müller, are in the course of publication at Frankfort-on-the-Maine. The first Part, which is already published, contains 'The Antiquarian Collections of Athens'; the second will comprise in it the architecture and sculpture of that city; and the third will contain an account of the author's travels in the Morea and Rumelia.—Moritz Retzsch has just issued another series of illustrations, having for their subject 'The Merry Wives of Windsor.' They are, however, inferior to his former works. The Falstaff is a mistake from beginning to end, being rather the hopeless sot than the witty profligate. There are many graceful figures, especially in the scene with Herne the hunter, but we have seen them all before in Mr. Retzsch's previous Outlines.

DIORAMA, REGENT'S PARK.

NOW OPEN, with a NEW EXHIBITION, representing the CATHEDRAL of NOTRE DAME at Paris, with effects of Sunset and Moonlight, painted by M. REMOUX, and the BASILICA of ST. PAUL, near Rome, before and after its destruction by Fire, painted by M. BOUTON. Open from Ten till Five.—N.B. A GRAND MACHINE ORGAN has been constructed expressly for this Exhibition, by Messrs. Gray and Davison, of the New-road, and will perform the Gloria, from Haydn's Service, No. 1, during the midnight effect of the Cathedral of Notre Dame.

RE-OPEN TO THE PUBLIC.

ROYAL POLYTECHNIC INSTITUTION.—FIRST PUBLIC EXHIBITION of Two important Discoveries in Science, viz.—ARMSTRONG'S HYDRO-ELECTRIC MACHINE, which will be exhibited Daily at Three o'Clock, and at Eight in the Evenings; and LONGBOTTOM'S OPAQUE MICROSCOPE, showing Objects in NATURAL HISTORY in all their varied Colours. LECTURES Daily on CHEMISTRY and NATURAL PHILOSOPHY by Dr. Ryan and Prof. Bachoffner. The arrangement of the OPTICAL DEPARTMENT is under the management of Mr. Goddard. DISSOLVING VIEWS and COSMORAMIC PICTURES, MODELS of all kinds of MACHINERY in MOTION, DIVER and DIVING BELL, &c. Conductor of the Band, T. Wallis, Mus. Doc. Open Mornings and Evenings, except Saturday Evenings. Admission 1s.—Schools Half-price.

SCIENTIFIC AND LITERARY

BOTANICAL SOCIETY.—*June.*—J. Reynolds, Esq., Treasurer, in the chair. Mrs. M. Stovin presented specimens of *Anemone ranunculoides*, found *wild* in a wood near Worksop. The conclusion of a paper 'On the Groups into which the British Fruticose Rubi are divisible,' by Mr. E. Lees, was read. It was there stated that the barren stem offers the best, if not the only plan, of discrimination in subdividing Rubi into groups, especially if the erect or arched mode of growth, and continuance of vitality, be also taken into consideration. And in this view the differences resolve themselves almost entirely into the perfect smoothness, the glaucosity, or greater or less degree of hairiness, and the glandulosity of the barren stems. Commencing then with *R. cæsius*, and ending with *R. idæus*, it will appear that seven groups are easily separable from each other, passing from one into the other in a very natural manner. These, at all events, may be considered the smallest number of species into which our Rubi can be classed without confounding really different things. 1. *Cæsii.*—Having the barren stem round, bloomy, covered with unequal prickles, trailing, rooting. *R. cæsius* and its various derivatives. 2. *Glandulosæ.*—Barren stem angular, hairy and prickly, setose, very glandular, arched or trailing, rooting. *R. radula* of Weihe and Nees, Kœhleri, fusco ater, &c. 3. *Villicaulæ.*—Barren stem angular, very hairy, but without glands, prickly, arched, or decumbent, rooting. *R. villicaulis* W. and N., *R. leucostachys*, Smith, &c. 4. *Fruticosi.*—Barren stem angular, glaucous, prickly, arching, rooting. *R. fruticosus* and *discolor*. 5. *Nitidi.*—Barren stem angular, almost smooth, with a few prickles, rooting rarely. *R. affinis, nitidus, rhamnifolius, &c.* 6. *Suberecti.*—Barren stem angular, very smooth, nearly erect, not rooting. *R. suberectus*, Anderson and Smith, *R. plicatus*, W. and N., and *R. fissus*, Lindley. 7. *Idæi.*—Barren stem round, wdony, covered with innumerable small dilated prickles, erect. *R. idæus* and varieties. The paper was accompanied by numerous specimens, which are deposited in the Society's Herbarium.

July.—J. E. Gray, Esq., President, in the chair.

Digitized by Google

'Observations on Dicranum Dillenii,' by Dr. Thomas Taylor, were read.

August.—J. E. Gray, Esq., President, in the chair. The following papers were read:—'Notice of a variety of *Rosa sarmentacea*, (Wood's) found by Mr. Clarke, near Bridgewater,' by Mr. E. Lees. 'Notice of the Mosses found in the neighbourhood of Bristol,' by Mr. G. H. K. Thwaites. The author enumerated 133 species as indigenous to this locality, some of which were new to the British Flora. The President drew attention to an abnormal form of *Ophrys apifera*, which had been sent to him by a lady from Dorking. The two lower flowers of the spike had two distinct united columns, the upper normal one being rather the longest and over-lapping the other. The upper flowers had three columns united into a single triangular mass; the upper petals of each of the flowers were rather reduced; the lips of the two lower flowers were small, and retained in part the usual character of the flower, but the lip of the top flower was lilac, and exactly resembled the sepals in form and colour. The three sepals of the middle flower were united together nearly to the tip, as was the case with two of the sepals of the terminal flower. The ovaries of all the flowers were of the normal structure. The President stated that the Rev. G. E. Smith had figured an Ophrys with a similar triple column, but his specimen was quite destitute of any lip, and he observed that it might be worth while to examine if this excess of developement of the column was always coexistent with the reduced developement of the lip. He moreover stated that this structure was quite distinct from the monstrosity of this plant described by Mr. His, where each of the three petals was transformed into polliniferous columns.

Horticultural Society.—*Aug.* 15.—R. H. Solly, Esq., in the chair. Sir H. Willoughby, Bart., the Hon. G. F. Hamilton, Gen. Caulfield, Jas. Ackers, Esq., M.P., John Broadhurst, Esq., P. Rolt, Esq., and R. J. T. Tompson, Esq., were elected Fellows. It was announced that the seeds lately brought over by Mr. Hartweg might be obtained by Fellows. Mr. Standish, of Bagshot, exhibited four seedling fuchsias, which he stated to have been obtained in the following manner: Having raised in 1842, from *F. formosa elegans*, fertilized with the pollen of *F. corymbiflora*, some pretty seedlings, these again seeded freely without assistance, and gave rise to the present plants, which showed that this tribe, instead of degenerating like calceolarias, and many florists' flowers, if not crossed, improved considerably. Col. Sowerby sent half-a-dozen very fine peaches, from standard trees, growing in the centre of a house upon the rafters of which Vines are trained; one of the specimens had been produced upon the end of a shoot devoid of a terminal bud: a Banksian medal was awarded. H. Webb, Esq., sent a handsome collection of the dried Ferns of Madeira, beautifully prepared and arranged.

Sept. 5.—R. W. Barchard, Esq., in the chair. R. Osborne, Esq., and W. Ellis, Esq., were elected Fellows. The show of flowers and fruits was unusually good for the time of year; amongst the peaches exhibited were some well-swelled and beautifully-coloured Noblesse Peaches grown by Sir C. Sullivan, which, independent of their great beauty, were interesting from the circumstance of their having been produced by a tree sixteen years of age, which was removed two years ago from a south to a west aspect, and never produced previous to its removal such fine fruit as those exhibited. Mr. Frazer, the gardener, is of opinion that all peach-trees of any size are improved by being occasionally removed and properly transplanted. A certificate was awarded for the peaches.

Entomological Society.—*Aug.*—G. Newport, Esq., President, in the chair. Mr. W. W. Saunders exhibited a specimen of the Australian genus *Cilibe* taken alive in a garden near London; also some small Homopterous insects, which have proved very injurious in oak plantations throughout extensive districts in Scotland, by raising blisters upon the leaves; also specimens of *Phytomyza lateralis*, a small fly which had attacked the petals of the pansy by puncturing them and extracting the colouring matter with their haustellum. Mr. Marshall exhibited a remarkable variety of *Hipparchia Galathea*, of a white colour with all the ordinary markings obliterated. The following memoirs were read: 1. On the insects residing in dead bramble twigs, by Mr. F. Smith. 2. Description of a new species of *Ceria*, by Mr. Saunders. 3. On some new exotic species of beetles belonging to the family *Aphodiidæ*, by Mr. Westwood.

MISCELLANEA

Paris Academy of Sciences.—Sept. 13.—A work on digestion was received from M. Blondlot. The author has directed his attention principally to the gastric juice, which he regards as the principal agent in the functions of digestion. In order to obtain this juice in abundance, and in a pure state, M. Blondlot made an artificial opening into the stomach of a dog, which enabled him to extract the gastric juice, or alimentary substances, at various periods of digestion. In his work he announces that his experiments have been perfectly successful, and that he has a dog on which he made his first essay, two years ago, and which can supply him, he says, in the course of an hour or so, with more than three ounces of pure gastric juice.—A communication on the action of sea water on the material, for foundations, composed of lime and pouzzolane, a sort of Roman cement, and called *béton*, was made by M. Vicat. M. Vicat has ascertained that béton made with artificial pouzzolane undergoes in sea water an extraordinary change destructive to it as a cement; but that this is only the case on the coasts of the Mediterranean, and not those of the Ocean. The author, in his experiments to ascertain the cause of this fact, found that the waters of the Mediterranean contain 7.02 of sulphate of magnesia, whilst those in the Ocean (in the Channel) contain only 2.29. The quantity of hydrochlorate of magnesia is much smaller. M. Vicat points out various modes of varying the composition, according to the locality in which it is to be used.—M. Person sent a paper on the heat required for the generation of vapour in various fluids. He gives this table of the comparative point of ebullition:—Sulphuric acid, 10; ether (chlorhydric), 11; ether (sulphuric), 35.7; brome, 44?; spirit of wood, 66.5; alcohol, 78.8; water, 100; essence of turpentine, 156.8; iodine, 175?; sulphur, 316; mercury, 350.—A paper on the locomotion of man and animals was read by M. Maissiat.

Vocal Phenomenon.—The *Times* informs us that in a recent number of the *Zeitschrift* appears an account of an extraordinary vocal phenomenon. The new musical wonder is a boy, who has the power of emitting three vocal sounds at a time, and can therefore execute pieces in three parts. The fact is attested by two names of considerable weight, Kalliwoda and Mayer, from whom letters are published describing the exhibition, and warranting the genuineness of the prodigy. His voice, we are told, extends over two full octaves, from A flat below the line to A flat above, in the key of G; the lower notes being generally weak, those in the middle stronger, but of harsh quality, while the upper notes are soft, and flowing as those of a flageolet. When singing more than one part the lad is unable to pronounce any words, and can only sing songs of the utmost simplicity as regards the harmony.

St. Mary's Church, Reading.—During the course of last week three very ancient sedilia, of the Early English architecture, were discovered in ruins behind the wainscotting on the south side of the chancel, the fresco painting at the back of them and the encaustic tiles being still in excellent preservation.—*Globe.*

A New Pavement.—A newly invented wood pavement has been laid down opposite the residence of the mayor, in the Rue de l'Ecu. It is a combination of wood and asphalte, possessing seemingly the advantages of both, without the inconveniences of either, being impervious to water, free from danger to horses, and costing 25 per cent. less for carriage roads, and as much as 50 less for foot pavements. Should it answer, we hear it is talked of laying it down hence to Amiens, and running locomotive carriages upon it. It is the invention of Colonel Sir J. Lilly: the cost is said to be about 5*s.* a-yard.—*Boulogne Gazette.*

To Correspondents.—Adélé—J. W.—J. W. L.—G. B. W.—J. L.—received.

If G. H. will refer to the Index, he will find all the particulars he requires of the Antarctic expedition, including a letter from Sir John Franklin (No. 702), and one, with a general summary of results, from Capt. Ross himself (No. 726). Numberless notices have from time to time appeared in the *Athenæum*; and one letter from an officer in March last (*ante*, p. 213), contained an account of the collision to which he refers.

PAYNE'S POETRY FOR CHILDREN.
Just published, price 3*s.* bound in cloth, the 3rd edition (54th thousand), corrected and enlarged, of
SELECT POETRY for CHILDREN; with brief Explanatory Notes.
By JOSEPH PAYNE.
"A very nice little volume, containing a charming collection of poetry."—*Spectator.*
"A very pleasing and suitable selection."—*Westminster Review.*
London: Relfe & Fletcher, 17, Cornhill.

SIR WALTER SCOTT'S WORKS.
On Saturday, 30th September, will be ready, in continuation of, and uniform with, the Waverley Novels in 25 vols., and Life of Napoleon in 5 vols.
TALES OF A GRANDFATHER, Vol. I.
To be completed in 3 vols.
And on the same day,
WAVERLEY NOVELS, ABBOTSFORD EDITION, Part 38.
WAVERLEY NOVELS, PEOPLE'S EDITION, No. 92, and Part XXIII.
IVANHOE, People's Edition, complete, price 1*s.* 11*d.*
The following are also ready:
WAVERLEY NOVELS, ABBOTSFORD EDITION, Vol. III. cloth. gilt.
WAVERLEY NOVELS, ABBOTSFORD EDITION, ROB ROY and HEART OF MID-LOTHIAN, as separate Novels, cloth, gilt, forming Vol. III.
R. Cadell, Edinburgh; and Houlston & Stoneman, London.

SUMMERLY'S
HOME TREASURY
OF BOOKS, PICTURES, TOYS, &c.:
PURPOSED TO CULTIVATE THE AFFECTIONS, FANCY, IMAGINATION, AND TASTE OF CHILDREN.

BIBLE EVENTS, WITH 8 PICTURES BY HOLBEIN. 4*s.* 6*d.* AND 2*s.* 6*d.*
TRADITIONAL NURSERY SONGS, WITH 8 NEW PICTURES. 4*s.* 6*d.* AND 2*s.* 6*d.*
LITTLE RED RIDING HOOD, WITH 4 NEW PICTURES. 3*s.* 6*d.* AND 2*s.*
SIR HORNBOOK: AN ALLEGORICAL BALLAD, WITH 8 PICTURES. 4*s.* 6*d.* AND 2*s.* 6*d.*
Works in preparation:
THE PLEASANT HISTORY OF REYNARD THE FOX, TOLD BY EVERDINGEN'S PICTURES. 4*s.* 6*d.*
BALLAD OF CHEVY CHASE, WITH FOUR NEW PICTURES. 3*s.* 6*d.* AND 2*s.*
BEAUTY AND THE BEAST, WITH FOUR NEW PICTURES. 3*s.* 6*d.* AND 2*s.*
TESSELATED PASTIME, WITH NUMEROUS PATTERNS. 5*s.* AND ABOVE.
JACK AND THE BEAN STALK, A NEW EDITION, WITH 4 NEW PICTURES. 3*s.* 6*d.* AND 2*s.*
BOX OF TERRA COTTA BRICKS, GEOMETRICALLY MADE. 10*s.* 6*d.* AND UPWARDS.
PUBLISHED BY JOSEPH CUNDALL, 12, OLD BOND-STREET, LONDON.

8, New Burlington-street, September 22, 1843.
MR. BENTLEY HAS JUST PUBLISHED
THE FOLLOWING NEW WORKS:
I.
In 1 vol. post 8vo.
LETTERS FROM NEW YORK. By Maria Child, Author of 'The Mother's Book,' 'The Girl's Book,' 'Philothea,' &c.
II.
In 3 vols. post 8vo.
WYANDOTTE; or, THE HUTTED KNOLL. A Romance. By J. FENIMORE COOPER, Esq. Author of 'The Pilot,' 'The Spy,' 'The Jack O'Lantern,' &c.
III.
Hudson's Bay Company.
In 1 vol. 8vo. with Maps, by Arrowsmith,
2. NARRATIVE OF THE DISCOVERIES ON THE NORTH COAST OF AMERICA; EFFECTED BY THE OFFICERS OF THE HUDSON'S BAY COMPANY, during the Years 1836–39. By THOMAS SIMPSON.
IV.
In 3 vols. post 8vo.
THE BUSY BODY; a Novel.
V.
Now first published,
2 vols. 8vo. with Portraits from original Paintings, &c.
LETTERS OF HORACE WALPOLE, Earl of Orford, to SIR HORACE MANN, H.B.M. Resident at the Court of Florence, from the year 1760 to 1785. Printed from the Original MSS. Concluding Series.
VI.
In 3 vols. post 8vo. revised and corrected by the Author,
SECOND EDITION OF
SLICK IN ENGLAND; or, THE ATTACHÉ. By the Author of 'The Clockmaker; or, Sayings and Doings of Sam Slick of Slickville.'
VII.
2 vols. 8vo. with Portraits,
GEORGE SELWYN AND HIS CONTEMPORARIES, with MEMOIRS and NOTES. By J. HENEAGE JESSE, Esq. Author of 'Memoirs of the Court of England under the Stuarts,' and 'The Court of England under the Houses of Nassau and Hanover.'
ALSO, JUST READY.
I.
In 2 vols. 8vo. with Portrait,
MEMOIRS OF THE RIGHT HON. THE EARL OF ST. VINCENT, G.C.B. &c. By JEDEDIAH STEPHENS BUCKER, Esq.

13, Great Marlborough-street.

MRS. GORE'S NEW NOVEL,
'THE BANKER'S WIFE;
Or, COURT AND CITY,'
IS NOW READY AT ALL THE LIBRARIES, in 3 vols.

"A work of great and sustained interest—in our opinion the best production of Mrs. Gore."—*John Bull.*

"A very clever novel, clear, rapid, fluent—abounding in admirable sketches of manners."—*Spectator.*

"We do not hesitate to pronounce the work before us masterly. The cleverness of the opening portion of the story becomes absolute genius in the concluding scenes."—*Court Journal.*

Henry Colburn, Publisher, 13, Great Marlborough-street.

MRS. TROLLOPE'S NEW WORK.
Now ready, in 3 vols. with Illustrations by Leech,
THE BARNABYS IN AMERICA.
Being the Sequel of
'THE ADVENTURES OF THE WIDOW BARNABY.'
By Mrs. TROLLOPE.

"Mrs. Trollope is unquestionably one of the cleverest and most remarkable writers of the day."—*Quarterly Review.*

"The bouncing, tricky, and clever Mrs. Barnaby is undoubtedly Mrs. Trollope's *chef-d'œuvre.*"—*Court Journal.*

"We have had nothing so entertaining as 'The Barnabys in America' since the somewhat similar productions of Smollett."—*Naval and Military Gazette.*

Henry Colburn, Publisher, 13, Great Marlborough-street.

Now ready, the Second and Cheaper Edition, with numerous important Additions, the three volumes being comprised in two, price 21*s.* bound,
LETTERS OF
MARY, QUEEN OF SCOTS.
Edited, with an Historical Introduction and Notes,
By AGNES STRICKLAND.

"Undoubtedly the most valuable, and by far the most interesting work illustrative of the life and character of Mary Stuart, ever given to the world."—*Edinburgh Evening Post.*

"No public or private library can be considered complete without this valuable work."—*Morning Post.*

"The best collection of authentic memorials relative to the Queen of Scots that has ever appeared."—*Morning Chronicle.*

Henry Colburn, Publisher, 13, Great Marlborough-street.

FREEMASONS' and GENERAL LIFE ASSURANCE COMPANY, 11, Waterloo-place, Pall Mall, London.

Business transacted in all the branches and for all objects of LIFE ASSURANCE, ENDOWMENTS and ANNUITIES, and to secure CONTINGENT REVERSIONS, &c. Loans granted. Information and Prospectuses furnished by
JOSEPH BERRIDGE, Secretary.

YORK AND LONDON LIFE ASSURANCE COMPANY, King William-street, London. Empowered by Act of Parliament.
Directors.
George Frederick Young, Esq. *Chairman.*
Matthew Forster, Esq. M.P. *Deputy Chairman.*

The superiority of the system of Assurance adopted by this Company will be found in the fact that the premium required by a bonus office to assure 1,000*l.* on the life of a person in the 20th year of his age, would in this office insure 1,231*l. 7s. 6d.*

Assurances at other ages are effected on equally favourable terms, and thus the assured has an immediate bonus instead of a chance dependent upon longevity and the profits of an office. In cases of assurance for a limited number of years, the advantage offered by this Company is still greater, no part of the profits of a bonus office being ever allotted to such assurances.

Prospectuses, containing tables framed to meet the circumstances of all who desire to provide for themselves, or those who may survive them, by assurance, either of fixed sums or annuities, may be had at the Office, as above, or of the agents.
J. REDDISH, Secretary.

THE WESTMINSTER and GENERAL LIFE ASSURANCE ASSOCIATION,
At the WESTMINSTER FIRE OFFICE,
No. 27, King-street, Covent-garden.

A DIVIDEND OF THE PROFITS OF THIS SOCIETY WAS DECLARED ON THE 1st JANUARY, 1842, by which an addition, amounting on the average to 45 PER CENT. on the Premiums received was made to all Policies entitled to share therein.

FOUR-FIFTHS, or 80 PER CENT. of the total profits, are divided among the Assured at intervals of five years; and all Policies on which two payments have been made, participate in the division.

The Profits respectively allotted may be received by the Assured in present money, by a reduction of the Annual Premium, or by adding to the Policy an equivalent reversionary sum.

All Persons Assured on their own lives for 1,000*l.* or upwards, have the right (after two Annual payments) to attend and vote at the General Meetings of the Society.
W. M. BROWNE, Actuary.

STANDARD LIFE ASSURANCE COMPANY. Head Office, 3, George-street, Edinburgh; London Office, 32, Lombard-street.

NOTICE.—DIVISION OF PROFITS.

The next Division of Profits falls to be made at 15th November, 1845; and persons assuring
BEFORE 15TH NOVEMBER, 1843,
secure one year's additional claim for Profits at that as well as at future divisions. On reference to the Tables of Bonus additions of other Offices, it will be seen that this Company's Policies possess very decided advantages, which will also be participated in by future Policies,—the rule being to add at each successive investigation a per centage, not merely for each year of the period from the last investigation, *but for each year during which the Policy has been in subsistence.* This principle, it will at once be perceived, is peculiarly favourable to that class of assurers who open Policies for family provisions.

Practical Examples of Benefits afforded by the Company.

Date of Policy.	Sum Assured.	Bonus Additions.	Loan which would be advanced by the Company. Age at Entry 40.	No Entry Money.
1825	£1000	£337 10	£296	
1826	1000	312 10	285	
1827	1000	287 10	335	
1828	1000	262 10	305	
1829	1000	237 10	275	
1830	1000	212 10	250	

Later Policies have also Large Additions.
Edinburgh, 3, George-street.
WILL. THOS. THOMSON, Manager.

Assurances can be effected with this Company in the most secret and confidential manner, as the Papers are not submitted to a Board of Directors in London.
32, Lombard-street. PETER EWART, Resident Sec.

PELICAN LIFE ASSURANCE OFFICES,
70, Lombard-street, and 57, Charing-cross.—Established 1797.
Directors.

Matthias Attwood, Esq. M.P.	Sir W. Heygate, Bart.
W. Stanley Clarke, Esq. F.R.S.	Kirkman D. Hodgson, Esq.
John Coope, Esq.	R. Henshaw Lawrence, Esq.
William Cotton, Esq. F.R.S.	J. Petty Muspratt, Esq.
Sir William Curtis, Bart.	George Shum Storey, Esq.
William Davis, Esq.	C. Hampden Turner, Esq.
J. A. Gordon, Esq. M.D. F.R.S.	Matthew Whiting, Esq.

The Plan of this Office will be found to comprise all the Solid Advantages of Life Assurance.

Persons have the option of insuring upon the Return or Non-Return Systems; and the Tables, which include Ascending and Descending Scales of Premium, have been framed to suit the convenience of all parties.

The Rates have recently been reduced agreeably to the most approved calculations; they are also verified by the experience of the Office during Forty Years, and are as low as consistent with safety; those adapted to the RETURN SYSTEM entitle its assured to an equitable participation in the surplus premium, according to the plan detailed in the Company's prospectus.

The Assured under both Systems will possess the guarantee of a large PAID-UP Capital, and the further security of a responsible body of Proprietors, without being exposed to the liabilities of partnership.

Policies are purchased on liberal terms when the object of an assurance is effected;—or, loans will be granted thereon to the extent of five-sixths of such purchase-money.

Prospectuses and every information obtained on application at the Offices as above, or to the Agents of the Company appointed in every City and principal Town in the Kingdom.
R. TUCKER, Secretary.

UNIVERSAL LIFE ASSURANCE SOCIETY,
1, KING WILLIAM-STREET, LONDON.
Directors—Sir Henry Willock, K.L.S. *Chairman.*
John Stewart, Esq. M.P. *Deputy Chairman.*

Major-Gen. Sir Rd. Armstrong, C.B. K.C.T. & S.	William Kilburn, Esq.
John Bagshaw, Esq.	Francis Macnaghten, Esq.
Augustus Bosanquet, Esq.	Charles Otway Mayne, Esq.
Charles Dashwood Bruce, Esq.	Robert Saunders, Esq.
Ellis Watkin Cunliffe, Esq.	James Duncan Thomson, Esq.
Raikes Currie, Esq. M.P.	Capt. Samuel Thornton, R.N.

The principle adopted by the Universal Life Assurance Society of an annual valuation of assets and liabilities, and a division of *three-fourths of the profits* among the assured, is admitted to offer great advantages; especially to those parties who may wish to appropriate their proportion of profit to the reduction of future premiums.

The following table will show the result of the last division of profits, as declared on the 10th of May, 1843, to all persons who had on that day paid six annual premiums:—

Age when Policy was issued.	Date of Policy.	Sum Assured.	Original Premium.	Reduced Annual Premium.
20	On or before 10th of May, 1838.	£1,000	£19 6 8	£9 13 4
30		1,000	24 8 4	12 4 2
40		1,000	31 10 0	15 15 0
50		1,000	42 15 0	21 7 6
60		1,000	66 11 8	33 5 10

(By order of the Board)
DAVID JONES, Actuary.

SCOTTISH (WIDOWS' FUND) ASSURANCE SOCIETY, constituted by Act of Parliament.
ESTABLISHED A.D. 1815.
General Principles of the Society.

The Principles of this Society are those of Mutual Assurance, or, as it has been more properly termed, Mutual Contribution. The Members are their own Assurers. They are the Proprietors—the Sole Parties interested in the Funds; and, although by the Articles of Constitution, no Member is personally responsible for any Sum of Money beyond the Contribution conditioned to be paid by him in his Policy, the stability of the Society is amply provided for and secured by the salutary Regulation,—That at each Period of Investigation, one-third of the ascertained Profits shall be set aside and retained as a Guarantee Fund.

Practice of the Society.

Whilst this Society owes very much unquestionably to the Equity of the Rules and Principles upon which it has been established, some share of its popularity is attributable to the manner in which these Rules and Principles are practically carried out. The tables and calculations are all founded upon data which the long and successful experience of the Equitable Society of London has shown may confidently be relied upon as safe.

Although almost universally practised by other Offices, and although it unquestionably adds considerably to their business, the system of *bribing* parties unconnected with the Office, by the offer of a Commission on all business introduced through their medium or influence, is not countenanced by this Society. The Directors have always looked upon it as a practice which, for many reasons, is equally to be deprecated in the Company or Society offering, and in the party accepting, the bribe.

One of the great characteristics of the Society is the liberal, punctual, and simple manner in which the claims are settled, combined with the very great care bestowed by the Directors, (with the advice and assistance of the Medical Officers,) in the selection of lives. Instead of affording every facility to parties to join the Society, and afterwards throwing all manner of unnecessary obstacles in the way of settlement, when the claim emerges, the Directors proceed upon the opposite principle of being most cautious and particular in their inquiries before admitting members to the benefits of the Society; but, after being admitted, they are entitled to all the advantages which the Society affords; and when the claim emerges, no undue delay takes place, and no difficulties which can be avoided are interposed to prevent an easy and expeditious settlement.

The utmost care is bestowed upon the Investment and Accumulation of the Funds; many advantageous opportunities, which are not open to others, being afforded to this Society, in the large amount of its capital, and its rapidly increasing annual revenue.

Forms of Proposal, and all farther information, may be had on application at the Head Office, or at any of the Society's Agencies. JOHN MACKENZIE, Manager.

LONDON OFFICE, 7, Pall Mall,
HUGH M'KEAN, Agent.

OLD GILDING, LACKER, and BRONZE, however dirty, faded, or tarnished, rendered equal to new by UPTON'S PARISIAN DETERGENTS. The effect is sudden, astonishing, and lasting; trouble merely sponging the surface, and the expense only a few pence for the largest gilt frame, and the merest trifle for lackered articles. Fly spots are at once removed from gilding; no necessity, therefore, to cover from the fly. Gold detergent, 2*s.* 6*d.* per bottle; lacker and bronze, 1*s.* 6*d.*; lamp, 1*s.* 4*d.* All are innoxious and inoffensive. Sold by Upton & Co., Lamp-manufacturers, 33, George-street, Hanover-square, and 65, Basinghall-street, City. Established nearly 40 years. A trial allowed free of all charge. Trade supplied.

REALLY WATERPROOF.

BERDOE'S VENTILATING WATERPROOF FROCK.—This established and gentlemanly garment has already been adopted by a long list of the Nobility, Gentry, Professional Gentlemen, &c., and will prove well deserving the attention of all who regard a respectable and gentlemanly appearance in opposition to slang, vulgarity, and meanness. Made to measure in the first style; but a large assortment always ready, of which an inspection is confidently invited. Warranted waterproof, without confining perspiration.

Made only by W. Berdoe, Tailor, Waterproofer, &c. 69, Cornhill, eight doors from Bishopsgate-street.

MOULD CANDLES to BURN WITHOUT SNUFFING.—KEMPTON'S PATENT.—These candles do not require snuffing; they burn longer and are cheaper than any other candle; the flame is steady and brilliant. No metallic or deleterious matter is used in the manufacture. Price 8*d.* per lb. Sold by G. E. Parish, agent for exportation, 21½, Bread-street, City, and by Slodden & Stocking, 43, High-street, Marylebone; W. Gethem, Broadley-terrace, Blandford-square; W. Evans, Italian warehouse, Greenwich; John Hawkins, grocer, High-street, Whitechapel; George Hawley, grocer, Pitfield-street, Hoxton; S. Game, Fish-street-hill; J. Pain, grocer, Bethnal-green-road; G. H. Hudson, 229, Blackfriars-road; C. H. Nicholas, 19, Bolingbroke-row, Walworth; and at the manufactory, Old Bargehouse, Christchurch, Surrey.

WATCHES by WEBSTER & SON, Chronometer Makers to the Lords of the Admiralty (Established 132 years), 3, BIRCHIN-LANE. The largest assortment of fine Second-hand Watches of any house in London, by the most eminent makers—many nearly equal to new, and at little above half their original cost, all of which W. & Son warrant. They consist of fine Repeaters, Duplex, Lever, and Horizontal Escapements, all of superior manufacture. New Watches of the most elegant patterns upon the principle of their Chronometers, to which the Government awarded the prizes three years in succession, with compensation balances to counteract the variations of temperature. Also a large assortment of Lever and elegant Horizontal Watches, for Ladies and Gentlemen, at considerably reduced prices. Old Watches taken in exchange. The most experienced workmen are employed on the premises in the repairing department.
Webster & Son, 3, Birchin-lane, Cornhill.

H. WALKER'S NEEDLES (by authority The 'Queen's Own') in the illustrated Chinese boxes, are now in course of delivery to the trade. The needles have large eyes, are easily threaded (even by blind persons), and have improved points, temper, and finish. Each paper is labelled with a likeness of her Majesty or his Royal Highness Prince Albert, in relief on coloured grounds. Every quality of needles, fishhooks, books and eyes, steel pens, &c., for shipping. These needles or pens for the home trade are sent, free, by post, by any respectable dealer, on receipt of 13 penny stamps for every shilling value.—H. Walker, Manufacturer to the Queen, 20, Maiden-lane, Wood-street, London.

BUTTER MADE IN TEN MINUTES, by the NEWLY-INVENTED CHURN, registered according to Act of Parliament.
ATTWOOD, WIMBLE & WARNER, Manufacturers, LEWES, Sussex.

This CHURN being made entirely of Block Tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which insures the butter coming in ten or twelve minutes. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use. The great advantages of this Churn will be found in the winter; but in the summer, placing the churn in cold water will be the means of hardening the butter.

Sizes,	No. 1,	2,	and 3,
Churn from	7 to 8 lbs.	13 to 15 lbs.	26 to 28 lbs.
Price, carriage paid to London,	25*s.*	35*s.*	42*s.*

Metal Pans for Churns to stand in, 4*s.* 6*d.*, 6*s.*, and 7*s.* Larger sizes made to order.

To be seen in London, at Wright's Range Warehouse, No. 3, Arthur-street, near the Monument; W. Bally & Son, Furnishing Ironmongers, 71, Gracechurch-street; Livermore & Son, Ironmongers, No. 30, Oxford-street; Benham, 19, Wigmore-street, Cavendish-square. Export Agents, Barnes & Co., 109, Fenchurch-street.

TO MERCHANTS, FACTORS, IRONMONGERS, AND OTHERS.

THE OMBROSOME, or PATENT PORTABLE SHOWER BATH, peculiarly adapted for Travellers and Exportation.—This Bath is distinguished from every other by its combination of force with portability, its entire freedom from the dark and suffocating properties of the latter, the inexhaustible stream it produces from a few quarts of water, and the facility which it gives for converting the common fresh water shower into a saline or any other variety of bath. The height of the shower may be increased or lessened. It is also an excellent Douche Bath. Being nearly as small as a writing desk when packed, it will be found very advantageous for exportation. The apparatus is made entirely of brass, and beautifully finished and lackered. Manufacturers, Messrs. YATES & BIRCH, 42, Coleshill-street, Birmingham. May be seen at the Royal Polytechnic Institution, London; and be had at Messrs. Mapplebeck & Lowe, Bull Ring, Birmingham, and all the principal Ironmongers in the Kingdom. Price 4*l.* 10*s.*, and 5*l.* 5*s.*

THE OMBROSOME, or PATENT PORTABLE SHOWER BATH, especially adapted for travelling and exportation. By this Bath an inexhaustible shower is produced from a few quarts of water: the height of the shower may be increased or lessened to suit adults or children, and occupying so little room, is peculiarly suited for bed-rooms and dressing-rooms; it is also an excellent Douche Bath. Being little larger than a writing-desk when packed, it will be a great desideratum for exportation to India and other hot climates. To Military Men and others of a migratory life, also to Students of the Universities, Inns of Court, &c. (where rooms are low and water scarce), the present invention cannot fail to be most acceptable. It is made entirely of brass, and is at once simple and elegant.—May be seen at the Royal Polytechnic Institution; and be had, with Prospectuses, wholesale and for exportation, at the Manufactory, 115, Old-street; and retail at the Bazaar, Panklibanon Iron Works, 56, Baker-street; Mr. J. L. Benham, 19, Wigmore-street; Mr. C. Bray, 16, Cranbourne-street; Mr. J. Deacon, 4, Moorgate-street; Mr. J. Evans, London Bridge; Messrs. Fallows & Adcock, 4, Halkin-street West; Messrs. Glenton & Chapman, 147, New Bond-street; and of all the leading Ironmongers throughout England.—Price 4*l.* 10*s.* and 5*l.* 5*s.*

NORTON'S CAMOMILE PILLS are confidently recommended as a simple, but certain remedy, to all who suffer from Indigestion, Sick Headach, Bilious and Liver Complaints; they act as a powerful tonic and gentle aperient, imparting strength to the stomach, and composure to the nervous system. Sold in bottles, at 1*s.* 1½*d.* or 2*s.* 9*d.* each, by A. Willoughby & Co., late B. G. Windus, 61, Bishopsgate Without; and nearly all Medicine Venders.

On the 1st of October will be published, to be continued every alternate Month,

THE FIRST NUMBER OF

THE BARONIAL HALLS,

Picturesque Edifices,

AND

ANCIENT CHURCHES OF ENGLAND;

FROM DRAWINGS MADE EXPRESSLY FOR THE WORK BY J. D. HARDING, AND OTHER EMINENT ARTISTS:

The whole executed in Litho-tint by Mr. Harding.

WITH DESCRIPTIVE LETTER-PRESS, AND NUMEROUS ENGRAVINGS ON WOOD.

EDITED BY S. C. HALL, F.S.A.

Mode of Publication.

The size of the Work will be Imperial Quarto; and its production will be in all respects commensurate with the importance of the subject and the advanced state of the graphic and typographic arts. Each Part will contain Three Subjects, executed in LITHO-TINT—the patent invention of Mr. HULLMANDEL—a method peculiarly suited to such a publication, as combining accuracy of detail with brilliant artistic effects, and having also the advantage of novelty.

Woodcuts, when desirable to elucidate the text, or to convey accurate ideas of striking details, will be scattered through the letter-press, which will consist of Twelve pages,—sufficient, it is believed, to furnish all necessary information to the general reader.

PRINTS, Imperial Quarto .. .. *Five Shillings.* | PROOFS, Columbier Quarto .. .. *Seven Shillings and Sixpence.*

PROOFS, Imperial Folio, to range with Nash's Mansions, and other Works of the same size .. .. .. *Twelve Shillings.*

PART I. contains

COBHAM HALL, KENT	J. D. HARDING.
COBHAM CHURCH, INTERIOR	J. D. HARDING.
WEST-STOW HALL, SUFFOLK	W. MÜLLER.

THE FOREIGN LIBRARY.

A SERIES OF TRANSLATIONS OF

POPULAR AND INTERESTING FOREIGN WORKS,

To be published as soon as possible after their appearance on the Continent.

"The project of a FOREIGN LIBRARY we thought in the first instance very highly of, and are particularly glad to observe its confirmed success. The books have been well chosen, and, without an exception, well translated."—*Examiner.*

VOLUMES COMPLETED.

In 8vo. price 11*s.* cloth,

LIFE IN MEXICO.

By MADAME CALDERON DE LA BARCA.

With a PREFACE by W. H. PRESCOTT,
Author of 'The History of Ferdinand and Isabella of Spain.'

"Madame Calderon's book has all the natural liveliness and tact, and readiness of remark, which are sure to distinguish the first production of a clever woman.....Never was traveller better qualified for such a task in such a country, as far as physical resources, courage, and curiosity could go.—A more genuine book, in air, as well as reality, it would be difficult to find."—*Edinburgh Review.*

In 8vo. price 10*s.* cloth,

CELEBRATED CRIMES,

By ALEXANDER DUMAS,

Containing THE BORGIAS—THE COUNTESS OF SAINT GERAN—JOAN OF NAPLES—NISIDA—THE MARCHIONESS OF BRINVILLIERS—THE CENCI—THE MARCHIONESS DE GANGES—KARL LUDWIG SAND—VANINKA—URBAN GRANDIER.

"Dumas' book is very striking. The Tragedy of Truth—the serious side of what is called the Romance of Real Life—had never such startling illustration as this remarkable book affords. Its capital constructive art is only a less admirable feature than its perfect and close fidelity of detail. What a story is that of the Marchioness de Ganges!"—*Examiner.*

In 8vo. price 11*s.* cloth,

AUSTRIA. By J. G. KOHL.

Comprising VIENNA—PRAGUE—HUNGARY—BOHEMIA—THE DANUBE—GALICIA—STYRIA—MORAVIA—BUKOVINO, and the Military Frontier.

With a Map, in 8vo. price 11*s.* cloth,

RUSSIA. By J. G. KOHL.

Comprising ST. PETERSBURG—MOSCOW—KHARKOFF—RIGA—ODESSA—THE GERMAN PROVINCES ON THE BALTIC—THE STEPPES—THE CRIMEA, and the Interior of the Country.

"This book gives the clearest insight into Russian habits, manners, and general statistics, of any work on the subject which we have hitherto consulted. Though sometimes minute, M. Kohl is never tedious, because he always manages to combine, with the most trifling matter, allusions or comparisons that make it interesting, from the vivid manner in which it is conveyed to the reader's mind."—*Chambers' Edinburgh Journal*, Jan. 28.

PART VIII., price *5s.*

SCHLOSSER'S HISTORY OF THE EIGHTEENTH CENTURY,

Part the First. Translated by DAVID DAVIDSON, M.A.
Under the immediate Superintendence of the Author.

The Literary Portion of the History will appear first, and form Four Parts, or Two Volumes, 8vo., with an entirely new Introduction by the Author, and with a Preface and Notes by the Translator.

PREPARING FOR IMMEDIATE PUBLICATION.

ENGLAND, IRELAND, AND SCOTLAND.

By J. G. KOHL.

To form Four Parts of the FOREIGN LIBRARY.

HOURS OF MEDITATION AND DEVOTIONAL REFLECTION,

Upon various subjects connected with the Religious, Moral, and Social Duties of Life. By H. ZSCHOKKE. Translated from the German by JAMES D. HAAS.
Small 8vo. *7s. 6d.* (In a few days.)

A MANUAL OF FRESCO AND ENCAUSTIC PAINTING;

Containing ample Instructions for carrying on all the Operations connected with these Arts; with an accurate Description of the Methods employed, and the Colours and other Materials used, by the most Eminent Artists of Ancient and Modern Times.

By W. B. SARSFIELD TAYLER,
Curator of the Living Model Academy. Post 8vo.

CHAPMAN & HALL, 186, *STRAND.*

London: JAMES HOLMES, 4, Took's Court, Chancery Lane. Published every Saturday, at the ATHENÆUM OFFICE, 14, Wellington-street North, Strand, by JOHN FRANCIS; and sold by all Booksellers and Newsvenders.—Agents: for SCOTLAND, Messrs. Bell & Bradfute, Edinburgh:—for IRELAND, J. Cumming, Dublin.

RESIDENCE of STUDENTS.—Several of the Professors, and some of the Masters of the Junior School, receive students to reside with them; and in the office of the College there is kept a register of parties unconnected with the College who receive boarders into their families; among these are several medical gentlemen. The register will contain references as to respectability, terms, and other particulars.

FLAHERTY SCHOLARSHIPS.—A Flaherty Scholarship of 50l. per annum, tenable for four years, will be awarded in 1844 to the best proficient in Mathematics and Natural Philosophy among the Students of the College under the age of 20 years. The examination will take place in the second week in January. A similar Scholarship for proficiency in Classics will be awarded in 1845, and in subsequent years, alternately, for proficiency in Classics, and in Mathematics and Natural Philosophy.

Printed copies of the Regulations concerning the Scholarships may be had on application at the office.

The Session of the Faculty of Medicine commences on the 2nd of October.

The Junior School opens on the 25th September.

Prospectuses and further particulars may be obtained at the office of the College.—September, 1843.

GEORGE LONG, A.M., Dean of the Faculty.
CHAS. C. ATKINSON, Secretary to the Council.

MR. NORTH will commence his next Course of LECTURES on MIDWIFERY and the DISEASES of WOMEN and CHILDREN, at the MIDDLESEX HOSPITAL SCHOOL OF MEDICINE, on TUESDAY, the 3rd of October, at 10 o'clock.—For particulars apply to the Secretary, at the Hospital; or to Mr. North, 18, King-street, Portman-square.

PRIVATE TUTOR.—A VACANCY is now open for a PUPIL in the family of a Clergyman of long experience residing 12 miles from London, the number of whose Pupils does not exceed five or six. He can offer the most satisfactory references to gentlemen whose sons have been under his care.—Letters to be directed for the Rev. R. H., Post-office, Petersham, Surrey.

GRADUATION IN ARTS, &c.—Gentlemen of liberal education and pursuits may, through the assistance of the Advertiser, obtain a Degree in any Faculty for which their previous education may have qualified them. The Exercises, amount of Fees, &c., will be communicated in answer to all letters, giving particulars of applicant's status and education.—Address (pre-paid) to M. D., at Messrs. Nock's, Booksellers, 15, Tottenham-court New-road.

HANWELL COLLEGIATE SCHOOL, Middlesex. Principal, the Rev. J. A. EMERTON, M.A., Curate of Hanwell, Middlesex.—Parents and Guardians desirous of selecting a School in a healthy situation, combining the intellectual advantages of a Collegiate Course with Religious Instruction, Moral Training, and Domestic Care, may obtain Prospectuses on application to the Rev. Dr. Walmsley, Rectory, Hanwell; J. D. Macbride, Esq., D.C.L., Principal of Magdalene Hall, Oxford; or of the Principal, at the School.

EDUCATION.—HOPWYL HOUSE, STAMFORD HILL, MIDDLESEX.—At this Establishment YOUNG GENTLEMEN are EDUCATED on plans founded on the principles so successfully practised by PESTALOZZI and DE FELLENBERG. The most assiduous attention is bestowed on the culture of the feelings, the developement of the mental faculties, and the general improvement of the health and physical capabilities.—Knowledge is presented in its simplest form, and every exertion is made to render its acquirement a source of pleasure and a means of further progress in virtue and intelligence.

The course of instruction includes the English, French, German, Latin, and Greek Languages; the Mathematics, Experimental Philosophy and Chemistry; the Elements of Natural and Civil History, Geography and Astronomy; Writing, Drawing, Singing, Gymnastics, &c.

To facilitate the acquirement of knowledge, and furnish means of general improvement, a select library is provided, and an extensive collection of philosophical and chemical apparatus, with cabinets of minerals, shells, &c.; a laboratory, bath, workshop, &c.

TERMS, including every expense, from Six to Eight Guineas per Quarter.

A Prospectus may be obtained at Messrs. Jones's, 30, Lower Holborn; or at the Establishment.

MADRIGAL CLASS.

CROSBY HALL, BISHOPSGATE-STREET WITHIN.

MR. WRIGHTON begs to inform the Public that he has taken this ancient and spacious Hall for the practice of Madrigals, Glees, &c., which will commence on MONDAY EVENING, October 9, at 8 o'clock. Ladies and Gentlemen desirous of joining, are requested to apply at the Hall on the evening of Monday, October 2, and Friday, October 6.—Terms One Guinea per annum, payable half-yearly in advance.

FRESCO AND ENKAUSTIC ORNAMENTAL PAINTING.

MR. FREDERICK SANG, Artist, from the Royal Academy at Munich, begs to inform the Nobility and Gentry (Architects particularly), that he continues, with a considerable number of his Pupils, to decorate Public and Private Buildings in the above manner, and in the different ancient and modern styles, on reasonable terms, and with the greatest dispatch. Orders executed in all parts of the United Kingdom.—Apply by letter to Mr. Frk. Sang, 27, Porland-terrace, Regent's-park, London.

ART-UNION of LONDON, 4, TRAFALGAR-SQUARE.

President—His Royal Highness the Duke of Cambridge.
Vice-President—The Most Noble the Marquis of Northampton, P.R.S.

Subscribers of the current year will receive for each Guinea paid, in addition to the chance of obtaining a valuable Work of Art, an impression of a Line Engraving by Mr. E. Goodall, from the Picture by Clarkson Stanfield, R.A., 'CASTELLO D'ISCHIA,' and a series of 22 Designs in Outline, engraved by Mr. Henry Moses, from Original Drawings made expressly for the Society by Mr. H. C. Selous, illustrative of the 'PILGRIM'S PROGRESS.' Several of the Outlines are already engraved, and the Committee invite an immediate subscription to enable them to make the necessary arrangements for their prompt distribution.

The Engraving, after Hilton's 'UNA ENTERING THE COTTAGE,' due to the Subscribers of 1842, may now be obtained at the Office, on presentation of the "order," by those who have not already received the print.

GEORGE GODWIN, F.R.S. F.S.A.
LEWIS POCOCK, F.S.A. } Hon. Secs.
26th Sept. 1843.

PARTNERSHIP.—TO CIVIL ENGINEERS, SURVEYORS, AND LAND AGENTS.

A GENTLEMAN, aged 30, of good business habits, and having the command of a small amount of capital, is desirous of a PARTNERSHIP of the above description. The Advertiser was educated as a Civil Engineer and Surveyor, and has had very considerable experience in the construction of several of the leading Railways in the Kingdom. He has also some knowledge of Architecture and Buildings, and wishes now to become connected with an established business, where his professional knowledge and experience may be of service.

References of the highest respectability will be given to Gentlemen under whom the Advertiser has been at various times engaged.—Address G. L., care of Mr. J. Clayton, 320, Strand, London.

OWEN'S BRITISH FOSSIL MAMMALIA.—The Publication of Part I. of Professor Owen's 'History of British Fossil Mammalia' is deferred till the 1st of January. The future Parts, price 2s. 6d. each, will appear Monthly.

John Van Voorst, 1, Paternoster-row.

TERMS FOR THE PERUSAL OF NEW PUBLICATIONS.

Prints, Imperial Quarto, 3s.; Proofs, Columbier Quarto, 7s. 6d.; Proofs, Imperial folio, to range with Nash's Mansions, and other Works of the same size, 12s.

London: Chapman & Hall, 186, Strand.

NEW WORK ON THE COLONIES.

Second Edition, now ready, in 3 vols. post 8vo.

TALES OF THE COLONIES; or, The ADVENTURES of an EMIGRANT.

By CHARLES ROWCROFT, Esq.
A late Colonial Magistrate.

"This is a book full of adventure and information. The manner, too, is as good as the matter."—*Athenæum.*

"The author's matter is solid and real—the history of a settler in Van Diemen's Land from the early formation of the colony till nearly the present time."—*Spectator.*

"Since the time of 'Robinson Crusoe' literature has produced nothing like these Tales of the Colonies."—*Metropolitan.*

"No mere romance—no mere fiction, however skilfully managed or powerfully executed, can surpass it. The work to which it bears the nearest similitude is 'Robinson Crusoe,' and it is scarcely, if at all, inferior to that extraordinary work. The character of Crab is equal to anything in Sam Slick or Box. Truth is stamped upon every feature."—*John Bull.*

Saunders & Otley, Publishers, Conduit-street.

This day is published, in royal 4to. with 17 Plates and 38 Woodcuts, price 25s.

PROPORTION, or the GEOMETRIC PRINCIPLE of BEAUTY, ANALYSED. By D. R. HAY, Decorative Painter to the Queen, Edinburgh.

Lately published, by the same Author,

I.

The Natural Principles and Analogy of the Harmony of Form. In 1 vol. royal 4to. with 18 Engravings and Woodcuts. Price 15s.

II.

The Laws of Harmonious Colouring adapted to Interior Decorations. The 4th edition, with 8 coloured Diagrams. 8vo. Price 7s.

William Blackwood & Sons, Edinburgh, and 22, Pall Mall, London.

This day is published, price 4s.

RACHEL OF PADANARAM,
TYPE OF THE CHURCH.
A Sacred History from the Mosaic Record.
By WILLIAM ARCHER.
"Rachel Typus Ecclesiæ."—*St. Ambrose.*
London: Simpkin, Marshall & Co. Stationers'-court; and sold by all Booksellers.

SCHREVELIUS' GREEK AND ENGLISH LEXICON.
New and Enlarged Edition.

SCHREVELIUS' GREEK and ENGLISH LEXICON (Valpy's), with many new Words, added by Dr. MAJOR, Head Master of King's College, London. 5th edition, materially improved, not only by the addition of many new Words, in particular from Pindar, the three Tragedians, Aristophanes, Ap. Rhodius, Herodotus, and Xenophon, but by a large increase of Meanings; thus rendering the work applicable to a greater number of Authors, and leaving no desideratum for all the purposes of a School Lexicon. 8vo. 15s. cloth lettered.
London: Robert Baldwin; Whittaker & Co.; and Simpkin, Marshall & Co.

NEW EDITIONS of DR. COMBE'S WORKS.

1. On the Management of Infancy. 3rd edition, improved. 1 vol. 12mo. price 6s.
2. Physiology applied to Health and Education. 1 vol. post 8vo. 11th edition, enlarged, with Woodcuts, 7s. 6d.
3. On Digestion and Diet. With 12 Woodcuts. 4th edition. 1 vol. post 8vo. price 7s. 6d.
The above works are intended chiefly for the use of parents, teachers, and the young. That they have not been unsuccessful in their aim is proved by their wide circulation, not only in this country and the United States, but also on the Continent, in German and Danish Translations.
Maclachlan, Stewart & Co. Edinburgh; Simpkin, Marshall & Co. London; and all other Booksellers.

SUMMERLY'S

LONDON.

MEDICAL AND SURGICAL WORKS AT REDUCED PRICES.

CELSUS on MEDICINE, in Eight Books, Latin and English. Translated from L. TARGA'S Edition, the words of the Text being arranged in the Order of Construction. With a Life of the Author, Tables of Weights and Measures, explanatory Notes, &c., designed to facilitate the Progress of Medical Students. By ALEX. LEE, A.M., Surgeon. The two volumes, 8vo., published at 1l. 13s. done up in *one volume*, and reduced to 12s. cloth. A few copies of the Second Volume may be had separately, published at 18s., reduced to 7s. cloth.

2. The New London Dispensatory; containing a Translation of the Pharmacopœia Londinensis, &c. Second Edition, with a Translation of MAGENDIE'S FORMULARY for the Preparation and Employment of several New Remedies. By Thomas Cox, M.D., and C. W. Gregory, M.D. 8vo. published at 14s., reduced to 6s. cloth.

3. The British Flora Medica; or, History of the Medicinal Plants of Great Britain. With nearly 100 coloured Figures. By Ben. H. Barton, F.L.S., and Thomas Castle, M.D. F.L.S. 2 vols. 8vo. published at 2l. 6s., reduced to 1l. 8s. cloth.

4. A Manual of Surgery, founded on the Principles and Practice lately taught by Sir A. Cooper, Bart. F.R.S., and J. H. Green, Esq. F.R.S. Fourth edition, enlarged, with Plates. Edited by Thomas Castle, M.D. F.L.S. Royal 18mo. published at 10s. 6d., reduced to 5s. cloth.

5. An Introduction to Medical Botany; comprehending the Elements and Glossology of Botany; the Linnean Artificial and Natural Systems; the Natural System of Jussieu, &c. With coloured Figures. Third edit. By Thomas Castle, M.D. F.L.S. 18mo. published at 6s., reduced to 4s. cloth.

6. The Obstetrician's Vade Mecum; or, Aphorisms on Natural and Difficult Parturition. By Thomas Denman, M.D. Considerably augmented, and arranged according to the present state of Obstetricy. By Michael Ryan, M.D. With Plates, 12mo. published at 9s., reduced to 4s. 6d. cloth.

7. A Treatise on Midwifery; developing new principles, which tend to lessen the suffering of the Patient, and shorten the duration of Labour. Second edition, improved, and illustrated with numerous Cases; comprising, also, additional observations on premature expulsion of the Ovum, and retention of the Placenta. By John Power, M.D., formerly Physician-Accoucheur to the New Westminster Lying-in Charity, and to the Dorcas Society. 8vo. published at 8s., reduced to 5s. cloth.

8. A Manual of Surgical Anatomy; containing a minute description of the Parts concerned in Operative Surgery, with the Anatomical Effects of Accidents, and Instructions for the Performance of Operations. By H. M. Edwards, D.M.P. Translated, with Notes, by William Coulson, late Surgeon to the General Dispensary, &c. 18mo. published at 7s., reduced to 3s. cloth.

London: Simpkin, Marshall & Co. Stationers'-hall-court.

New Works.

Just ready:—

I.

THOMAS MOORE'S POETICAL WORKS;

Containing the Author's recent Introductions and Notes. Complete in One Volume, uniform with Lord Byron's Poems. Medium 8vo. with a New Portrait, by George Richmond, engraved in the line manner, and a View of Sloperton Cottage, the Residence of the Poet, by T. Creswick, A.R.A., 21s. cloth.

II.

A PICTORIAL TOUR IN THE MEDITERRANEAN;

Comprising Malta, Dalmatia, Turkey, Asia Minor, Grecian Archipelago, Egypt, Nubia, Greece, Ionian Islands, Sicily, Italy, and Spain. By J. H. ALLAN, Member of the Athenian Archæological Society, and of the Egyptian Society of Cairo. Imp. 4to. with upwards of 40 Lithographed Drawings, and 70 Wood Engravings, 3l. 3s. cloth.

Just published:—

1.

THE BIOGRAPHICAL DICTIONARY

OF THE SOCIETY FOR THE DIFFUSION OF USEFUL KNOWLEDGE.

Half-Vol. V. ANTELMI to ARISTOPHANES, 8vo. 12s. cloth.

*** Half-Vols. I. to IV. 8vo. 12s. each, cloth. To be continued Quarterly.

2.

LECTURES ON POLARIZED LIGHT,

Delivered before the Pharmaceutical Society, and in the Medical School of the London Hospital. 8vo. illustrated by above 50 Woodcuts, 5s. 6d. cloth.

3.

A TREATISE ON PHOTOGRAPHY;

Containing the Latest Discoveries and Improvements appertaining to the Daguerréotype. By N. P. LERÉBOURS, Optician to the Observatory, Paris, &c. Translated from the New Paris Edition (the 4th) by J. EGERTON. Post 8vo. with Plate, 7s. 6d. cloth.

4.

THE HOME;

Or, FAMILY CARES AND FAMILY JOYS.

By FREDERIKA BREMER, Author of 'The Neighbours,' &c. Translated from the Swedish, by MARY HOWITT. 2nd edition, revised and corrected, 2 vols. post 8vo. 21s. boards.

"It is impossible to read this book as a piece of *make-believe*. We have had nothing so simply life-like since Galt's 'Annals of the Parish'—no pictures of female nature so finely touched, since Miss Austen's. As an illustration of northern life and manners, too, the tale has great value."—*Athenæum.*

By the same Author,

The PRESIDENT'S DAUGHTERS; including NINA. 3 vols. post 8vo. 31s. 6d. boards.

*** A Third Edition of 'The Neighbours' will be ready in a few days.

5.

THE EMPIRE OF THE CZAR;

Or, Observations on the Social, Political, and Religious State and Prospects of Russia, made during a Journey through that Empire. By the MARQUIS DE CUSTINE. Translated from the French. 3 vols. post 8vo. 31s. 6d. cloth.

"The Marquis is a shrewd, intelligent, and trustworthy observer of men and things, with a mind actively alert to whatever is curious and attractive. He has produced a pleasant book of travels, written with spirit and vivacity, and possessing merits of no common order."—*John Bull.*

6.

PERSONAL OBSERVATIONS ON SINDH:

The Manners and Customs of its Inhabitants, and its Productive Capabilities; with a Narrative of the Recent Events.

By CAPTAIN POSTANS,

Bombay Army, late Assistant to the Political Agent, Sindh.

8vo. with Map, coloured Frontispiece, and Illustrations on Wood. 18s. cloth.

"Captain Postans has written a very meritorious book on a topic of great general interest. His 'Personal Observations' contain a brief and striking summary of Sindhian history."
Examiner.

EDINBURGH REVIEW, No. CLVIII.

The EDINBURGH REVIEW will be published about the 12th of October. ADVERTISEMENTS cannot be received later than Thursday next, the 5th; and BILLS must be sent to the Publishers by Saturday next, the 7th.

London: Longman, Brown, Green, and Longmans.

REVIEWS

History of Letter Writing, from the Earliest Period to the Fifth Century. By W. Roberts, Esq. Pickering.

THE history of letter writing might be taken as one mode of illustrating the history of mankind, and a surer test of the progress of civilization can hardly be selected than the greater or less developement of this useful art: for art it is. The desire to communicate with distant friends must have arisen with the first separation of families; and occasional attempts to effect some correspondence must have been made before the invention either of alphabets or of regular roads. The frequency, however, and the fulness of this interchange of thought, must have depended jointly upon the possession of a facile and manageable alphabet, and of some tolerable roads with habitations at accessible distances along them. In the first of these necessities is implied the discovery of a light and pliant material for receiving the character, for the rounded or cursive form of letters is closely dependent on the possession of a substance that yields to a rapid motion of the hand. The discovery of paper (whatever may have been the matter of which it was composed) was a great epoch in the history of letter writing, and was a marvellous "easement" to the "absent lover" and the anxious friend. As long, however, as the means of transit continued uncertain and irregular, there was no temptation to writing for trivial purposes; and letters forwarded by special couriers would inevitably be confined to important communications. The establishment of regular posts must have early followed that of extended empires, when military necessities could not fail to turn attention to the means of constant communication with outlying provinces and distant armies. They may even have existed anterior to the invention of alphabets; for not only might verbal communications be thus maintained, but many conventional symbols, less precise than letters, but still sufficiently indicative, might be sent along an established line. The Peruvian government received drawings of the Spaniards, their ships, and arms, immediately on the arrival of those invaders at the coast,—the earliest specimens, we believe, of an "illustrated news." The quipo was another symbolical instrument. The poppy heads of Tarquin were yet ruder, but not less significant expressions of a sentiment. Particular signs, previously agreed on, would supply much military intelligence, without risk of its being intelligible if betrayed by the fortune of war, or the messenger, to the enemy. In early Greece, such a sign was the astragalus, which was broken in twain, and divided by host and guest at parting, as a token between them for the renewal of reciprocal hospitality personally (and probably by their recommendees). It is further probable, that even after the use of alphabets a symbolology, answering the purpose of a cipher, was in request for military correspondence. Such resources, however, are excessively limited in their applicability; and the invention of alphabetic writing must have preceded anything approaching to an extensive interchange of ideas.

It is needless to add, that a permanent government and peaceable rule are indispensable adjuncts to the material causes of a frequent epistolary correspondence. Such is the theory of the subject considered from its *à priori* side, and experience seems pretty accurately to agree in its results. On the other hand, the same diffused civilization, which gave birth to the mechanical facilities of intercourse, developed the occasions for frequent letter writing; and after military and state letters, commercial correspondence may be ranged the earliest in the chronological series. A familiar interchange by letter of personal sentiments and domestic intelligence among private friends, was, in point of fact, a practice of late date in all nations. But the art of letter writing, like all other arts, must have been the result of use and practice. An interchange of state papers must have had its conventional style; and the epistolary treatises of literary correspondents could not but have all the stiffness and formality of professional writing. It was not till trifles came to be discussed, that the easy, graceful, unornamented, but beautiful simplicity of true letter writing could have found an existence. Cicero was perhaps the first Roman who habitually corresponded in any frequency with his friends; and he seems to have been really the first to have reduced the practice to form and elegance. In the stiff and awkward letters of our own ancestors, with their long-winded directions, and more long-winded compliments, we have a vivid picture of the difficulty with which the practice of letter writing is accomplished by the unfrequent correspondent. There is not, perhaps, a more curious phenomenon in literature, than the graceful facility of Madame de Sévigné, whose contemporaries, whether nobles or pedants, were such pompous letter writers.

When once the practice of letter writing became common, the fitness of the epistolary form for the purposes of fiction could not fail to strike; and either as the base of a narrative, or as a mere exercise in the art, the composition of letters supposed to have passed to and from historical personages, became a recognized branch of the lighter literature. The more remote the antiquity of the supposed correspondents, the greater scope was left for the exercise of imagination, both as to facts and sentiments: such would, therefore, be preferably selected. Accordingly, many specimens of this genus existed in Greek literature; and the consequence has been that our author, who follows a chronological order in his illustrations, begins his work with a practical bull,—namely, the account of fabricated letters, which are, of course, no letters at all, but mere literary *jeux d'esprit*. The first of these which occurs are the letters attributed to Phalaris, about which so fierce a controversy once raged. Mr. Roberts (after two or three preliminary chapters on the subjects we have touched upon) commences his account of these letters with a bird's eye view of the debated points of the Bentley controversy, and then subjoins translated specimens of the forgery. He next proceeds to the Pythagorean correspondence, in our opinion still more obviously spurious. He has then a chapter on the letters of Themistocles, Socrates, Xenophon, and other Greeks, ending with Alciphron's epistles, which have no claim to a place in this collection. Then follow Genuine Heathen Greek Epistles —Early letter writing among the Romans— Letters of Cicero—of Augustus Cæsar—Seneca —the Younger Pliny—Letter writing from Pliny to the time of Philostratus (who flourished under Septimus Severus)—thence to the time of Libanius—and from the time of Libanius to that of Sidonius Apollinaris, which closes the volume. To give even the slightest account of the matter contained in seven hundred closely-printed pages would far exceed our limits. It is sufficient to say that the subject is worked out by striking specimens, and occasional comments and illustrations; and that the latter portion of the volume assumes a most decided religious character, as containing the correspondence of the Fathers, on which the author delights to expatiate. As a learned and miscellaneous compilation, the volume is generally commendable, but it is insufferably heavy reading. As a library book, for an occasional dip, or for consultation, it will be more acceptable; but they who expect in it a critical or æsthetic treatise on epistolary style, and the more celebrated letter writers in different ages, will be disappointed. That branch of the subject, however, may be reserved for future publication.

Original Letters of Eminent Literary Men of the 16th, 17th, and 18th Centuries: with Notes, by Sir H. Ellis. Printed for the Camden Society.

For those who delight in bibliographical lore, here is information concerning Camden's 'Britannia'—the wonder of its age,—and Sir Robert Cotton's noble collection of manuscripts. In the earlier part of the work the reader will find the letters of Cheke and Gilpin, Ascham, Nowell, Bodley, and Usher; while in the latter portion the familiar names of Tillotson, Prior, De Foe, Swift, Steele, Lardner, Cumberland, and Franklin, come laden with rich, and, in some instances, well-redeemed promise.

The College letters of Strype let us into the domestic economy of a Cambridge student in the reign of Charles the Second. They are addressed to his mother, and form a strange contrast to the letters of "university men" of our own days. The trifling sums on which men maintained themselves at College, and the difficulty many had in mustering even the small amount necessary, will surprise many of our readers. Strype thus writes to his mother about his Commons, which means (we explain for the benefit of the uninitiated) the eating and drinking department of College life:—

"Do not wonder so much at our Commons: they are more than many Colleges have. Trinity itself (where Herring and Davies are) which is the famousest College in the University, have but three half-pence. We have roast meat, dinner and supper, throughout the weeke; and such meate as you know I not use to care for; and that is Veal: but now I have learnt to eat it. Sometimes, neverthelesse, we have boiled meat, with pottage; and beef and mutton, which I am glad of; except Fridays and Saturdays, and sometimes Wednesdays; which days we have Fish at dinner, and tansy or pudding for supper. Our parts then are slender enough. But there is this remedy; we may retire unto the Butteries, and there take a half-penny loafe and butter or cheese; or else to the Kitchen, and take there what the Cook hath. But, for my part, I am sure, I never visited the Kitchen yet, since I have been here, and the Butteries but seldom after meals; unlesse for a Ciza, that is for a Farthing-worth of Small-Beer: so that lesse than a Peny in Beer doth serve me a whole Day."

Notwithstanding a gala day—"an exceeding" as they called it,—now and then, poor Strype begs hard of his mother for one or two delicacies—"a cake and a cheese, and a neat's tongue, or some such thing, if it would not require too much money." "If you are not too straight of money," he writes again, "send me some Orange pills by the woman and a pound or two of almonds and raisins." He thus gives an account of his mode of life:—

"We go twice a day to Chapel; in the morning about 7, and in the Evening about 5. After we come from Chapel in the morning, which is towards 8, we go to the Butteries for our breakfast, which usually is five Farthings; an halfepenny loaf and butter, and a cize of beer. But sometimes I go to an honest House near the College, and have a pint of milk boiled for my breakfast."

We think under-graduates of our days would shrink from the strict rendering of accounts required of the great annalist:—

"I know you expect I should tell you what is become o the money I brought along with me: and I will gladly satisfy you in any thing. Some of it is yet remaining in my hands ,for uses: and I question not but you are well contented I should have some-

Digitized by Google

thing laying by mee against necessity. Ten Shillings you know I paid out of it for the Horse I came from London upon. Another 10ˢ I gave to my taylor in part of payment for making my Sute. More of it went for Books, whereupon you see noe Books in my Bill. The remainder you may conclude is in my custody. Excuse, I beseech you, the largenesse of my taylor's Account, and it shall be less for the future. Bed-maker and Laundresse are set down for a whole Quarter: whereas I was absent a Month: so that what my Laundresse hath had overplus the last Quarter, shall be abated her for so much of this Quarter; and so I have turned her off: besides her loosing my linnen and washing dirtily, she hath also grosly abused me, and one or two others; but when all comes to all, hath worst of all abused and besooted herself: and all for a trifle, and most unjustly."

Nor was Oxford life more expensive. Lloyd, Bishop of St. Asaph, thus writes to Dr. Fell, Bishop of Oxford and Dean of Christ Church, begging for the gift of a studentship in that College for a dependent:—

"His poor Father can do nothing for him. And I know none els that will do any thing but myself. Here I keep him with very little charge; but to keep him at the University will be a charge greater than I can bear. But if he has a Student's place, I will strein hard to allow him 20ˡˡ. a yeer, which will give him a competent subsistence. For he eats but one meal a day, & thinks no clothes too mean for him to wear. I never knew one of his age a more perfect Philosopher. Pray my Lord, if you can finde a place for him, let me know when it will require him thether, that I may order things for it accordingly."

A short sketch of the origin of the 'Lady's Diary,' a work so noted in its day, with its contents, may not be unacceptable to the reader. It is given in a letter from Mr. Tipper, the projector, to Wanley, the antiquarian, and is dated Nov. 8, 1703:—

"I received yours, and thank you kindly for your advice and direction, for indeed I know nothing of the manner how a Dedication ought to be made, and what previous caution ought to be used. As for the Ladies Diary, it consists of a Preface to the Fair Sex, containing the Happiness of England under the Reign of Queen Elizabeth and the present Queen; with an Account of the subject of the present and future Almanacks (if any be); then follows a Copy of Verses in praise of the Queen which were actually spoken (with others) at the Maior's Parlour by one of the blewcoat Boys (at the last Thanksgiving day about the Vigo business) with universal applause. Then follows an Account of the Calendar at large. Then the Calendar it self on one side (of each leaf) and on the other side an account of Bills of Fare for each Month, and also Medicinal and Cookery receipts collected from the best authors. Then succeeds the Common Notes of the year, the four Terms, the Times when Marriage comes in and out, the Eclipses, &c. all in one page. After this is the second part of the Almanack, which contains the Praise of Women in general, with directions of Love and Marriage, intermixt with delightful stories. Then ensues the Marriage Ceremonies of divers Nations, together with several Enigmas, some explained and others omitted to be explained till next year (all this second Part is intermix'd with Poetry, the best of the kind to the best of my judgment); lastly is a Table of the Births of all the Crowned heads in Europe, with the time when they began to reign, and how long they have reigned. The Calendar part (I should have noted before) has a great variety of Particulars all at length, *because few women make reflections, or are able to deduce consequences from premises.* The Title-page is to this effect, 'The Lady's Diary or Women's Almanack; containing Directions of Love and Marriage, of Cookery, Preserving, Perfumery, Bills of Fare for every Month, and many other things peculiar to the Fair Sex;' and indeed is the First ever published of the kind. It contains no Secrets of Women, nor any expression to offend the chastest ear. Upon the Title-page is the Picture of the Queen in copper, which I am promised shall be (and I hope now is) very well performed. And thus you have an exact Table of the whole, which tho' it is not all fit for a Queen, yet it is all designed peculiarly for the Women."

In the year 1706, 4,000 copies of this work were printed, and "not one left by New Year's tide."

The following anecdote, regarding De Foe's 'Robinson Crusoe,' is from a manuscript of Thomas Warton's, now in the British Museum. Such was contemporary gossip; as if De Foe had never written anything but 'Robinson Crusoe':—

"Mem. Jul. 10, 1774. In the year 1759, I was told by the rev. Mr. Benjamin Holloway, rector of Middleton Stoney in Oxfordshire, then about seventy years old, and in the early part of his life domestic chaplain to Lord Sunderland, that he had often heard Lord Sunderland say, that Lord Oxford, while a prisoner in the Tower of London, wrote the first volume of the History of Robinson Crusoe, merely as an amusement under confinement; and gave it to Daniel De Foe, who frequently visited Lord Oxford in the Tower, and was one of his Pamphlet writers. That De Foe, by Lord Oxford's permission, printed it as his own, and encouraged by its extraordinary success, added himself the second Volume, the inferiority of which is generally acknowledged. Mr. Holloway also told me, from Lord Sunderland, that Lord Oxford dictated some parts of the Manuscript to De Foe. Mr. Holloway was a grave conscientious clergyman, not vain of telling anecdotes, very learned, particularly a good orientalist, author of some theological tracts, bred at Eton school, and a Master of Arts of St. John's College, Cambridge. He lived many years with great respect in Lord Sunderland's family, and was like to the late Duke of Marlborough. He died, as I remember, about the year 1761. He used to say that Robinson Crusoe, at its first publication, and for some time afterwards, was universally received and credited as a genuine history. A fictitious narrative of this sort was then a new thing."

We have among these letters more than one from Swift, asking for preferment.

"Pray, my Lord, desire Dr South to dy about the fall of the Leaf, for he has a Prebend of Westminster, which will make me your neighbor, and a sine-cure in the Country, both in the Queen's gift, which my friends have often told me would fitt me extremely; and forgive me one word, which I know not what extorts from me; that if my Lord President would in such a juncture think me worth laying any weight of his Credit, you cannot but think me persuaded that it would be a very easy matter to compass: and I have some sort of pretence, since the late King promised me a Prebend of Westminster, when I petitioned him in pursuance of a recommendation I had from Sir William Temple."

To descend a little later in history, we find Franklin giving an account to Sir Joseph Banks of the first balloon—"An experiment of a vast globe sent up into the air, much talk'd of at present, and which, if prosecuted, may furnish means of new knowledge."

The Abbé Mann, many of whose letters to Sir J. Banks are quoted in this volume, though stated in the 'Biographie Universelle' to have been a native of Austrian Flanders, was by his own account an Englishman, born in Yorkshire. Early in life he became a Romanist, and received some promotion in the Church. His letters contain a good deal of gossip regarding the Revolution.

The Zurich Letters. Translated and edited for the Parker Society, by the Rev. H. Robinson, D.D. A third volume of Letters may as well be disposed of at once.

When Bishop Burnet passed through Zurich, in 1685, he saw among the archives of the Dean and Chapter, a vast collection of letters written either to Bullinger or by him, which filled several folio volumes, and, being written by many distinguished Protestant exiles, who had been banished from England during Mary's reign, and returned on the accession of Elizabeth, they were naturally supposed by Burnet to contain "a great many particulars relating to the history of the Reformation." He and Strype have already published a few of these letters, but the collection is now for the first time given to the public.

The custom of the age required that the correspondence of these grave ecclesiastics should be conducted in Latin, but the feeling which pervades every one of their letters is thoroughly English; we refer to the hearty good will which the writers bear to their correspondents, and the plain and undissembled manner in which they express their feelings towards enemies. Without trenching on the province of the theologian, we may be permitted to express our regret at the evidence before us, that men who could make all allowance for the many failings of their friends, could not see anything but unmixed evil in their opponents. It is but too evident that much of the fire which burnt in the bosoms of these zealous men, was derived from other sources than that sacred temple, for the purification of which they so earnestly contended. No language of love and reverence seems to them too strong when writing to their friends, as for instance—"Farewell, my father, my pride, and even the half of my soul." "Hail! again and again, most illustrious and very dear Gesner." "It would give me the greatest pleasure to see even a dog from Zurich." And Jewel says to Peter Martyr:—

"Though, whenever I think about you (as I certainly do every hour of my life, and should be very ungrateful if I did not,) I am delighted at the very thought and remembrance of your name; yet when I read your letters, I seem to myself to be at Zurich, and in your society, and in most delightful conversation with you, which indeed, believe me, I value more than all the wealth of the bishops."

But when theological adversaries come in the way, they receive but little mercy:—

"As to your expressing your hopes that our bishops will be consecrated without any superstitious and offensive ceremonies, you mean, I suppose, without oil, without the chrism, without the tonsure. And you are not mistaken; for the sink would indeed have been emptied to no purpose, if we had suffered those dregs to settle at the bottom. Those oily, shaven, portly hypocrites, we have sent back to Rome from whence we first imported them. * *

"We found at the beginning of the reign of Elizabeth, a large and inauspicious crop of Arians, Anabaptists, and other pests, which I know not how, but as mushrooms spring up in the night and in darkness, so these sprung up in that darkness and unhappy night of the Marian times."

Parkhurst, lamenting the "skirmishes and contentions among the reformers," adds, "May the Lord grant an end (*finem*) to these things, and a halter (*funem*) to the Papists."

No one can peruse these Letters without collecting from them numerous instances tending to prove that the physical condition of society has wonderfully improved since those times. What would an English traveller now think of a journey of fifty-seven days to Zurich? Jewel says—

"So wretchedly were we delayed by the badness of the roads, that it was with some difficulty that, on the fifth day after, we arrived at Strasburgh.—We have not yet heard what Sandys, Horn, and our other friends have been doing in England. Nor indeed is it to be wondered at; for, having left Strasburgh on the 21st of December, they would hardly be able to reach Antwerp in twenty days after, because the Rhine being frozen over would prevent their travelling by water."

In this railroad era it is almost impossible for us to understand Jewel when he says, writing from London, "The Queen is now a *long way* off in Kent," or Parkhurst, when he speaks of the great distance of Norwich from London. The volume abounds with complaints of the delay and risk connected with the transmission of letters. Jewel, for instance, thus exculpates himself from the charge of "forgetfulness or dilatoriness:"—

"I have indeed written to you *three* letters since

Digitized by Google

my return to England; which I perceive, however, had not reached you at the time you wrote. And it may be, as is often the case, that they are either loitering somewhere or other, and are, like religion among ourselves, reposing in listless inactivity, or else have been lost on the road."

But "letters" were not the only proofs of good will and affectionate remembrance which these brethren in exile sent to each other. The comparative penury to which many of them were subjected, rendered very acceptable to the receiver the small donations which were transmitted by those who had to say with Jewel, "As yet not the slightest provision has been made for any of us, so that I have not as yet abandoned the device which I designed for myself at Zurich, a book and a cross;" or, "as yet nothing more has been imposed upon me than the name of Bishop." "From our country there went a few ells of broad cloth to make your reverence a gown," or "a few Italian crowns," and from Zurich there came back in return the most welcome present of a new polemic treatise, which would "cut the foe down to his saddle-tree." Foxe sends "some beer" to his friend Henry Bullinger, which present went from Basle, where the martyrologist sojourned, to Zurich.

Let it not, however, be supposed that the 'Letters' are entirely taken up with trifles such as these. The Tigurine Epistles carefully record those events which have so powerfully influenced the destinies of succeeding ages; they are full of all kinds of polemic matter; they touch upon court intrigues, duly recording the movements of "the Queen, a most discreet and excellent woman;" they detail the gradual decline and downfall of the adherents of Mary, as Bonner, Feckenham, Pate, Story, Cole, and Watson; they give the objections of the Puritans, "who would have the church purged from all the dregs of Popery;" in a word, they leave unnoticed very few of the great political and religious facts of English history from 1558 to 1590.

In the extracts which we have yet to give, we shall leave the trodden highways of history, and indulge ourselves in a ramble along a few of its less frequented paths.

We have in these letters many examples of the superstitious feeling of the age. Jewel writes to Peter Martyr thus:—

"On the 7th of May the great spire of my cathedral at Salisbury was, not merely struck, but so shattered by lightning, that a continued fissure was made from the top for sixty feet downwards: consider whether there is anything ominous in this circumstance. It so happened that I had not yet arrived there: had I done so, so foolish and superstitious are men's minds, that all this mischief would have been ascribed to my coming. I shall, however, go thither to-morrow, and put my hand to the plough."

And Bishop Parkhurst authenticates the following tale:—

"A certain young Dutch woman about seventeen or eighteen years of age, a servant of the preacher of the church at Norwich, was, during a whole year, miserably vexed by Satan. In all her temptations, however, and dilacerations, she continued stedfast in the faith, and withstood the adversary with more than manly fortitude. At last, by God's help, the devil being overcome left her, and almost at the same instant attacked the son of a certain senator, whom he also tormented in a most incredible manner for some weeks together. Public prayers were offered in the city by my direction, and a fast proclaimed until evening. The Lord had mercy also on the boy, and overcame the enemy. The boy was thirteen or at most fourteen years old, and, for his age, well versed in the scriptures, which, stedfast in faith, he boldly launched forth against the enemy. The Lord liveth, by whom this boy and girl, of a weak constitution in other respects, were enabled to overcome so great and terrible an adversary."

Again, Jewel records the observations on the marvellous effects of a bad season:—

"There has been here, throughout the whole of the present year, an incredibly bad season both as to the weather and state of the atmosphere. Neither sun, nor moon, nor winter, nor spring, nor summer, nor autumn, have performed their appropriate offices. It has rained so abundantly, and almost without intermission, as if the heavens could hardly do anything else. Out of this contagion monstrous births have taken place; infants with hideously deformed bodies, some being quite without heads, some with heads belonging to other creatures; some born without arms, legs, or shin-bones; some were mere skeletons, entirely without flesh, just as the image of death is generally represented. Similar births have been produced in abundance from swine, mares, cows, and domestic fowls. The harvest is now coming on, rather scanty indeed, but yet so as we have not much to complain of."

The notices given of individuals who were either friends or foes of the Reformers, are often curious; and, frequently, the career of a particular person may be traced through several letters. An unhappy illustration is the case of Richard Smith, Regius Professor of Divinity at Oxford, who wrote in favour of the Celibacy of Priests. We have him first in the 4th letter:—.

"Your renowned [antagonist] Smith, the patron of chastity, has been taken in adultery, and on that account is ordered to retire from the theological chair, by a new practice, and without a precedent, as the like was never done in Mary's time."

Then in the 19th:—

"But your friend Smith, what has he done? you will ask. Can any good thing come out of Nazareth? Believe me, that he might retain his old consistency, he has now at last recanted for the fifth time! The silly man, when he saw religion change, changed his habit, and forthwith prepared to take refuge in Scotland; but while he was loitering on the borders, he was apprehended, and brought back from his travels. And now this grave personage, this prop and support of religion, has come over to us, deserted all his party, and become all of a sudden the most inveterate enemy of the papists. Go now and deny transubstantiation, if you can."

And last of all in the 34th:—

"Smith has gone into Wales, where, they say, he has taken a wife, with the view, I suppose, of refuting all your arguments. However this may be, he boasts of his grey hairs and empty head. He now keeps a victualling house, and gains his livelihood by a hired tavern, despised by our friends and his own; by those who know him, and those who do not; by old and young, by himself, by every one."

Among the most curious parts of these letters are to be classed the many expressions from the pen even of the Bishops, which show how uneasy all parties were, and how incomplete in their minds was the religious change that had been effected. Elizabeth was considered only half a Protestant by many of them, and "the Queen's little silver cross" forms a great stumbling block to those who thought that every vestige of Popish practice and ceremonial should be swept away.

The following extract from a letter written by the great apologist of the Church of England, John Jewel, to a no less celebrated man, Peter Martyr, shows how anxious and feverish the minds of the Reformers continued to be, even under the powerful Protestant Queen:—

"Religion among us is in the same state which I have often described to you before. The doctrine is everywhere most pure; but as to ceremonies and maskings, there is a little too much foolery. That little silver cross, of ill-omened origin, still maintains its place in the queen's chapel. Wretched me! this thing will soon be drawn into a precedent. There was at one time some hope of its being removed; and we all of us diligently exerted ourselves, and still continue to do, that it might be so. But as far as I can perceive, it is now a hopeless case. Such is the obstinacy of some minds. There seems to be far too much prudence, too much mystery, in the management of these affairs; and God alone only knows what will be the issue. The slow-paced horses retard the chariot. Cecil favours our cause most ardently. The bishops are as yet only marked out [for promotion], and their estates are in the meantime gloriously swelling the exchequer. Both our universities, and that especially which you heretofore cultivated with so much learning and success, are now lying in a most wretched state of disorder, without piety, without religion, without a teacher, without any hope of revival."

Again, the same writer says—

"The scenic apparatus of divine worship is now under agitation; and those very things which you and I have so often laughed at are now seriously and solemnly entertained by certain persons, (for *we* are not consulted,) as if the christian religion could not exist without something tawdry. Our minds indeed are not sufficiently disengaged to make these fooleries of much importance. Others are seeking after a *golden*, or, as it rather seems to me, a *leaden* mediocrity; and are crying out, that the half is better than the whole."

Of all the moderate party of the Reformers, the Apologist speaks the plainest. He evidently distrusted the Queen. "The Queen," he writes to Peter Martyr, "declines being styled the head of the church, at which I certainly am not much displeased;" "but," says Bishop Parkhurst, writing to Bullinger, "she willingly accepts the title of governor, which amounts to the same thing."

The feeling with respect to the retaining any of the vestments worn by the Papists, is well expressed in a letter from Thomas Lever to Bullinger, in which he gives a melancholy picture of the paucity and ignorance of the clergy at that time (1560):—

"In the injunctions, however, published by the queen, after the parliament, there are prescribed to the clergy some ornaments, such as the mass-priests formerly had and still retain. A great number of the clergy, all of whom had heretofore laid them aside, are now resuming similar habits, and wear them, as they say, for the sake of obedience. There are indeed but few of us, who hold such garments in the same abhorrence, as the soldier mentioned by Tertullian did the crown. But we are not ignorant what occasion the papists will take from thence, as a cause of stumbling to the weak. For the prebendaries in the cathedrals, and the parish priests in the other churches, retaining the outward habits and inward feeling of popery, so fascinate the ears and eyes of the multitude, that they are unable to believe but that either the popish doctrine is still retained, or at least that it will shortly be restored. Many of our parishes have no clergyman, and some dioceses are without a bishop. And out of that very small number who administer the sacraments throughout this great country, there is hardly one in a hundred who is both able and willing to preach the word of God; but all persons are obliged to read only what is prescribed in the books. Thus indeed is the Lord's harvest very abundant among us, but the labourers are very few."

Our readers may not be unwilling to hear Bishop Jewel's opinion on a contest which has been revived in our own times. We allude to the use of the surplice in church ministrations:

"The contest respecting the linen surplice, about which I doubt not but you have heard either from our friend Abel or Parkhurst, is not yet at rest. That matter still somewhat disturbs weak minds. And I wish that all, even the slightest vestiges of popery might be removed from our churches, and above all from our minds. But the queen at this time is unable to endure the least alteration in matters of religion."

Another mooted point of the present times, the use of candles on the altar, was debated, it seems, at the time of the Reformation. Bishop Parkhurst writes thus to Bullinger:—

"I wrote you word that the cross, wax candles, and candlesticks had been removed from the Queen's Chapel; but they were shortly after brought back again to the great grief of the godly. The candles heretofore were lighted every day, but now not at all. The lukewarmness of some persons very much retards the progress of the gospel."

Digitized by Google

There are a few notices of Mary Queen of Scots, who, as a Catholic, was feared and hated by the Reformers. Bishop Jewel thus speaks of her:—

"The Queen of Scots, an exile from her country, is, as you know, here in custody; with sufficient honour indeed, yet so as that she cannot raise any disturbances. This is she to whom Pope Pius not only freely promises Scotland, but England likewise; for he hopes that a woman, a catholic, a murderer of her husband, and an adulteress, will have great influence in the restoration of popery!"

Bishop Parkhurst gives the following account to Bullinger of the murder of David Rizzio and the birth of James the First:—

"In the month of March an Italian, called Signor David [Rizzio], skilled in necromancy, and in great favour with the queen of Scots, was forcibly dragged out of her chamber in her presence, and died wretchedly pierced by many stabs. A certain abbot was wounded at the same place, and escaped with difficulty, but died of his wounds shortly after. A monk named Black, a Dominican friar, and a chief man among the papists, was killed in the court at the same time.

Seized by black death, this blacker knave
Descended to the gloomy grave.

The lords of the council, who were then assembled in one chamber, to consult about some matters of importance, when they heard of these massacres, (for they had no previous suspicion of anything of the kind,) quickly betook themselves to flight, some one way, some another; some threw themselves out of the windows at the risk of their lives, and thus escaped. The queen of Scots has brought forth a prince; and whereas heretofore she had no great regard for her husband, I know not for what reason, she is now on the best of terms with him. She has lately received into favour the lord James, her brother, by the father's side, whom she formerly detested; and not only him, but, as I hear, all the evangelical leaders. I wish it may be true. The gospel, which was lulled to sleep for a time, is again raising its head. While I was writing the above, a certain Scottish refugee, a good and learned man, has informed me, that the queen was brought to bed ten weeks since, but that the child is not yet baptized. On my asking him the reason, he replied, that the queen will have her son baptized in the high church, and that many masses are to be celebrated. But the people of Edinburgh will not allow this: for they would rather die than suffer the detested mass to insinuate itself again into their churches. They are afraid however of her calling over auxiliary troops from France, that she may more easily overwhelm the gospellers. Let us entreat God for our pious brethren. She ordered some pious nobleman to turn Knox, who was residing with him, out of his house. May the Lord either convert or confound her!"

With this we must conclude. The value of this edition is increased by its being furnished with a good Index of proper names.

REPEAL SONGS OF MUNSTER.

Songs, Ballads, and Skellig Lists. Cork, Hely.
The Spirit of the Nation. Dublin, Duffy.

SEVEN years have elapsed [*Ath.* No. 472] since we introduced the Munster Melodies to our readers as specimens of "a new school of poetry, a new system of civilization, an original code of laws, and a language so purely native that it has not yet submitted to the fetters of grammar." The Munster Muses have not been idle during this interval, but unfortunately they have changed the character of their strains; they have become controversialists and politicians, staunch advocates of Romanism and Repeal, claimants to the gift of prophecy, and not unfrequently garnishing their predictions with bits of personal satire. There are those who attribute this change to the influence of the Kildare Street Society's schools: they tell us that the Catholic scholars being compelled to conform so far to Protestant rule as to read the Scriptures daily, regarded this requisition as a tax imposed upon education, a badge of inferiority maintained in the spirit of ascendancy, and a mode of effecting that proselytism which the Society publicly disavowed; and that bitterness and personality first began to manifest themselves in the Munster Melodies just as the generation trained in the Kildare Street schools began to take an active part on the busy stage of life; and certain it is that ballad-controversy has largely increased wherever attempts have been made to set aside the national system of education in order to establish schools on more exclusive principles. A new generation, trained chiefly in the national schools, is just beginning to appear in public life; its most striking peculiarity is, that it is more purely English in language and habits of thought than the Anglo-Irish themselves. In localities where nothing but Gaelic was spoken some years ago, it is now exceedingly rare to find any one between the ages of twelve and twenty-five who does not speak English, and who does not use that language in preference, because it is the language in which he has learned to think. Even in remote rural districts, it is commonly said that Irish has become as rare as English was some twenty years ago. The change in this respect is confirmed by the testimony of the ballad-venders; they say that there is now scarcely any sale for the ballads written in native Irish, and exhibit the assortments which they furnish to itinerant retailers for fairs and markets, in proof that the English language is fast establishing itself in every part of the country.

The little work which we have named at the head of this article appears a very fair exponent of the literary taste of the generation entering upon life, while the Repeal songs and controversial ballads of the broad sheet, form at least as accurate an index to the taste of the generation by which the busy stage is at present occupied. Thus viewed, the contrast between them appears striking. We say nothing respecting the political or religious character of these songs, but looking merely to their moral and intellectual bearing, it is impossible not to see that the older ballads exhibit a vagueness of idea, and recklessness of expression, that characterize men wanting something, but not exactly knowing what, while the songs of *The Nation*, which are universally popular with the youth of Ireland, and indeed almost exclusively the poetry read by all between the ages of sixteen and twenty, display an earnestness and vehemence, with occasional bursts of fiery energy, which could only result from fixed and determinate resolution.

The first ballad to which we shall direct attention includes a prophecy which is to have its fulfilment in the present year, and is entitled 'The Distressed Maid of Erin!' Its style belongs to the old school of Munster Melodies, when candidates for the office of hedge-schoolmaster were compelled to recite some ballad of their own composition as a proof of their qualifications. On these occasions it was their custom to use words "of learned length and thundering sound," with very little attention to their meaning or appropriateness, and to adorn the verse with classical allusions of the most recondite nature, so as to amaze the rustics with the profundity of their learning. O'Healy, the author of the following song, is one of the last survivors of this school; he unites in his person the qualifications of mathematical teacher, village bard, and land-surveyor:—

You Nine sublime, receive my petition,
Pity my condition, and raise my ambition
With a few scrolls those lines to compose,
So I now ardently implore your assistance,
To inspire me with a flow of eloquence,
All in consequence of a droll song I mean to compose,
Touching and tracing a fair maid's brilliancy,
Who interrogated the state of my country,
And that has bewilderod my dreams incessantly,
Lulled on a couch in sweet repose.

This immaculate creature had sure astonished me,
Embower'd by God's decree beneath an aspen tree,
On a seat sedate, in majestic state,
The mother of Cupid I thought her to be;
But she soon attracted me up to vanity,
And in a strange heat my heart did beat;
Had I by leases the places of residence
Of Lord Doneraile or Hely Hutchinson,
I'd sell them by mortgage and all by articles,
To chase a hare on her golden estate.

Could I but cope with Homer's eloquence,
To each distant settlement, fearing no detriment,
Her mode in prose I'd quickly transpose;
Then Hector and Jason would fawn on her personage,
So would Achilles vie with Hercules,
In rowing ashore my love to export;
Those champions would fight with great animosity,
The bravest by right to enjoy her majesty,
The valleys with harmony echoing equally,
Each home stroke with a sounding report.

This prolific dale I ranged for curiosity,
With civil authority and kind urbanity,
Saying hail! my wandering maid,
And suffer'd no great delay in perplexity,
But now her dexterity cheats my fidelity,
Her native state, profession and trade;
Are you the Parnassian part of the family,
Who through ancient wars exchanged her lenity,
And caused such calamity drowned in eternity,
By her regression of aid in Babylon's shade?

Or are you the lightsome Dido or Proserpine,
Or the Queen who voluntarily did accompany
And was decoyed by Paris to Troy,
And left many a list to muster her energy,
Deranged by jealousy in pausing soliloquy,
Trying once more his rights to enjoy?
If you be a sporting roving frolicker,
From Paphos' grove, for the use of foreigners,
With kind hospitality and officious philanthropy
I'll supply you with blisses of joy.

Bless me, O'Healy, your tedious inquisition,
In a composition, would pierce the disposition
Of the wild and wise of the feminine kind,
It makes me deny to be Dido or Proserpine,
Or the Grecian consort, who most unfortunately
Despised and left her husband behind;
In the annals of fame my name is inserted free,
Tho' big-belly'd bears had thought to convert me,
For James had neglected, and William subjected me
Alongside the Boyne, where I was confined.

Indeed, sir, I'm a maid that's weak and languid,
A sighing young damsel that's teased by fanatics,
My bones are broke—I'm tormented full sore;
The year twenty-nine had partly vanquished;
The doings of Calvin were then examined,
And be it known from the post of sweet Donoughmore
That the year forty-three will relieve all our agony,
As Saint John the Divine has divined in his prophecy,
From that year out, no more animosity—
And so forth—there's an end to my scroll.

Another prophetical song is entitled 'A Dialogue with the Ruins of an Old Monastery.' It is not destitute of literary merit; though the rhymes are frequently rugged and imperfect, there is an harmonious flow in the run of the verse. Some of the sentiments are borrowed from Ward's Hudibrastic History of the Reformation, of which several cheap editions have been published in Dublin, and have proved very good speculations.

In the year twenty-four I took a short tour
On the beautiful shore of Old Erin,
To view her dear plains and her clear winding streams,
Which Providence framed so ensnaring;
The nightingale nice with his harmonious voice,
Made Nature rejoice in each station:
This enchanting scene on our island so green
Made me surely esteem Paddy's nation.

For a churchyard was near, then my course I did steer
Where a few silent tears I vented;
To see the sad state of those buildings so great,
Their awful defeat I lamented.
When I thought on that clan that invaded our land,
Whose impious hands caused vexation,
And strove by all means like the cursed ancient Danes
To gall the true remains of our nation.

Quite silent I mused, my mind being confused,
To behold the abused holy temple,
All wrecked and defaced by a profligate race,
That on virtue and grace long have trampled;
My heart it did bleed on beholding the weeds
Spring up where good deeds once were stationed,
And the ivy, alas, all hung round where the Mass
Had been read to each class in our nation.

Said I, noble pile, then who did you defile?
Or why are you spoiled or deformed?
Or what wicked crime have you done in your time,
That here you're declined, mocked and scorned?
Now answer me sure, have you been impure,
Or loaded the poor with taxation,
Or tore life or land from the creature called man,
Thus bewildered to stand in our nation?

In low solemn strains spoke the holy remains,
With language quite plain and sincere then,
Now since it is so that you would wish to know,
The cause of my woe, I'll declare then:

Digitized by Google

A licentious knave, that is now in his grave,
Old Harry, a slave to temptation,
My altars profaned and my ornaments gleaned,
And my clergymen slain thro' the nation.

But tell me, I pray, what caused him to stray,
That once did obey and respect you?
Was he not your friend, and your faith defend,
When Luther, the fiend, did reject you?
He stood for your cause, your maxims and laws,
Which gained him applause in his station.
Can it be the case that he acted so base,
For to bring such disgrace on the nation?

Kind sir, it appears, that when he lived near
To twenty long years with his wife, sir,
He got quite enchanted with a comely young dame,
Which was the sole means of his strife, sir;
To Rome he applied but his suit being denied,
He then stepped aside from salvation,
And barbarously slew every person he knew,
That to popery was true in the nation.

Your words strike a dart thro' my poor sinful heart,
Which makes me to smart in great torment,
Because that each man did'nt rise thro' the land,
For no human hand should lie dormant,
But all gather round this domestic clown,
And straight pull him down with impatience,
That left you forlorn, all split, wrecked and torn,
That once did adorn our nation.

My dear worthy sir, to attempt for to stir,
Would only incur the displeasure
Of our Saviour dear, who was mocked, scoffed and jeered,
And flogged most severe beyond measure;
When nailed to a cross without any remorse,
By merely the dross of creation,
His Father he called for to pardon their fall,
A lesson for all through each nation.

That structure then said, My friend, don't be dismay'd,
The church that Christ made will reign victor,
Hell's gates can't prevail, tho' they do her assail,
Pursue well my tale in the scripture.
St. Matthew explore the 6th chapter o'er,
The 18th verse in its station,
Will prove that she'll shine to the last day of time,
Both pure and divine thro' the nation.

Another specimen of prophetic controversy is an imaginary dialogue between a handsome new Roman Catholic chapel, now in progress of erection, and its neighbour, old Shandon church. This chapel is one of the lions of Cork; it was projected by Father Mathew, and all the subscriptions were collected by his individual exertions:—

A Discussion between a Church and a Chapel.

One morning early, as day was breaking,
Being in the charming sweet month of May,
When Flora's mantle had decorated
The fragrant plains all in rich array;
The lofty mountains I could survey them,
The purling streams and the river clear—
The crystal fountains and billows rolling,
Where ships were sailing from far and near.

I being reconciled with the sweets of nature,
I was preparing to take my way,
Till overhearing a conversation,
A while occasioned me to stay:
Being a discussion in that place had taken,
Between new neighbours, near to Cork town,
About the chapel founded by Father Mathew;
But Shandon Church it began to frown.

This Church it broke out from its silence,
And in great violence to the Chapel said,
What spark are you that stand behind me?
My friends and neighbours you have betrayed,
My predecessors you did inveigle,
To renegade from their native home,
Where my ancestors are clad in earth,
And are still remaining 'till the day of doom.

The prudent Chapel soon made answer,
And was not angry, nor yet confused:
Madame, sitting in your pomp and grandeur,
I beg the favour to be excused;
Tho' here I 'm standing both poor and naked,
I do inveigle nor flatter none—
I was erected by true Milesians—
My ordination is the Church of Rome.

Don't you remember, in former ages,
When you were naked as well as me?
Till by Church cess you did invade us,
Oppressing creatures with tyranny;
The tithes and taxes that you were craving,
We freely give you, tho' not your due;
They did belong to the Priests and Jesuits,
Whose ordination from Christ was true.

The holy Temple that began by David,
Was bare and naked awhile, like me,
Till by King Solomon it was supported,
A house of prayer and great dignity:
It was Christ began my first foundation,
To the end of days I will firm stand,
And with open arms I will receive
All Adam's race with the cross in hand.

The holy Scripture it clearly shows us,
The wicked forces of heresy
By King Pharaoh were then supported,
To the law of Moses would not agree,
Till with a plague they were afflicted,
With snakes and serpents throughout the land;
The Israelites they were pursuing,
The sea consumed them by God's command.

The tithes and taxes will be defeated,
And the Proctor's race will soon stand still;
The three hundred years the Serpent gave them,
Are clearly traced now by Columbkill;
When you are a shelter for owls and ravens
To perforate and reduce your walls,
Then I will flourish each morning gaily,
With joy-bells echoing, my flocks to call.

The first beginning of this new Chapel,
Was in eighteen hundred and thirty-three;
It will soon be finished by the subscribers,
And all those tyrants then must flee;
There pious Christians will flock in numbers,
To heal their souls at this blessed ground,
To have the benefit of the Christian prayers,
Till the Judgment day, when the trumpets sound.

To bring those verses to a conclusion,
I won't intrude on the Muses nine:
Good Christians all that now peruse them,
I hope you'll excuse my stupid mind.
One request I am earnest craving,
The fervent prayers of both old and young,
For my assistance to gain salvation,
And all true members of the Church of Rome.

Turning from the controversial to the purely political songs, we find it no easy matter to select the most illustrative from the pile before us. Perhaps, after all, popularity is the safest guide; and we shall give precedence to that which has gone through an unparalleled number of editions, during the few months that have elapsed since its publication.

Erin go Bragh.

Air—'Exile of Erin.'

Once more pray assist me, ye bards of those ages
Who stroll round Parnassus and thirst for renown;
Assist me, ye Muses, ye Graces, and sages,
In those simple verses I'm going to pen down.
Then, then to the subject, to me so endearing,
I fling forth my weak simple talents and a',
In praise of my country, my green mantled Erin,
The land of O'Connell, sweet Erin go bragh.

O! Erin, my country, thou land of great splendour,
The relics of greatness are seen through thy plains,
O witness the ruins of thy buildings and grandeur,
And think on the time great Brian beat the Danes.
Yes, yes, thou'rt the land of Burke, Sheridan, and Grattan,
Great Sarsfield, Moore, Curran, and Mathew, agra,
And holy Saint Patrick, whose name is so pat in
The hearts of the offspring of Erin go bragh.

Then, why should we be dragg'd thro' each mire and channel,
By proud haughty Britain—have we no resource?
Yes, yes, we've our leader, immortal O'Connell,
And to none we're inferior in physical force;
A teetotaller's a man that was ne'er beat in battle,
He could handle the gun, and the sword he could draw,
And tho' bullets should whistle, and cannons should rattle,
He'd be true to the cause of old Erin go bragh.

Tho' the Tories of England with vile names may taunt us,
And call us a rabble, and our priests ruffians vile,
Yet the time it will come when they surely will want us,
And then they must give us our own little isle.
For in spite of John Bull, then fair Freedom's unfurl'd,
We're backed by our friends, tho' they're far awa';
And the theme of the freemen, all over the world—
O'Connell, Repeal, and sweet Erin go Bragh.

Then rouse you, Milesians, arouse from your slumber,
And lash to the helm the ranks of Repeal;
Arouse you, Teetotallers, six millions in number,
Since liberty's wafted along on the gale.
Oh! where is the Irishman who'd be unwilling,
When to him the famed Repeal warden should ca'
To spare for his country one small annual shilling,
To carry Repeal for sweet Erin go bragh?

So now, as I mean to make a conclusion,
Long life and success to our virtuous Queen;
May her reign be in peace, without any confusion,
For she's well disposed towards the island of green.
Put an end to all strife, and away with disunion,
And let all your actions be inside the law,
And let your watch-word be Repeal of the Union,
O'Connell, brave Grattan, and Erin go bragh.

Another song, to the popular air of Ballinamona Oro, takes up the cause of the dismissed magistrates, in the following strain:—

Honour and glory to you, my Lord Ffrench,
On the Irish woolsack will soon be your bench,
Then a fig for that despot—a disgrace to the wig;
O his name it would shame poor Nell Flaherty's pig.
Singing Ballinamona Oro,
Ballinamona Oro,
Ballinamona Oro,
Repeal and O'Connell for me.

There's another old wizard, he is playing a trick;
Too proud to resign, so poor fellow took sick;
Such intricate jokers the world never saw:
They disappointed poor Roden, and they bother'd poor Shaw.
Singing, &c.

Now for Booby Bernard, a rogue or a fool,
From the hot-bed of faction—the old Brandon School—
He was like one overtaken by thunder and hail,
When trumpet-tongued Bandon it shouted Repeal.
Singing, &c.

The poor bard concludes with an allusion to the mishap of one of his brethren, and at the same time assigns a curious cause of confidence in his own escape from similar misfortune:—

O yet, with all our vaunting, 'tis strange for to tell,
A ballad-singer last week was confined in Clonmel;
But my song I will sing, and I fear no fellow's frown,
We have now Repeal Lawyers in every town.
Singing, &c.

Every repeal demonstration and monster meeting has been duly chronicled in song; that of Tara Hill has been the most celebrated, as might have been expected, from the associations of the locality with the history of Ireland, previous to the Anglo-Norman invasion. The following is the best of the score devoted to celebrating this display:—

Draw near, you Irish hearts of oak,
You brave old Tara heroes,
The chain that binds us must be broke,
In spite of all those Neroes.
O'Connell gives you great applause
Throughout this Irish nation;
You're foremost in Hibernia's cause,
In quest of liberation.

CHORUS.

Hurra for Dan and noble Steel,
The pride of Erin's nation:
In spite of Wellington or Peel,
We'll gain our liberation.

On Tara's hill, the other day,
Five hundred thousand did assemble;
Teetotallers did sweetly play,
Our foes for to make tremble;
The roads were neatly arched with green,
Our flags hoisted in rotation,
Three cheers were given for the Queen,
And four for liberation.

When gallant Dan to Tara came,
Our boys did bravely cheer him,
He roused the hearts of old and young,
That assembled there to hear him.
He'll surely free us from the yoke,
If our aid we freely lend him;
You would think it was an angel spoke,
For the Clergy did attend him.

Think on the words of noble Steel,
Of the Protestant communion;
To our enemies he'll never yield,
Until we repeal the Union.
He tells us if we all unite,
In spite of all alarms,
We'll surely gain the glorious fight,
Without the force of arms.

Kilkenny, Cork, and Limerick too,
Call for the rights of Granua;
Tipperary showed what they could do,
In Cashel and in Nenagh:
Five hundred thousand on the plains,
Demanding liberation.
Not half that number swept the Danes
Far from our Irish nation.

God bless our Queen—long may she reign;
What foe dare to offend her?
Granua's sons with swords and guns
Are ready to defend her;
Long live each man that joins with Dan—
No matter what communion;
But in spite of all the Tory clan,
He will repeal the Union.

Passing over the songs recording O'Connell's progresses, though sorely tempted to quote that which describes his triumphal entry into Cork, we turn to one of a different character, which is not less popular within the sound of the bells of Bow, than it is amongst those who listen to the bells of Shandon:—

The Poor Irish Stranger in London.

O pity the fate of a poor Irish stranger,
That wandered thus far from his home,
I sigh for protection from want, woe, and danger,
But I know not which way for to roam;
I ne'or shall return to Hibernia's green bowers,
Where tyranny has trampled the sweetest of flowers;
They gave comfort to me in my loneliest hours,
But they are gone—I shall ne'er see them more.

With wonder I gazed on the high lofty mountain,
As in grandeur it rose from its lord,
And with sorrow beheld my own garden yielding
The choicest of fruits for its board;
But where is my father's low cottage of clay,
Where I've spent many a long happy day,
Alas! has his lordship contrived it away?
Yes, 'tis gone—I shall ne'er see it more.

When the sloe and the berry hung ripe on the bushes,
I have gathered them off without harm,
And I've gone to the fields where I've shorn the green rushes,
Preparing for winter's cold storm;
I have sat by the fire of a cold winter's night,
Along with my friends, telling tales of delight;
Those days gave me pleasure, and I could invite—
But they're gone—I shall ne'er see them more.

O Erin, sad Erin, it grieves me to ponder
The wrongs of thy injured isle;
Thy sons, many thousands, deploring do wander
On shores far away, in exile.
But give me the power to cross over the main,
America might yield me some shelter from pain,
I'm only lamenting while here I remain,
For the joys I shall never see more.

Farewell then to Erin, and all those left weeping
Upon thy disconsolate shore;
Farewell to the grave where my father lies sleeping,
That ground I will ever adore.
Farewell to each pleasure—I once had a home,
Farewell—now a stranger in England I roam;
Oh give me my freedom, or give me my tomb,
Yes, in pity—I'll ask for no more.

The world has borne testimony to the wisdom of the statesman who preferred the power of making a nation's ballads to that of making a nation's laws; we have given specimens of the ballads which, from their extensive circulation, appear to be the exponents of popular feeling in the south of Ireland. From the way in which most of them refer to the repeal of the Union, it appears that they have no very definite idea of the real nature and effects of such a measure; they seem to regard it as a mysterious something by which their grievances will be redressed, and the elements of prosperity in the country developed for the benefit of its inhabitants. This is sufficiently manifest in the following stanzas:

We have noble members to stand to our cause,
To obtain for Granua her just rights and laws;
Keep sober and steady, and then I go bail
That Dan gets for Ireland a speedy Repeal.

That trade it may flourish in Ireland once more,
We'll have peace and plenty as we had before;
Each man for his labour well paid he must be,
So we'll live in contentment in Erin ma chree.

From these ballads it is also evident that the cry of Repeal has been taken up, not so much for its own sake as because it has been recommended by the leader; praises of O'Connell are more numerous and more hearty than aspirations for Repeal. To such an extent is vagueness of object combined with strong personal attachment to the leader, that in one song the highest praise given to the Goddess of Freedom is that "she is like O'Connell's daughter;" and in another the popular demands are said to consist of "the rights he showed we wanted." It deserves to be further remarked, that many of the old symbolic songs in which the Jacobites of the last century professed their secret allegiance to the Pretender have been modernized and applied to O'Connell. He figures as "the blackbird"—"the green linnet"—"the white horse"—"Daniel in the lion's den"—"Moses"—"the hope of Erin"—and, whimsically enough, as "the grey mare," an animal said to have been ridden very roughly by successive generations, but which is now on the point of throwing its rider. The promised publication of the Jacobite relics of Ireland will probably afford us an opportunity of showing how the same symbols have been applied to different leaders of opposition or revolt for three centuries; but at present we shall quote only one symbolic ballad, in which O'Connell appears as the White Rose of Tara's bower. It may be interesting to remark, that the Irish, in the wars of the Roses, were zealous supporters of the House of York, and that the white rose has been the favourite cognizance of Irish insurgents ever since the days of Lambert Simnel and Perkin Warbeck.

You true sons of Erin, be faithful and steady,
And to your Queen most royal be loyal and ready,
To come to the bower with full powers just and legal;
It was on Mount St. Jean where we cleared off the eagle.

Chorus.

Will you, will you, will you, will you
Come to the bower?

Will you come to the bower, where my flower I have planted?
For Cork County he's elected, with courage most undaunted.
I will show a sight most delightful and pleasing,
Unto all honest hearts of every persuasion.

Will you come to the bower, where my flower it is blooming,
And a most stately air of late is assuming?
It blooms in Merion-square, and a native is of Kerry,
It is esteemed at Kildare and at Wexford Ferry.

Will you come to the bower, where my flower it blooms daily,
With a shamrock so green, and a sprig of shillelagh?
All over Paddy's land its branches are extending,
Though under state squalls and storms it was bending.

Will you come to the bower, towards royal Tamar,
Where we planted our rights in spite of each defamer?
Around Tara's Hall we will call our fine heroes,
The true sons of O'Neill and the brave Glanville heroes.

Will you come to the bower, where my flower is in blossom?
And Lord Sarsfield of old he wore it in his bosom.
By a blast from the Hague it lay fading and dying,
But now with the White Rose once more is reviving.

Will you come to the bower, and my flower's name I'll tell it?
With a D. and an O'C. most nobly you can spell it.
I'll send it in a barge over St. George's deep channel,
It is blooming in the house—my flower is O'Connell.

Will you come to the bower, where my flower will take root in?
And the harp it shall play to the air of Lord Lucan;
Our Queen is of the race of old famed Caledonia,
But Daniel is our jewel, and a true Anemona.

When seated in the bower, if Peel, Wellington, or others
Dare to oppose him, we will go off like brothers;
And on Mount St. Jean once more pluck the lily,
As we now have obtained what we lost by Orange Billy.

Chorus.

The specimens we have extracted, sufficiently illustrate the character of the Repeal Songs of the older school; the lyrics of the New Academy must next claim our attention, and they are sufficiently important to require an article for themselves.

Letters from New York. By Maria Child. Bentley.

HERE we have a tempting title-page and a pleasant Table of Contents, but the book itself is a disappointment. It reminds us of the game that children play at, called "Cherry-bob,"—you shut your eyes and open your mouth, and get nothing. Here you start with a new chapter and a pleasant paragraph, which, in the spirit of the title-page, promises some local information of interest, and lo! when you are all gaping for it, the lady fobbs off upon you a rigmarole piece of nonsense about a Yankee boy and the Emperor of Russia, or plays the tender at the funeral of a stranger on the banks of the Mississippi. Yet, and after all due and large allowances are made for endless digressions and sentimental small talk, there are many clever papers in the volume—good magazine articles, and so like magazine articles, that we cannot doubt, though there is no hint of it in the way of Preface, that in this form they originally appeared. Be this as it may, we shall not concern ourselves further with the merits or demerits of the volume, but dip here and there for a few paragraphs, and thus give our readers some sketches of New York by an American:—

"You ask what is now my opinion of this great Babylon; and playfully remind me of former philippics, and a long string of vituperative alliterations, such as magnificence and mud, finery and filth, diamonds and dirt, bullion and brass-tape, &c. &c. * * Well, Babylon remains the same as then. The din of crowded life, and the eager chase for gain, still run through its streets, like the perpetual murmur of a hive. Wealth dozes on French couches, thrice piled, and canopied with damask, while poverty camps on the dirty pavement, or sleeps off its wretchedness in the watch-house. There, amid the splendour of Broadway, sits the blind negro beggar, with horny hand and tattered garments, while opposite to him stands the stately mansion of the slave trader, still plying his bloody trade, and laughing to scorn the cobweb laws, through which the strong can break so easily. In Wall-street, and elsewhere, Mammon, as usual, coolly calculates his chance of extracting a penny from war, pestilence, and famine; and Commerce, with her loaded drays, and jaded skeletons of horses, is busy as ever 'fulfilling the world's contract with the devil.' The noisy discord of the street-cries gives the ear no rest; and the weak voice of weary childhood often makes the heart ache for the poor little wanderer, prolonging his task far into the hours of night. Sometimes, the harsh sounds are pleasantly varied by some feminine voice, proclaiming, in musical cadence, 'Hot corn! hot corn!' with the poetic addition of 'Lily white corn! Buy my lily white corn!' * * I will answer your question, by saying that, though New York remains the same, I like it better. This is partly because I am like the Lady's Delight, ever prone to take root, and look up with a smile, in whatever soil you place it; and partly because blonted disease, and black gutters, and pigs uglier than their ugly kind, no longer constitute the foreground of my picture of New York. I have become more familiar with the pretty parks dotted about here and there; with the shaded alcoves of the various public gardens; with blooming nooks, and 'sunny spots of greenery.' * * I like the various small gardens in New York, with their shaded alcoves of lattice-work, where one can eat an ice-cream, shaded from the sun. You have none such in Boston; and they would probably be objected to, as open to the vulgar and the vicious. I do not walk through the world with such fear of soiling my garments. Let science, literature, music, flowers, all things that tend to cultivate the intellect, or humanize the heart, be open to 'Tom, Dick, and Harry;' and thus, in process of time, they will become Mr. Thomas, Richard, and Henry. In all these things, the refined should think of what they can impart, not of what they can receive."

Here are a few sentences on the endless variety of character, and the changing population of New York:—

"In a great metropolis like this, nothing is more observable than the infinite varieties of character. Almost without effort, one may happen to find himself, in the course of a few days, beside the Catholic kneeling before the cross, the Mohammedan bowing to the east, the Jew veiled before the ark of the testimony, the Baptist walking into the water, the Quaker keeping his head covered in the presence of dignitaries and solemnities of all sorts, and the Mormon quoting from the Golden Book which he has never seen. More, perhaps, than any other city, except Paris or New Orleans, this is a place of rapid fluctuation, and never-ceasing change. A large portion of the population are like mute actors, who tramp across the stage in pantomime or pageant, and are seen no more. The enterprising, the curious, the reckless, and the criminal, flock hither from all quarters of the world, as to a common centre, whence they can diverge at pleasure. Where men are little known, they are imperfectly restrained; therefore, great numbers here live with somewhat of that wild license which prevails in times of pestilence. Life is a reckless game, and death is a business transaction. Warehouses of ready-made coffins, stand beside warehouses of ready-made clothing, and the shroud is sold with spangled opera-dresses. Nay, you may chance to see exposed at sheriff's sales, in public squares, piles of coffins, like nests of boxes, one within another, with a hole bored in the topmost lid to sustain the red flag of the auctioneer, who stands by, describing their conveniences and merits, with all the exaggerating eloquence of his tricky trade. There is something impressive, even to painfulness, in this dense crowding of human existence, this mercantile familiarity with death."

Here is a glimpse of some of the New York characteristics:—

"Among the many objects of interest in this great city, a stranger cannot overlook its shipping; especially as New York lays claim to superiority over other cities of the Union, in the construction of vessels, which are remarked for beauty of model, elegance of finish, and gracefulness of sparring. * * You will not think the millennium is nigh, when I tell you that the most graceful, fairy-like vessel in these waters was a slaver! She floated like a sea-nymph, and cut the waves like an arrow. I mean the Baltimore clipper, called the Catharine; taken by British cruisers, and brought here, with all her detestable appurtenances of chains and padlocks, to be adjudged by the United States' Court, condemned, and sold. For what purpose she is now used, I know not; but no doubt this city is secretly much involved in the slave trade."

The following scene is truly American:—

"A friend passing by the methodist church in Elizabeth Street, heard such loud and earnest noises issuing therefrom, that he stepped in to ascertain the cause. A coloured woman was preaching to a full

Digitized by Google

audience, and in a manner so remarkable that his attention was at once riveted. The account he gave excited my curiosity, and I sought an interview with the woman, whom I ascertained to be Julia Pell, of Philadelphia. I learned from her that her father was one of the innumerable tribe of fugitives from slavery, assisted by that indefatigable friend of the oppressed, Isaac T. Hopper. This was quite a pleasant surprise to the benevolent old gentleman, for he was not aware that any of Zeek's descendants were living; and it was highly interesting to him to find one of them in the person of this female Whitfield. Julia never knew her father by the name of Zeek; for that was his appellation in slavery, and she had only known him as a freeman. Zeek, it seems, had been 'sold running,' as the term is; that is, a purchaser had given a very small part of his original value, taking the risk of not catching him. In Philadelphia, a coloured man, named Samuel Johnson, heard a gentleman making inquiries concerning a slave called Zeek, whom he had 'bought running.' 'I know him very well,' said Samuel; 'as well as I do myself; he's a good-for-nothing chap; and you'll be better without him than with him.' 'Do you think so?' 'Yes, if you gave what you say for him; it was a bite—that's all. He's a lazy, good-for-nothing dog; and you'd better sell your right in him the first chance you get.' After some further talk, Samuel acknowledged that Zeek was his brother. The gentleman advised him to buy him; but Samuel protested that he was such a lazy, vicious dog, that he wanted nothing to do with him. The gentleman began to have so bad an opinion of his bargain, that he offered to sell the fugitive for sixty dollars. Samuel, with great apparent indifference, accepted the terms, and the necessary papers were drawn. Isaac T. Hopper was in the room during the whole transaction; and the coloured man requested him to examine the papers to see that all was right. Being assured that everything was in due form, he inquired, 'And is Zeek now free?' 'Yes, entirely free.' Suppose I was Zeek, and that was the man that bought me; couldn't he take me?' 'Not any more than he could take me,' said Isaac. As soon as Samuel received this assurance, he made a low bow to the gentleman, and, with additional fun in a face always roguish, said, 'Your servant, sir; I am Zeek.' The roguishness characteristic of her father is reflected in some degree in Julia's intelligent face; but imagination, uncultivated, yet highly poetic, is her leading characteristic." * * I asked Julia if she had ever tried to learn to read. She replied, 'Yes, ma'am, I tried once; because I thought it would be such a convenience if I could read the Bible for myself. I made good progress, and in a short time could spell B-a-k-e-r as well as anybody. But it dragged my mind down. It dragged it down. When I tried to think, everything scattered away like smoke, and I could do nothing but spell. Once I got up in an evening meeting to speak; and when I wanted to say, "Behold the days come," I began "B-a—." I was dreadfully ashamed, and concluded I'd give up trying to learn to read.' These and several other particulars I learned of Julia at the house of Isaac T. Hopper. When about to leave us, she said she felt moved to pray. Accordingly, we all remained in silence while she poured forth a brief but very impressive prayer for her venerable host, of whom she spoke as 'that good old man, whom thou, O Lord, hast raised up to do such a blessed work for my down-trodden people.' Julia's quiet, dignified, and even lady-like deportment in the parlour, did not seem at all in keeping with what I had been told of her in the pulpit, with a voice like a sailor at masthead, and muscular action like Garrick in Mad Tom. On the Sunday following I went to hear her for myself; and, in good truth, I consider the event as an era in my life never to be forgotten. Such an odd jumbling together of all sorts of things in Scripture, such wild fancies, beautiful, sublime, or grotesque, such vehemence of gesture, such dramatic attitudes, I never before heard and witnessed. I verily thought she would have leaped over the pulpit; and if she had, I was almost prepared to have seen her poise herself on unseen wings, above the wondering congregation. I know not whether her dress was of her own choosing, but it was tastefully appropriate. A black silk gown, with plain white cuffs; a white muslin kerchief, folded neatly over the breast, and crossed by a broad black scarf, like that which bishops wear over the surplice. She began with great moderation, gradually rising in her tones, until she arrived at the shouting pitch common with Methodists. This she sustained for an incredible time, without taking breath, and with a huskiness of effort that produced a painful sympathy in my own lungs. Imagine the following thus uttered; that is, spoken without punctuation:—'Silence in Heaven! The Lord said to Gabriel, bid all the angels keep silence. Go up into the third heavens, and tell the archangels to hush their golden harps. Let the mountains be filled with silence. Let the sea stop its roaring, and the earth be still. What's the matter now? Why, man has sinned, and who shall save him? Let there be silence, while God makes search for a Messiah. Go down to the earth; make haste, Gabriel, and inquire if any there are worthy; and Gabriel returned, and said, No, not one. Go search among the angels, Gabriel, and inquire if any there are worthy; make haste, Gabriel; and Gabriel returned, and said, No, not one. But don't be discouraged. Don't be discouraged, fellow sinners. God arose in his majesty, and he pointed to his own right hand, and said to Gabriel, Behold! the Lion of the tribe of Judah; he alone is worthy. He shall redeem my people.' You will observe, it was purely her own idea that silence reigned on earth and in heaven while search was made for a Messiah. It was a beautifully poetic conception, not unworthy of Milton. Her description of the resurrection and the day of judgment must have been terrific to most of her audience, and was highly exciting even to me, whose religious sympathies could never be roused by fear. Her figure looked strangely fantastic, and even supernatural, as she loomed up above the pulpit, to represent the spirits rising from their graves. So powerful was her rude eloquence, that it continually impressed me with grandeur, and once only excited a smile; that was when she described a saint striving to rise, 'buried perhaps twenty feet deep, with three or four sinners a top of him.' * * Luckily for the excited feelings of her audience, she changed the scene, and brought before us the gospel ship, laden with saints, and bound for the heavenly shore. The majestic motion of a vessel on the heaving sea, and the fluttering of its pennon in the breeze, was imitated with wild gracefulness by the motion of her hands. 'It touched the strand. Oh! it was a pretty morning! and at the first tap of Heaven's bell the angels came crowding round, to bid them welcome. There you and I shall meet, my beloved fellow travellers. Farewell—farewell; I have it in my temporal feelings that I shall never set foot in this New York again. Farewell on earth, but I shall meet you there,' pointing reverently upward. 'May we all be aboard that blessed ship.' Shouts throughout the audience, 'We will! we will!' Stirred by such responses, Julia broke out with redoubled fervour. 'Farewell—farewell. Let the world say what they will of me, I shall surely meet you in Heaven's broad bay. Hell clutched me, but it hadn't energy enough to hold me. Farewell on earth.' I shall meet you in the morning.' Again and again she tossed her arms abroad, and uttered her wild 'farewell;' responded to by the loud farewell of a whole congregation, like the shouts of an excited populace. Her last words were the poetic phrase, 'I shall meet you in the morning!' Her audience were wrought up to the highest pitch of enthusiasm I ever witnessed. 'That's God's truth!' 'Glory!' 'Amen!' 'Hallelujah!' resounded throughout the crowded house. Emotion vented itself in murmuring, stamping, shouting, singing, and wailing. It was like the uproar of a sea lashed by the winds."

"When the audience paused, Mr. Matthews, their pastor, rose to address them. He is a religious minded man, to whose good influence Julia owes, under God, her present state of mind. She always calls him 'father,' and speaks of him with the most affectionate and grateful reverence. At one period of her life, it seems that she was led astray by temptations, which peculiarly infest the path of coloured women in large cities; but ever since her 'conversion to God,' she has been strictly exemplary in her walk and conversation. In her own expressive language, 'Hell clutched her, but hadn't energy enough to hold her.' The missteps of her youth are now eagerly recalled by those who love to stir polluted waters; and they are brought forward as reasons why she ought not to be allowed to preach. I was surprised to learn that to this prejudice was added another, against women's preaching. This seemed a strange idea for Methodists, some of whose brightest ornaments have been women preachers. As far back as Adam Clarke's time, his objections were met by the answer, 'If an *Ass* reproved Balaam, and a *barn-door fowl* reproved Peter, why shouldn't a *woman* reprove sin?' This classification with donkeys and fowls is certainly not very complimentary. The first comparison I heard most wittily replied to, by a coloured woman who had once been a slave. 'Maybe a speaking woman *is* like an ase,' said she; 'but I can tell you one thing—the ass saw the angel, when Balaam didn't.' Father Matthews, after apologizing for various misquotations of Scripture, on the ground of Julia's inability to read, added, 'But the Lord has evidently called this woman to a great work. He has made her mighty to the salvation of many souls, as a cloud of witnesses can testify. Some say she ought not to preach, because she is a woman. But I say, "Let the Lord send by whom he *will* send." Let everybody that has a message, deliver it—whether man or woman, white or coloured! Some say women musn't preach, because they were first in the transgression; but it seems to me hard that if they helped us *into* sin, they shouldn't be suffered to help us *out*. I say, "Let the Lord send by whom he *will* send;" and my pulpit shall be always open.' "

We may hereafter, perhaps, select a paper or two, in which Mrs. Child wanders at her own free will,—some of those which, if they give no idea of New York, will convey a very good one of the state of transatlantic periodical literature.

The Tribes and Customs of Hy-Many, commonly called O'Kelly's Country. Translated from a MS. in the Library of the Royal Irish Academy, by J. O'Donovan, Esq. Dublin, printed for the Irish Archæological Society.

Hy-Many, or Maine's territory, included a large portion of the counties Galway and Roscommon; it belonged to the sept of the O'Kellys, and other cognate tribes, whose reputed common ancestor, Maine, is said to have conquered the country by the aid of St. Grellan. Saints in those days did not work miracles for nothing, and Grellan's demands for the aid he rendered are thus given in his Life:—

"Great is my tribute on the race of Maine,
a screaball (scruple) out of every townland.
Their successes shall be bright and easy; it
is not a tribute acquired without cause.
The first born of every family to me, that are
all baptized by me.
Their tribute *paid* to me is a severe tribute,
every firstling pig and firstling lamb
To me belongs—may their cattle thence be
the more numerous;—from the race of
Maine, the firstling foal.
Let them convey their tribes to my church,
besides territory and land."

The tract before us contains a very accurate and minute account of the families of Hy-Many, with incidental notices of their customs and forms of government. Into the genealogics of the O'Kellys, O'Maddens, and the other families connected with them, we need not enter—their interest is too local and too limited; but some of the customs deserve a slight notice, as illustrative of Irish life under the Brehon law. The O'Kellys were the hereditary marshals of the kings of Connaught, and in consideration of their military services were to possess the third part of all the fortresses and sea-ports of that country; the third part of all prizes and wrecks by sea, of hidden treasures, and of all mines and minerals discovered or to be discovered; together with the third part of all *Eric*, or reprisal, recovered by the kings of Connaught from other provinces for wrongs received. *Eric* was also paid as an atonement for homicide, and appears to have been a regular source of royal revenue; we are told that in Innishowen the *eric* for killing a man was one hundred and sixty-eight cows!

Digitized by Google

The tribes of Hy-Many were exonerated from military service during spring and autumn, that is, seed-time and harvest; neither need they follow the king of Connaught for a longer period than six weeks, which nearly coincides with the feudal term of military service, forty days.

There were certain administrators of ecclesiastical property called *comharbas*, whose functions are not very clearly defined; they appear to have been the official guardians of the property and privileges of the churches to which they belonged, for we find that all of the sept of Hy-Many were bound to be baptized in the church of Camma, sacred to St. Bridget, and that those who lived too far from the church, or did not wish to bring their children thither, were nevertheless obliged to pay their baptismal fees to the comharba. Another comharba had the fees for extreme unction, and a third those for burial. St. Grellan, whose crozier was the standard of Hy-Many, had also a comharba to receive the tribute which has been already noticed.

Various services to the head of the Hy-Many tribe, are assigned as hereditary favours to certain families; an humble imitation of the feudal tenure by grand serjeantry, but fully as minute in its details as the organization of the most potent feudal monarchy. It is not less curious that the O'Kellys should have recognized the kings of Cashel as their protectors against their own immediate monarchs, the kings of Connaught; indeed, it is stated that but for this foreign protection they would soon have been deprived of their lands and immunities. The customs indeed, which are enumerated, clearly belong to a barbarous state of society, where there was no strength in the central government, and consequently no sure protection for person or property. Until, however, we know more of the Brehon law than has yet been published, it is impossible to determine whether this was the original condition of Irish society, or whether it had been produced by the efforts of the Irish chieftains to introduce among their septs the principles and institutions of feudalism, which they had learned from their Anglo-Norman invaders.

Index Geologicus, by G. Bartlett.—A large diagram showing the relative position of the different stratified and unstratified rocks, &c., with the classification of the fossil remains and remarkable deposits characteristic of each stratum. It gives also the agricultural and horticultural character of each geologically pourtrayed surface, and comprises a great deal of useful information in a small space.

The observations of the Barometer (Flint and Crown Glass) are severally corrected for temperature, as also for capillarity.

DAYS' EXCURSIONS OUT OF LONDON.

Winchester.

HERE we are pilgrims taking a morning's ride to get a luncheon of a slice of bread and a horn of beer, given *gratis* to every one who knocks at the portal of the Hospital of St. Cross, near Winchester. The charitable gift is a sort of lone thing in all England—a remnant of ancient times and manners so rare that we are actually journeying some sixty-six miles to have evidence of it. Let it be noted that the distance is but a three hours' journey. Many a three hours' journey must have been undertaken in the twelfth century to obtain the bread and beer, but then the pilgrim could only have trudged the ten miles from Romsey Abbey, or at most the dozen miles from Netley. We now come from London to affect the vagrancy—and a very pleasant day's employment it is if we are able to bear the costly charges of the Southampton Railway for conveyance thither.

We will first ease our conscience on the head of travelling, before we enter upon scenes of the past, which the objects of the present day's excursion suggest. Years ago, before the age of railways, the ordinary price for an outside seat on the coach from London to Portsmouth or Southampton used to be ten shillings. It was the usual fare by the Red Rover Southampton coach, one of the quickest and best appointed coaches out of London. The fares by this railway to Southampton have at last risen to 20*s.*, 14*s.*, and 8*s.* respectively for the three classes of carriages. To Winchester the fares are 17*s.* 6*d.*, 12*s.*, and 6*s.* 6*d.*, though the distance is but sixty-four miles. The cheapest mode, that is, by the third class carriages, is only available once in the day, at seven o'clock in the morning at each terminus of the railway. The rates by the second class carriages, which of necessity are those most employed, average rather more than five miles for a shilling in long distances, and are therefore more than double the general omnibus fares in London. Throughout the metropolis you are carried by the omnibuses from five to eight miles for sixpence. There seems to be no principle in assessing the fares—the more you use this railway, the *higher* the rate. Thus for fifteen and a half miles, to Walton, you pay two shillings; but for thirty-one miles, to Farnborough, you pay five shillings and sixpence. The traffic to Hampton Court by this railway, which might be great at a shilling, as it is by the steam-boats, is comparatively small at one shilling and ninepence; the Directors do not seem to know that above 100,000 persons go there in a year. Such is a comparison of horse labour and competition with machinery and a practical monopoly. There is no remedy for all this but what the wit of the railway directors is likely to dole out, which, looking at the general management of this railway since Sir John Easthope's secession, does not shine very luminously. The management appears to be one great mistake for the interests both of the public and the company. But it is seldom that a practical conviction of this overtakes the directors; it happened a year or so ago at Weybridge, where an attempt to raise the fares fifty per cent. nearly made the station there a sinecure, and if we are correctly informed, actually lowered the positive receipts. The great experiment of reducing the fares on the Brighton Railway has thus far been eminently successful; and, as a line used greatly for pleasure travelling, the South Western is like that of Brighton. When travelling is for pleasure's sake, optional and not imperative, cheapness is most important in determining the choice. That the inevitable expenses on this railway are not made to yield the greatest receipts, any one who watches the state of the often half-empty carriages can have no doubt. Not only in the charges, but in the state of the carriages, is the management short-sighted. Unlike the second-class carriages on other railways, which are separated by three or more partitions, those used on this are open from end to end. Thus the seats at the end receive the most pitiless currents of wind and rain—air at all times—seasoned with the cinders from the engine. These seats expose the occupants much more to the chances of cold even than the wholly open third class carriages. These latter are open at the foot, and are as little comfortable as it is possible for them to be. In consequence of these practical grievances of travelling, we doubt if the Southampton Railway is much used for other purposes than those of absolute necessity; and yet it is a railway which leads to all sorts of attractive

Digitized by Google

varieties in nature and art. The scenery has many peculiarities, because the road is cut through many geological varieties—clay, sand, chalk, all through the "upper marine" sand formation; the views along the road are remarkably attractive for a character of romantic wildness, which no other railway near to London offers. But it is time we leave the railway, and deposit ourselves at Winchester, trusting that the practical result of these observations may at some future time enable the reader to make a day's excursion to the ancient city for a sum of 10*s.* there and back, which might be done with great profit to all parties. As we have before remarked, third class carriages start at seven in the morning from Nine Elms; but there are none to return by, so that the minimum of cost of carriage will be 18*s.* 6*d.*

The seven o'clock train arrives at Winchester in time to enable you to attend the morning service at the Cathedral,—not that the choir is too strong in numbers or too careful in the style of its performances; and we *have* been present when the anthem was curtailed of its due quantity, and diminished from five verses to a single verse—a mere accident, no doubt, yet begetting disagreeable impressions. Still our advice is to take the chance of all laxities of performance, and attend the service. It takes a good deal to strip the tones of the boys' soprani—heard only in cathedrals—of their fresh purity, devotional solemnity, and impressiveness.

Winchester, like our Westminster Abbey or St. Paul's, has not imitated the good example of Norwich and Durham Cathedrals, and thrown open its doors to those who may desire to meditate within its walls, and the ordinary visitor is attended by a parroting verger; but we understand that much liberality is shown by the Winton authorities in affording facilities to artists and others desirous of studying the building. The visitors of a single day are not among these classes, and must, therefore, be patient under the guidance of a verger. For this class—rather than the architectural student—we shall point out a few of those features for which Winchester stands remarkable among English cathedrals, and which may be examined in the hasty glance which the presence of a verger obviously imposes.

As at York, Westminster Abbey, Canterbury, and almost every other ecclesiastical foundation of any magnitude, so here, the first Christian king, Lucius, is traditionally said to have been the founder of Winchester Cathedral. Here, indeed, authorities are quoted which give the actual height, breadth, and depth of the structure, which was dedicated by him to "the Holy Saviour"; and a flat grey marble monument, rising slightly above the ground before the entrance of the Lady Chapel, is shown as King Lucius's tomb. Milner, however, says that Bishop Geoffry de Lucy, who actually built this part about 1200, was buried here, and has been converted into King *Lucius!* King Lucius's church was thrown down by Diocletian, but again rebuilt, and then turned into a pagan temple by the victorious Cerdic, who was crowned here King of the West Saxons in 519. It became a Christian church again on the conversion of Kinegils, and rebuilt by him and his son Kenewalch in 548. This structure is said to have remained until the Danish conquest, when falling into decay, it was again restored by St. Ethelwold in 980. It is the opinion of Warton that a portion of St. Ethelwold's structure is still remaining at the east end of the church, near the tombs of Waynflete and Cardinal Beaufort; but Dr. Milner, a much better authority, is of opinion that "all that remains visible of the works of St. Ethelwold are the crypts themselves, or the chapel under the part that we have been speaking of, the walls, pillars, and groining of which remain in much the same state as he left them." These crypts are not generally visible. The building, however, which has been preserved to present times is substantially the work of the Norman prelate, Walkelin, which he completed between the years 1079 and 1093; for though William of Wykeham and others transformed the massive Norman masonry into a lighter and more florid work, still the low and heavy proportions of the whole fabric are really those of an early Norman period. Walkelin's architecture is left essentially untouched in the tower and the transepts. It is of a character as though it were to last till the end of the world, and will stand as a type of its age, when all the flimsy conceits of present times—fit representatives, too, of its unstable and transition character—will have mingled again with their original dust. Looking at these wonderful, huge masses of masonry, we may understand how their author, as the chroniclers tell us, according to his Titanesque notions of building, actually cut down a whole forest to supply the necessary timber; and we may understand, too, how William of Wykeham found it a much easier task to pare down the huge pillars into other forms, than to remove them and construct new ones, when he saw fit to modernize the old Norman masonry. The comparatively light perpendicular work seems stumpy and disproportionate; even in the absence of technical knowledge, any eye must trace a singular resemblance between the proportions of the circular columns and romanesque arches of the transepts, and the clustered shafts and pointed arches of the nave. To our view Wykeham's work here seems like an involuntary *cross* between two opposite styles, and for this reason to be eschewed as a model.

It must be confessed, too, that Winchester, both outside and inside, in its *general* features is monotonous and heavy, and will not bear comparison with Westminster Abbey, or York, or Canterbury, for variety and picturesque beauty; in its exterior especially, which is bald, wanting those necessary adjuncts—cloisters and a chapter-house. The scrubbing off the coats of whitewash gives the masonry a *freshness* which is at variance with the general associations suggested by the building. This is not only the case here, but in most cathedrals in this age of restoration. Happily Westminster Abbey has escaped all wash, excepting the leaden wash of Chantrey in the south transept, and has thus retained a venerable charm and beauty in its colouring, and in the effects of its lights and shadows, which place it on the highest pinnacle of picturesqueness. Still there are parts of Winchester of unrivalled beauty. The chantries of Beaufort, Wayneflete, and Fox are all consummate specimens of intricate elegance, and each one worthy of minute study; but the full effect of them is wanting, so long as they are deficient in colour. The visitor, when near to Fox's chantry, will not pass without observation the uncouth medley of Grecian and Gothic forms, displayed in the chantry of Bishop Gardiner. The chapels in the east of the Cathedral abound in rebuses, of which an amusing collection might be made. Thus, to commemorate Bishop Langton, there is the *long* musical note inserted in a *tun;* and a *vine* growing out of a *tun*, represents his see of Winton. Prior Hentun is represented by a *hen* on a *tun*, and Prior Silkstede by a *skein of silk* and a *steed*. Winchester is rich too beyond most cathedrals in the remnants of its encaustic tiles: "some call them caustic, Sir, and some the tessellated mosaic," as the verger told us. And here we may record the great learning which these functionaries seem to be imbibing, and which is a sign of the growth of public interest and knowledge in such subjects. Our friend here seemed quite aware that a painting on a stone wall was not a fresco; and at St. Cross we found the brother porter studying Bloxam's Architecture, and ready for an argument on the peculiarities of Norman ornaments. Winchester was a chosen place of sepulchre for the Saxon kings; and the visitor will see the mortuary chests, containing the bones of the Saxon monarchs, which Bishop Fox collected together, and placed above the screens, by which he separated the sanctuary from the aisles. The highly-decorated altar, covered with canopies, but stripped of images, will call to mind that at St. Alban's Abbey, to which it has a strong general resemblance; and the tameness of West's altar painting of the Raising of Lazarus, and its inaptness to its present locality, will not be passed unheeded. The apse of this cathedral is not imposing, and is far outstripped by that of Westminster Abbey.

The eastern extremity of the church consists of three chapels, each of which has some peculiarity worth notice. The southernmost for its florid oak panelling, in which the motto of "Laus tibi, Christe," repeated endlessly, is mixed in rich confusion with grapes, vines, armorial bearings, &c. Abbot Langton's altar tomb has been stripped of its brass effigies, of which species of monument Winchester does not possess a solitary specimen. The centre chapel is called the Lady Chapel, partly built by Geoffry De Lucy, of the thirteenth century, and completed by Prior Silkstede, of the sixteenth. The remains of Honest Isaak Walton, who died at Winchester, rest in this chapel. Remnants of numerous paintings on the walls may still be traced around this chapel: they have been called 'Frescoes,' but even the verger knows better than that now-a-days. The colouring does not appear to have been very bright at any time, and the outlines throughout are hard and strongly marked. The subjects, which are given in Carter's specimens of ancient sculpture and painting, allude to miracles wrought by the interposition of the Virgin, and are fully set out in Dr. Milner's historical account of the cathedral, a cheap and excellent guide-book, with which the visitor should provide himself. Considering that this work was written at the end of the last century, it is remarkable for the general soundness of its architectural criticism, and the apprehension of correct principles in art. A handsome old chair covered with velvet, remains in this chapel, and is said to have been Queen Mary's seat at her marriage with Philip of Spain, which was solemnized here. There is a miserable painted Grecian altar-piece in this chapel—the removal of which would be a good deed—and but one modern monument, a kneeling figure to the memory of Dr. Brownlow North, executed by Chantrey, not so sculpturesque as picturesque, and said to be a capital likeness. In the adjoining chapel, on the north, which is said by Milner to have been dedicated to the guardian angels, the paintings on the vaultings, being medallions encircling angels and blue stars, are very perfect. The colours are still quite bright, and it would seem to us to have furnished a general model for the decorations on the ceiling at the Temple Church. But the most interesting of all the ancient paintings in Winchester are those in a gloomy chapel below the organ stairs in the north transept. They seem to us more like genuine frescoes than any we have yet found in any ecclesiastical building. They are indisputably on a thick coat of plaster, laid on the masonry, and the colours do not appear to be easily removable from the mortar. The nature of our visit, and want of sufficient light, did not enable us to detect any junctions in the mortar, the existence of which would decide the question of their being fresco, but having called attention to this point, some one enjoying the means of full examination will perhaps determine it. These paintings appear to be the oldest existing in the church; they are, without doubt, on one of the oldest parts. The subjects represent the descent of Christ from the Cross, the laying the body in the Sepulchre; Christ's appearance to Mary Magdalen, &c.; and hence the chapel is called that of the Holy Sepulchre. Fragments of other paintings may be traced on the walls of the north transept.

Winchester Cathedral has not suffered much (though it has not altogether escaped) by the insertion of impertinent modern monuments. Among the best, rather happily located, is Mr. Richard Westmacott's monument to Bishop Tomline, in the nave. The remains of stained glass are few, and are limited to the east and west windows; in the former they are not very early, but are sufficiently perfect to exhibit their depth of colouring and brilliancy; whilst the latter exhibits a sort of patchwork of fragments culled from all parts, and mingled in the same incongruity as old ladies make counterpanes.

As the visitor passes into the nave from seeing the eastern part, he must not neglect to examine Wykeham's chantry, which though it has been despoiled of many of its images, and ornaments, and colouring, is yet a model of symmetrical beauty. Wykeham's marble effigy rests upon an altar tomb in full episcopal dress, with mitre, crosier, tunic, alb, &c., his head supported by two angels, and the figures of three monks are at his feet. Another object deserving of note in the nave, is the ancient font, of which the Society of Antiquaries has engraved two plates. Milner calls this font the 'Crux Antiquariorum,' or Puzzle of Antiquaries, and sets forth at length the theories formed upon the meaning of the rude sculptures on its square sides. Some suppose them to represent the history of St. Birinus, the apostle of the West Saxons, and consider it the workmanship of the seventh century. "But this," says Dr. Milner, "is evidently dating it too far backward, for certainly baptism by immersion, which was

Digitized by Google

performed by means of a bath made for this purpose, in a building distinct from the church itself, called a baptistery, was the practice in this kingdom, as well as in other parts, of the church, at the time in question, and for above two centuries later. Now the font before us is not calculated for this mode of baptizing, but rather for that of infusion or aspersion." The Doctor's own notion on the hieroglyphics is, that they allude to the miracles of St. Nicholas, of Myra, who lived in the fourth century, and was the patron saint of little children. But we can do no more at present than call attention to the font itself, which is large and square, formed out of a sort of serpentine marble, resting on a circular grooved pillar and four smaller pillars. We shall avail ourselves of a passage from Dr. Milner to lead us out of the cathedral. It carries us back to the time when the cathedral was a much more magnificent show-place than it is in the present age. "The only remaining object that claims our attention in the north aisle, previously to our quitting the cathedral, is the tribune which closes the upper part of it at the western extremity, being of the same workmanship with the rest of Wykeham's fabric, and of course part of his original plan. This is at present made use of as an ecclesiastical court, but seems to have been erected in order to contain the extraordinary minstrels who performed on grand occasions, when some prelate, legate, or king was received at the cathedral in solemn state by a procession of the whole convent. At such times the cross-bearers, acolyths, and thurifers led the way, the bishop, prior, and other dignified clergy in their proper insignia and the richest vestments, closing the ranks. In the meantime, the church was hung from one end to the other with gorgeous tapestry, representing religious subjects, the large hooks for supporting which still remain fixed to the inside of the great columns; the altars dazzled the beholders with a profusion of gold, silver, and precious stones, the lustre of which was heightened by the blaze of a thousand wax lights, whilst the well-tuned voices of a numerous choir, in chosen psalms and anthems, gave life and meaning to the various minstrelsy that was performed in this tribune."

The path of the visitor to the college is across the southern precinct of the cathedral, over a trimly-kept green lawn, inclosed by the most comfortable and spacious residences, suggestive of the best of creature comforts. Indeed, the whole air of the parts immediately contiguous to the cathedral is so extremely orderly and respectable, that something of the picturesque is lost thereby.

We have next, as part of our day's excursion, to proceed to Wykeham's College, thence over the meadows to the hospital of St. Cross, back by the old castle walls along the banks of the Itchen, and then to climb one of the chalk heights to get a bird's eye view of the city; and though time may be found for all this in one day, sufficient space to give even a compressed account of the hasty glances cannot be found in one paper of the *Athenæum*, so the rest of our Winchester Excursion must remain due for the present.

SIR JOHN HERSCHEL ON THE REFLECTING TELESCOPE OF THE LATE SIR WILLIAM HERSCHEL.

Sir,—In your report of Dr. Robinson's speech at the close of the Meeting of the British Association, at Cork [*ante*, p. 866], there occurs a passage which induces me to trouble you with a few remarks. Agreeing with Dr. Robinson most cordially in the very high praise which he bestows on Lord Rosse's great achievements in the construction of reflecting telescopes, and filled, no less than himself, with wonder and admiration at his Lordship's last astonishing effort, I cannot but think that, considering the eloquent speaker's unlimited command of language, he might have found abundant means of illustrating a subject so capable of standing on its own merits without going out of his way to apply to the greatest work of the kind which had previously been executed an epithet both derogatory and unjust. I allude to the reflecting telescope, of four feet aperture and forty feet in focal length, constructed by the late Sir William Herschel; which instrument, Dr. Robinson is reported to have said, "however honourable to the astronomer and the king who constructed it, must be regarded as a failure:" the sense in which it is to be so regarded being (as the context shows) that of its performance as an optical instrument; and the question brought into issue being the adequacy of the methods invented and practised by its constructor to communicate a satisfactory figure and polish to reflectors of a large size.

Now, Sir, I contend that an instrument cannot, either optically or astronomically speaking, be justly termed a failure which, *the very first moment* that it was turned upon the heavens for the purpose of astronomical observation, added a new body to the solar system; a discovery which is recorded by its author in these words:—"In hopes of great success with my forty feet speculum, I deferred the attack upon Saturn till that should be finished, and, having taken an early opportunity of directing it to Saturn, the very first moment that I saw the planet, I was presented with a view of six of its satellites, in such a situation and so bright as rendered it impossible to mistake or not to see them."

The sixth satellite of Saturn may, however, be seen, under favourable atmospheric circumstances, with a reflector of eighteen inches aperture, without the observer being previously advertized, by calculation, of its exact place; and was, in fact, so seen, on one occasion, at least, previous to this its distinct recognition as a satellite, with the larger telescope, being then, however, noticed only as a star accidentally near the planet. But the *seventh* satellite, whose discovery, with the forty-feet reflector, followed that of the sixth within less than a month, is an object of a far higher order of difficulty, and could not possibly have been detected with any other telescope then in existence.

But as an unequivocal proof of excellent performance of the speculum in question, I come to what I believe every astronomer at all familiar with the action of large telescopes will regard as a *tour de force*, an unequivocal proof of great perfection having been attained in the *figure* of the mirror. The following is the record of the observation to which I allude. "Oct. 16. *I followed the sixth and seventh satellites up to the very disc of the planet, and the ring, which was extremely faint*, [this was at a time when the ring was invisible in all other existing telescopes] *opposed no manner of obstruction to my seeing them gradually approach the disc, where the seventh vanished at* $21^h\ 46^m\ 44^s$ *and the sixth at* $22^h\ 36^m\ 44^s$." The disappearance of the seventh satellite behind the disc of Saturn occurs at least once every twenty-four hours, and to show it in the act of entering on the disc or passing behind it, may, and probably will, be an every-day performance for a reflector of six feet in diameter, but until this beautiful phenomenon shall have been exhibited by some reflector of such dimensions as Dr. R. would term "comparatively diminutive," I shall continue to protest against the term *failure* as applied to the forty-feet.

Though exceedingly anxious in this communication to avoid any the slightest appearance of comment on Lord Rosse's combinations, which, so far as I understand them, appear admirably good, yet when Dr. Robinson remarks on the principle of obviating flexure by uniform support of every point of the mirror in the act of observation, as a thing "never before thought of," I cannot help observing, as respects my own practice, that I have long been aware of the extreme importance of this principle, and constantly acted upon it in all my observations, at least since the year 1829, in a manner at once the most simple, effectual, and *un-costly* which I believe it possible to devise. For details, however, and for the mode of obviating the only inconvenience (but that a most formidable one) which the principle of uniform support is apt to induce in practical observation, I must refer to my forthcoming work on the Southern Hemisphere, in the introductory chapters of which several paragraphs are devoted to the discussion of the causes which prevent perfect action in reflectors, and the means of obviating them, and the comparison, in respect of these causes, between reflecting and refracting telescopes. I have the honour to be, &c.

J. F. W. HERSCHEL.

Collingwood Sept. 27, 1843.

FOREIGN CORRESPONDENCE.

Cairo, August 23rd.

THE Nile has risen three inches since yesterday: it is now by the Nilometer of the island of Roda 19 cubits 14 inches: so it is reported by the crier. Yesterday I was on the island, and our countryman, Mr. Traill, the man who has converted a large portion of the island into a garden, showed me a plant, from Yemen, the leaves of which are masticated by the people of that part of Asia, and said to produce sleeplessness, talkativeness, and a liveliness quite amiable. It has none of the bad effects of opium. Who knows, but it may become as universal in the west as tobacco in the east, a kind of counter present which the east makes for the tobacco.*

Aug. 25.—The Nile has not risen to-day one single inch. A few days ago I happened to be at the English hotel, where also were several other Englishmen. It was proposed to send for the celebrated conjuror—the very same man who performed the wonders described by Lord Prudhoe, Lane, and others. I knew him again, although he did not know me. The first act of imposition he performed, was to demand a dollar, 20 piastres, to buy the necessary perfumes for the incantation: he was offered a piece of 9 piastres which he said was insufficient: some one then handed to him the 20 piastres, and he sent his son into the market, who returned with a farthing's worth of frankincense and a farthing's worth of coriander seeds. A boy was then sent for, who was placed in a chair in the midst of us, a chafing dish with some charcoal under his nose on the ground; certain sentences were then written on a piece of paper, which was torn sentence by sentence and so burned, the conjuror throwing into the fire, at the same time, some seeds and crumbs of frankincense and muttering the incantation. I forgot to say, that he had already drawn on the boy's right palm a square figure with some Arabic numbers in the corners, and a pool of ink in the centre, in which the boy was ordered to look, inhaling, at the same time all the fumes of the incense, the seeds and the burning paper. He was then asked if he saw a man sweeping; when he had said yes, he was told to bid the Chouish (servants who attend persons of dignity) to bring a tent and put it up: this being done, (all seen distinctly in the spot of ink) he was told to send one of the men for the sultan, and when he had arrived on a white horse, attended by a numerous retinue, and coffee had been given him, he was then ready to call and to make appear, in the presence of the sultan, any person that we desired him to see, and we were to judge, from the description the boy gave of the person thus summoned to appear, of the efficacy of the incantation. The old conjuror continued all the while, at intervals, to throw more of the incense and seeds into the fire. Mr. C—— proposed that the boy should see Mr. Farish, whom he forthwith described as visible in the ink, dressed in a straw hat, white trowsers and black coat, with yellow hair, reddish face, of middle stature, and without spectacles; he afterwards saw and described Sir H. Harding, as neither fat nor thin, with white trowsers and waistcoat, hands and feet entire. I need not trouble you with all the people we summoned with various success, the boy having shrewdness enough, from the leading questions which were put to him, to make now and then a tolerable guess: there were, however, two others, the Sultan of Rome and Mr. O'Connell. Pope Gregory XII. came on a white horse, dressed like a Frank, with white trowsers and a hat: Mr. O'Connell wore a hat with gold lace, was neither fat nor thin, without a beard and quite a lad. We had had enough by this time, and the boy was dismissed, taking with him a gold piece which the old impostor had asked one of the bystanders to give him, it being necessary, for the

* The Kât plant, supposed by some late writers to be the Tea plant. But the Editor of the *Gardeners' Chronicle* observes—"This plant is not Tea, but the *Catha edulis* of Forskâhl, now called *Celastrus edulis*. According to that author it is the Kât or Gât of the Arabs, by whom it is cultivated in Yemen along with Coffee. They eat the green leaves with greediness, believing them to have the power of causing extreme watchfulness, so that a man may stand sentry all night long without drowsiness. They also regard it as an antidote to the plague, and assert that a person wearing a twig of it in his bosom, may go among the infected with impunity; they even believe that the plague cannot appear in places where the tree is cultivated. 'Nevertheless,' says Forskâhl, 'the taste of the leaves does not seem to indicate such virtues. The leaves gathered when the plant is three years old, are sold as Kât mubarreh, or inferior Kât. The following year the young shoots are gathered, and fetch a higher price. They taste like a fresh filbert. The Kât, when quite fresh, is very intoxicating—(Botta, Voyage dans l'Yemen, p. 99); but its ordinary effect is to exhilarate the spirits, to promote good humour and vivacity of mind.' We have tried the quality of the infusion in hot water, but are unable to say anything in its favour."

Digitized by Google

success of the operation, that the piece of money should have a hole in it. We then paid the conjuror 10 piastres a piece and dismissed him, thoroughly satisfied that the great secret of his art resides rather in the willingness of our countrymen to be deceived than in any merit of his, beyond that of getting a good deal of money, if merit it be. On one occasion lately the Prince of Wales was summoned to appear, and was described as a middle-aged man with mustachios, but no beard, white trowsers, black coat, straw hat, in short, the usual dress of the Franks of Cairo. It might happen that our young Prince did wear a straw hat, and if nothing had been said about the mustachios, age, &c., this would have been willingly accepted as a proof of the conjuror's intimacy with the Prince of Deceivers, with whom, I can assure you, he has no farther connexion than any countryman of his would be glad to have, on the same terms—that is, of getting money out of the pockets of the Franks by false pretences.

Aug. 28.—Yesterday morning I was on the island of Roda: the Nile has not risen these two or three days.—Mr. Traill gave me some of the extraordinary tree I have spoken of, specimens of which I will bring over to Europe. I persuaded Traill to plant a great deal more of it. The Prussian expedition is at Bene Soueff,—a remarkable word, which has a meaning in Arabic most probably from its position. Souef signifying the throat; the town being situated on the banks of the Nile, just where the Bahr nouf branches off to supply the Faioum. The inhabitants of this province being chiefly composed of Arabs of the desert, they are distinguished from their neighbours by the name of Bene Souef, the sons of the throat, of the province of the throat. I think I told you of one of the members being so ill that he was ordered to return to Europe. The mission is now reduced to the doctor, the architect, and two draughtsmen, and the clergyman Abeken, who does not belong to it, but intends to accompany the doctor—*en ami*.

OUR WEEKLY GOSSIP.

THERE is a kind of secular desecration often committed with impunity, but against which we beg to launch a few gentle anathemas. It consists in destroying, defacing, or defiling edifices, and monuments, other than ecclesiastical, though sanctified by the *mens divinior* that bodied them forth, and still lingers about them. Such acts of sacrilege our most regular churchgoers perpetrate daily, and we signalize one for its pre-eminent shamefulness: a work of England's sovereign architect, Sir Christopher Wren, endures injuries and ignominious usage which the Puritans themselves would have spared it, even had it been a cathedral. His so-christened "College of Physicians" is now degraded into a Butchery! What call you this but profaning it? At worst it was built for slayers of men, not of beasts. Had it no better claim upon national reverence and care, it merits both as the scene of Garth's 'Dispensary,' as an architectonic illustration of his poem—

> Not far from that most celebrated place
> Where angry Justice shews her awful face,*
> Where little villains must submit to fate
> That great ones may enjoy the world in state,
> There stands a Dome, majestic to the sight,
> And sumptuous arches bear its oval height—
> This pile was, by the pious patron's aim,
> Raised for a use as noble as its frame!

Had the poet turned another Sibylline leaf, he would have found something like this addition—

> Though doomed, in future times, to be debased
> By some vile use, ignoble as their taste!

The structure has intrinsic pretensions to honourable treatment, being considered a perfect specimen of architectural *fitness*, so that its very deformities became, like a camel's hunch or swine's snout, beautiful provisions for their purposes. We cannot pronounce the high peaked lantern more than a masterpiece of ugly utility, but this feature excepted, the elevation displays much merit in the Italian style. Garth has a fling at the gilt ball—

> A golden globe, placed high with artful skill,
> Seems, to the distant sight, a gilded *pill!*

Yet nothing could be more appropriate, and perhaps Sir Christopher, who had a dry humour of his own, intended the covert allusion, which Garth but interpreted. This fabric, when the Physicians removed to Pall Mall East, became an "Equitable Loan" office, and is at present divided between a braziery and, as we said, a shambles in Newgate Market! The sublimest modern architect since Michaelangelo his grateful countrymen leave unhonoured by statue or memorial, save a common hearth-stone flag, over his dust, huddled into a subterranean corner of St. Paul's; nor will even conserve,† nor preserve from unseemliest uses the monuments he raised to, though not for, himself,—which enshrine his genius, and breathe its spirit. Well done, Progress of Civilization! Our city authorities keep this admirable work as much hidden as if it were one of their own misdeeds—let it remain smothered up amidst offal and ordure, yea, amidst sluttishness so rank it smells to heaven, albeit perhaps myrrh and cassia unto their nostrils. Warton talks about "Architecture, like Milton's lion *pawing* to get free." A somewhat capricious image, whether it is the patron-Goddess that "paws" or the material object, but were such a thing possible, Wren's college would certainly make a prodigious scramble to get free from its very unwholesome position.‡ Indeed, the entire district adjacent seems a storehouse of abominations; its uncleanliness must corrupt the very atmosphere; an effluvium which might beget a second Great Plague, renders each thoroughfare almost impassable, except to persons with false noses or none. Near Warwick Lane, where the ci-devant Temple of the Healing Art stands, Pestilence has now her chief depot of garbage, filth, and putrefaction: an arm of the New River turned thro' this Augean stable would scarce be sufficient to cleanse it. We acknowledge the street-nuisance so common in London above all other capitals—butchers' shops—and often do we perform most eccentric curves to keep these foci radiating evil smells, at remotest distance possible; but London markets are as bad as London church-yards, both exuding impalpable moisture pregnant with miasma; both evaporating a veritable slow poison more or less sucked up by the spungy lungs of our fellow-citizens east-ward. West-endians ourselves, we speak without interest, except for them and the general weal. Slaughter-houses, at least, should be banished, like cemeteries, to the suburbs, and made equally decorative there if desirable; our fellow-citizens, however, appear little less charmed with the neighbourhood of both than if they were beds of London-pride, and love-lies-bleeding. *De gustibus et disgustibus non est disputandum!* This has not been a crying abuse, but long time a silent one, and wanted the tongue which an organ of the press might lend it; we trust it will now make itself heard.

Public attention has been for some time past attracted to the subject of Etruscan Sepulchral Monuments. Amidst the vast variety which the precincts of Ancient Etruria contain, those of Castel d'Asso occupy a prominent place, and must have been impressed on the mind of the general reader by the lively description of Mrs. Hamilton Gray. Of this class of tombs, however, (which it will be remembered are situate in a picturesque valley, and decorated with an architectural façade, sculptured in the natural rock,) Castel d'Asso is by no means a solitary instance. The ravines of Norchia afford examples far more interesting to the archæologist, and Bilda presents them in greater variety, if not of equal importance. It has hitherto been thought, amongst archæologists, that this sort of tomb was found only in a district of ancient Etruria, now included in the pontifical states; we have just been informed that some have recently been discovered in Tuscany. Mr. S. J. Ainsley, an artist who has been occupied for some time in examining the sites of Etruscan cities, with the object of making drawings for an illustrative work which he contemplates publishing, amongst others visited those which are found in the Tuscan Maremma. In passing from Saturnia, a well ascertained Etruscan site, at the south-western corner of Tuscany to Chinsi, his road lay near the almost deserted town of Sovana, anciently Suana. Nothing was known of Etruscan antiquities at that place, and little mention is made of it in works treating of the topography of those parts: he, however, determined to visit it. He there found numerous sepulchres, decorated with architectural façades, similar to those of Castel d'Asso, and others very superior in interest and picturesque beauty. The first which he discovered is in the form of the portico of a temple. It has consisted of four fluted columns, of which the left hand corner one still stands, supporting a part of the pediment. Too little of this remains to show in what manner it has been decorated; but behind the column, attached to the smooth surface of the rock, representing the body of the temple, is a pilaster, fluted to correspond with the column, and with a similar capital; the design of which, although much injured by time, is still traceable. Another of the monuments is unlike anything hitherto known. It is a large and somewhat detached rock, which has been sculptured into something resembling a fountain. Its lower division, the surface of which has been chiselled quite smooth, has an arch hollowed out in it. This is surmounted by a frieze, which resembles more a rude Doric than any other order. Above it, without any interposed cornice, rises a sort of pediment, sculptured in bas-relief, with various emblematical figures, similar, on a large scale, to what are frequently found on the sepulchral urns or small cinerary sarcophagi of Volterra. There are evident indications that both these are sepulchres. There are other tombs, we understand, of a novel and interesting character, though not equal in importance to the two already described, and the inscriptions are numerous. In short, in no other place of Etruria is so great a variety found; while at the same time it possesses examples not to be found elsewhere. We hope the public will be soon favoured with a more detailed description of these interesting curiosities.

The committee of the Stoddart and Conolly Fund have applied to Lord Aberdeen, for the sanction and the aid of government, and we are glad to hear that his Lordship has promised every assistance in his power to Dr. Wolff, in his mission to Bokhara.

The student of Eastern literature will learn with pleasure that an opportunity is about to be afforded him, not only of securing many valuable works on the subject, but at the same time mementos of one of the fathers of Eastern lore, the late Dr. Gesenius, whose library will be sold by public auction on the 16th of January, and following days. The collection consists of the best works on biblical interpretation and ecclesiastical history, all the best Latin and Greek authors, besides the chief works extant in the Arabic, Æthiopic, Amharic, Syriac, Phœnician, Egyptian, Hebrew, Coptic, and other Oriental languages. Catalogues are, we believe, to be obtained of Messrs. Williams & Norgate, the foreign booksellers.

The season of the two patent theatres commences simultaneously; Drury Lane opening to-night and Covent Garden on Monday. The opera *corps* at Drury Lane includes all the available talent on our stage, H. Phillips excepted—Mrs. Alfred Shaw and Madame Albertazzi, Miss Romer and Miss Rainforth, Messrs. Giubelei, Stretton, Leffler, Harrison, and

* The Old Bailey.

† Elmes says—"This admirable structure being shortly to be *pulled down*, it is worth the inspection of the scientific architect, before it is destroyed." So for its continued existence it has been indebted to the tender mercies of butchers and braziers!

‡ Readers may like to know a little of its history. It constituted the Theatre and Entrance to the actual College, a quadrangle comprising apartments for professors, &c., hall and court-room, which was begun in 1674, and finished the year after the Revolution, 1689. An ambitious hunks of that age, Sir John Cutler, subscribed a round sum, and received public thanks, had a statue raised to him on the west front, and the theatre itself called after his name. We possess an earlier edition of Garth's poem, which contains a frontispiece of the eastern façade with THEATRUM CUTLERIANUM in the frieze. This adulation met its due reward: Sir John's executors brought a demand against the college sycophants, of *seven thousand pounds*, not only for the sum lent, but the sum given, and all the accumulated interest! Two thousand were accepted, the inscription was erased, the statue retained. Pope, however, has modelled out the best portrait of this distinguished Miser, and given it a conspicuous niche in the Temple of Infamy, next to that where Villiers duke of Buckingham, the forlorn spendthrift, is gibbetted:—

> His Grace's fate sage Cutler could foresee,
> And well, he thought, advised him—"Live like me":
> As well his Grace replied,—"Like you, Sir John?
> That I can do when all I have is gone!"
> Resolve me, Reason, which of these is worse,
> Want with a full, or with an empty purse?
> Thy life more wretched, Cutler, was confessed,
> Arise, and tell me, was thy death more blessed?
> Cutler saw tenants break, and houses fall,
> For very want—he could not build a wall!
> His only daughter in a stranger's power,
> For very want—he could not pay a dower!
> A few gray hairs his reverend temples crowned,
> 'T was very want that sold them for two pound!
> What even denied a cordial at his end,
> Banished the doctor, and expelled the friend?
> What but a want, which you perhaps think mad,
> Yet numbers feel—the want of what he had!
> Cutler and Brutus dying both exclaim,
> "Virtue and Wealth, what are ye but a name!"

Digitized by Google

Templeton, and Herr Brandt, a German tenor. Mr. Benedict is the musical director; and new English operas, as well as versions of Italian and German operas are promised. The principal novelty of the opening night is the new ballet from the Académie at Paris, 'The Peri,' in which Carlotta Grisi and M. Petipas are the principal dancers. Covent Garden propitiates the public by an appeal to the economical tendencies developed by the Income Tax, in the shape of a reduction of prices; the dress boxes being 5*s.*, the upper circles 3*s.* 6*d.*, the pit 2*s.* 6*d.*, and the gallery as before, 1*s.*, with proportionate half-prices. The play is 'Woman,' a serious drama, by Mr. Bourcicault, the cast of which includes Mr. and Miss Vandenhoff, Messrs. Anderson and Phelps, and Miss Cooper: it will be followed by two new farces, in which Mr. and Mrs. Keeley, and other favourites will appear. Other new pieces are already promised, and the manager seems determined to provide a constant supply of novelties. The Adelphi and the Olympic also open on Monday, as usual at Michaelmas. The Haymarket, which has produced nothing new, since our last mention of it, but a very dull farce, called 'News from China,' must now bestir itself to meet the competition of its rivals.

DIORAMA, REGENT'S PARK.

NOW OPEN, with a NEW EXHIBITION, representing the CATHEDRAL of NOTRE DAME at Paris, with effects of Sunset and Moonlight, painted by M. REMOUX, and the BASILICA of ST. PAUL, near Rome, before and after its destruction by Fire, painted by M. BOUTON. Open from Ten till Five.—N.B. A GRAND MACHINE ORGAN has been constructed expressly for this Exhibition, by Messrs. Gray and Davison, of the New-road, and will perform the Gloria, from Haydn's Service, No. 1, during the midnight effect of the Cathedral of Notre Dame.

RE-OPEN TO THE PUBLIC.

ROYAL POLYTECHNIC INSTITUTION.—FIRST PUBLIC EXHIBITION of Two important Discoveries in Science, viz.—ARMSTRONG'S HYDRO-ELECTRIC MACHINE, which will be exhibited Daily at Three o'Clock, and at Eight in the Evenings; and LONGBOTTOM'S OPAQUE MICROSCOPE, showing Objects in NATURAL HISTORY in all their varied Colours. LECTURES Daily on CHEMISTRY and NATURAL PHILOSOPHY by Dr. Ryan and Prof. Bachoffner. The arrangement of the OPTICAL DEPARTMENT is under the management of Mr. Goddard. DISSOLVING VIEWS and COSMORAMIC PICTURES, MODELS of all kinds of MACHINERY in MOTION, DIVER and DIVING BELL, &c. Conductor of the Band, T. Wallis, Mus. Doc. Open Mornings and Evenings, except Saturday Evenings. Admission 1*s.*—Schools Half-price.

SCIENTIFIC AND LITERARY

HORTICULTURAL SOCIETY.—*Sept.* 19.—G. Bain, Esq., in the chair. The Rev. R. C. Jenkins, C. R. Read, Esq., Mr. J. Youell, and Mr. J. Backhouse, were elected Fellows. From Mr. Mills was a cucumber, named Jewess, (an early forcing sort,) measuring in length 24¼ inches, and 3¼ inches in diameter; the stem on which it grew was 3¾ inches in circumference immediately above the ground.—T. Sowerby, Esq., sent a dish of Keen's Seedling Strawberries, highly-coloured and of excellent quality, being a second crop and gathered from plants that had been forced in spring: it was stated that he has been gathering fruit from them for more than three weeks past, and expects them to continue bearing until checked by the frosty nights. There is, however, nothing new in the system, although it is not generally adopted. From three years' experience, he adds, he finds a good crop now will not prevent the plants from bearing abundantly in the succeeding season, and states, moreover, that his best fruit during the months of June and July is generally obtained from plants that had been turned out of their forcing-pots in the preceding year; a certificate was awarded.

ENTOMOLOGICAL SOCIETY.—*September.*—E. Doubleday, Esq., V.P., in the chair. Dr. Becker, of Wiesbaden, exhibited specimens of *Papilio Scamander*, and another apparently new species of the same genus from South America. Mr. Evans exhibited specimens illustrating the transformations of *Mamestra brassicæ* and *Euthalia impluviata*. The following papers were read: 1. Notice of a Gynandromorphous individual of *Smerinthus populi* in which the characters of the two sexes were singularly intermixed, by Mr. G. A. Thrupp. 2. Description of an ancient Irish amulet made in the form of, and used as a charm against the murrain caterpillar, communicated by Mr. Evans. 3. Descriptions of some new exotic Spiders, and notices of the economy of other species of the same tribe, by Mr. A. White.

MEETINGS FOR THE ENSUING WEEK.

TUES. Horticultural Society, 3, P.M.
THUR. Zoological Society, 3.—General Business.
WED. Botanical Society, 8.

MISCELLANEA

The Pacific.—A letter from Stockholm states that a Swedish brig, freighted by an English firm at Port Philip to visit the small islands of the Pacific, touched at some islands probably not visited since Cook's time, and others not to be found in our maps, which the captain took possession of in the name of the King of Sweden. The inhabitants were a mild race, ignorant of the use of iron, and ready to give a turtle for even a rusty nail. They were also fond of bits of glass, and would remain for three or four hours shaving themselves with pieces of broken bottles. A single musket shot was sufficient to disperse thousands of them—a proof that they had not before been visited by Europeans. The king of one of the islands presented the captain with his sceptre, made of wood artistically carved, and having a thin circle of jasper on the top. A name was given by the captain to each of these isles, after some member of the royal family of Sweden, and a quantity of plants, and tools made of stone and wood, have been brought home.

Antiquarian Discoveries.—The *Times* gives an account of a discovery lately made in working a sand quarry on that part of Penrith Fell, in Cumberland, called "the Intack." In digging, the workmen came to a heap of cobble and freestones, on the removal of which was found a large freestone slab, on lifting which they discovered a freestone trough, filled with sand, among which were pieces of bones that appeared to be human. In the east corner of the receptacle was placed an earthen jar, or urn, without handles, neatly carved, but without date or inscription. From the shape of the jar, which is a little broken, and the nature of the material, it may be presumed to be of Roman origin.—From the *Kentish Observer* we learn that some investigations are in progress at Richborough Castle, under the direction of Mr. Rolfe of Sandwich. It appears that an excavation was commenced in 1822, to ascertain the state of a subterranean well and passage said to exist. The excavations were for a time abandoned but have lately been renewed. One or two passages have been broken into, and a long and thick wall has been met with, which the workmen are still employed in breaking through. Nothing of interest was found in the passages except the under part of a Roman vessel of clay, having three legs, probably used for cooking, and a few bones. Some marble has been turned up, of exquisite whiteness, in large and small fragments, one piece measuring 2 feet by 1¼ foot, worked with mouldings: it was found about 18 inches below the surface in sinking the shaft.

A Portable Light-house.—An invention has recently been made, for showing the position of a ship in danger, and thus directing the movements of persons attempting to give assistance from the shore. It consists of a composition, which when ignited gives a very distinct and brilliant light, and has been tried, it is said, with success at the Goldstone, where the *Pegasus* was wrecked.

Day's Windguard.—Mr. Day has submitted to us an invention for preventing that greatest of nuisances—a smoky chimney. It consists of a cap, to be placed on the top of the chimney, in which the openings whereby the smoke passes are guarded by plates of metal, in such a way that the smoke, instead of being driven by the wind down into the chimney, is blown out at the sides of these projecting plates. The contrivance seems to us to promise success, and its appearance is certainly an improvement on the variety of ugly fabrications for the prevention of smoke which decorate the chimney-tops of our houses.

Roman Remains.—Several chambers and baths have been discovered lately in the forest of Bretonne, in pursuing excavations begun in 1838. One chamber in particular has been found, fitted up most luxuriously. A fine mosaic with beautiful incrustations of waterbirds has been found in it, several coins of Nero, Antoninus, Gallienus, Claudius, &c., together with a number of household vessels and ornaments of brass, iron, and ivory.

TO CORRESPONDENTS.—A. J. E. will find an account of the Pneumatic, or Atmospheric, Railway in the volume of the *Athenæum* for 1835, p. 337.—Pro. Kugler's lecture has not been translated.—A correspondent suggests the following emendation in our British Association Report, Section D, p. 829: "Dr. Carpenter (in his paper on the structure of shells) did not state that the genus Pandora belonged to the Margaritaceæ; but that unlike its congeners, it agreed with that family in structure."

THE PITMAN'S PAY.

This day is published, in post 8vo. price 4*s.* cloth.

THE PITMAN'S PAY, and other Poems. By T. WILSON, Fell House, Gateshead Low Fell. Newcastle: Emerson Charnley. London: Simpkin, Marshall & Co.

SIR WALTER SCOTT'S WORKS.

George Bell, 186, Fleet-street.

FREEMASONS' and GENERAL LIFE ASSURANCE COMPANY, 11, Waterloo-place, Pall Mall, London.

Business transacted in all the branches and for all objects of LIFE ASSURANCE, ENDOWMENTS and ANNUITIES, and to secure CONTINGENT REVERSIONS, &c. Loans granted. Information and Prospectuses furnished by

JOSEPH BERRIDGE, Secretary.

ARGUS LIFE ASSURANCE COMPANY,

39, Throgmorton-street, Bank.

Empowered by special Act of Parliament, 5 & 6 Will. IV. c. 76.

Thomas Farncomb, Esq. Alderman, *Chairman.*
William Leaf, Esq. *Deputy-Chairman.*

Richard E. Arden, Esq.	Rupert Ingleby, Esq.
William Banbury, Esq.	Thomas Kelly, Esq. Ald.
Edward Bates, Esq.	Jeremiah Pilcher, Esq. Sheriff of London and Middlesex
Thomas Camplin, Esq.	Lewis Pocock, Esq.
James Clift, Esq.	
Rt. Hon. J. Humphery, M.P. Lord Mayor of London	

Physician—Dr. Jeaffreson, 2, Finsbury-square.
Surgeon—W. Coulson, Esq. 2, Frederick's-place, Old Jewry.
Consulting Actuary—Professor Hall, of King's College.

Advantages of the Argus Life Assurance Company.

Low Rates of Premiums.

In addition to the subscribed Capital of 200,000*l.* the assured have the security of the Company's Income of nearly 60,000*l.* per annum, yearly increasing, and an accumulating Assurance Fund invested in Government and other available Securities, of considerably larger amount than the estimated liabilities of the Company.

The Rates of Premium are reduced to the lowest scale compatible with the safety of the Assured and the stability of the Company, thereby, in effect, giving to *every* policy-holder an immediate and certain bonus without risk, in lieu of the deferred and frequently delusive prospect of a periodical division of profits.

Annual Premium to Assure £100.

Age.	For One Year.	For Seven Years.	Whole Term.
20	£0 17 8	£0 19 1	£1 11 10
30	1 1 8	1 2 7	2 0 7
40	1 5 0	1 6 9	2 14 10
50	1 14 1	1 19 10	4 0 11
60	3 2 4	3 17 0	6 0 10

One-third of whole-term Premiums may remain unpaid at 5 per cent. comp. int. as a debt upon the Policy for life, or may be paid off at any time without notice.

In Assurances for advances of money, as security for debts, or as a provision for a family, when the least present outlay is desirable, the varied and comprehensive Tables of the Argus Office will be found to be particularly favourable to the assured.

A Board of Directors, with the Medical Officers, attend daily, at a quarter before 2 o'clock.

EDWARD BATES, Resident Director.

A Liberal Commission to Solicitors and Agents.

THE FOREIGN AND COLONIAL REVIEW.

On the 2nd of October will be published, in 8vo. price 6s.

No. IV. OF

THE FOREIGN AND COLONIAL QUARTERLY REVIEW.

This Review has been established by a highly influential Literary and Mercantile Proprietary, under the Superintendence of the late Editor of the Foreign Quarterly Review, and has already obtained deserved reputation both for the vigour and information of its Articles—several of which have been publicly attributed to Members of our Government—and for the priority and accuracy of its Foreign Intelligence, which is secured through the influence of eminent Correspondents in our Colonies and on the Continent.

London: WHITTAKER & Co. Ave Maria-lane; and SMITH, ELDER & Co. 65, Cornhill.

THE SINGULAR SUCCESS which has attended the proceedings of the SCOTTISH WIDOWS' FUND AND LIFE ASSURANCE SOCIETY, is to be mainly attributed—

To the judicious selection of the Lives insured.
To the careful investment of the Funds.
To the equitable principles upon which the division of the Surplus Profits is made.
To the freedom from all burden in the way of Dividends to Proprietors.
To the promptitude and liberality of its dealings.
To the strict adherence to the utmost Economy, so far as consistent with the Efficient Conduct and Management of the Business.

Copies of the Prospectus, Forms of Proposal, and every necessary information, may be obtained at the Head Office, Edinburgh, or at any of the Society's Agencies.

JOHN MACKENZIE, Manager.

LONDON OFFICE, 7, Pall Mall,
HUGH M'KEAN, Agent.

ECONOMIC LIFE ASSURANCE SOCIETY,
No. 34, Bridge-street, Blackfriars, London: established 1823.
Empowered by Act of Parliament, 3 William IV.

Lower Rates of Premium than those of any other office that entitle the assured to participate in the profits.

The bonus declared in 1834 amounted upon an average to 16*l.* per cent. on the premiums then paid; and in 1839 a second bonus was awarded, amounting on the average to 31*l.* per cent. on the premiums paid during the preceding five years.

Prospectuses and other particulars may be obtained at the Office, between the hours of ten and four, or will be forwarded to persons resident in the country, on application.

CAMPBELL JAMES DOWNER, Sec.

VICTORIA LIFE ASSURANCE COMPANY.
Trustees.

Sir Jas. Duke, Ald. M.P. *Chairman*	Benj. Hawes, Esq. *Dep. Chairman*
Benj. Barnard, Esq.	Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus:—

Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.

Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.

Assurances may be effected *with* or *without* profits—on an ascending or descending scale, or for short periods.

Advances made to Assurers on real or undoubted personal security, for terms not exceeding three years, repayable by instalments.

Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary. WILLIAM RATRAY, Actuary and Secretary.

ANNUITIES.—In the AUSTRALASIAN COLONIAL AND GENERAL LIFE ASSURANCE AND ANNUITY COMPANY, Annuitants *participate in the profits of the Company*, and receive a rate of ANNUITY much more favourable than can be granted by any Company making its investments wholly in England. The Company is enabled securely to grant these favourable terms from the advantage it possesses of investing a portion of its funds at a high rate of interest.

Directors.

Edward Barnard, Esq. F.R.S.	C. E. Mangles, Esq.
Henry Buckle, Esq.	J. B. Montefiore, Esq.
John Henry Capper, Esq.	Richard Onslow, Esq.
Gideon Colquhoun, Esq.	William Walker, Esq.

Bankers—The Union Bank of London.
Colonial Bankers—The Bank of Australasia, (incorporated by Royal Charter, 1835,) No. 2, Moorgate-street.
Solicitors—Messrs. Swain, Stevens & Co.
Physician—Dr. Fraser, 62, Guildford-street.

Prospectuses, with Tables, Forms of Proposal for the purchase of an Annuity or for making an Assurance, and every information, may be obtained by application at the Office of the Company, No. 126, Bishopsgate-street, City.

EDWARD RYLEY, Sec.

THE DISSENTERS' and GENERAL LIFE and FIRE ASSURANCE COMPANY. Instituted 1837. Empowered by Special Act of Parliament, 3 Vic. c. 20., 62, King William-street, London Bridge, London; 21, St. David-street, Edinburgh; 6, King-street, Queen-square, Bristol; and St. Andrew's Hall, Plain, Norwich.—Capital, One Million.

Trustees and Directors.

George Bousfield, Esq.	Sir John Pirie, Bart. and Ald.
Thomas Challis, Esq.	Thomas Piper, Esq.
Sir J. Easthope, Bart. M.P.	Thomas B. Simpson, Esq.
Peter Ellis, Esq.	Edward Smith, Esq.
Joseph Fletcher, Esq.	Hon. C. P. Villiers, M.P.
Richard Hollier, Esq.	John Wilks, Esq.
Charles Hindley, Esq. M.P.	Edward Wilson, Esq.

On the return of the Michaelmas Quarter, the Directors beg leave to remind their Friends and the Public, that in the FIRE DEPARTMENT they receive risks of all descriptions, including Chapels, School-Rooms, Mills, Goods and Shipping in Dock, Farming Stock, &c., at the same reduced rates as other respectable Companies, and make no charge for Fire Policies transferred from other Offices; and in the LIFE DEPARTMENT they continue to transact all business relating to Life Assurances, Annuities, and Family Endowments, upon the most liberal terms consistent with sound principles and public security.

Loans also are granted on equitable terms to Life Assurers on Life Interests, or satisfactory personal securities. Particulars as to all the departments may be obtained from the principal Offices in London, Edinburgh, Bristol, and Norwich, and from the several Agents in most cities and towns in England, Scotland, and Wales; and to all Agents and Solicitors, Surveyors and Auctioneers, liberal allowances will be made.

By order of the Directors,
THOMAS PRICE, Secretary.

WESTERN LIFE ASSURANCE SOCIETY,
49, Parliament-street, Westminster.—Capital 500,000*l.*
Directors.

Henry Edgeworth Bicknell, Esq.	John Arscott Lethbridge, Esq.
William Cabell, Esq.	Edmund Lucas, Esq.
Thos. Somers Cocks, jun. Esq.	George Kennet Pollock, Esq.
George Henry Drew, Esq.	James Lys Seager, Esq.
William Evans, Esq.	John Bazley White, Esq.
William Freeman, Esq.	Joseph Carter Wood, Esq.
Francis Fuller, Esq.	Henry Wrench, Esq.
James Hunt, Esq.	

Physician—William Richard Basham, M.D.
Surgeons—Alfred Leggatt, Esq.; George D. Pollock, Esq.
Bankers—Messrs. Cocks, Biddulph & Co.
Solicitors—Messrs. J. L. Bicknell and J. C. Lethbridge.

The leading features of this Society are—

The very moderate Rate of Premium when viewed as combined with *perfect security* to the assured.

The advantage to the Assurers (by Table 2) of becoming entitled to *three-fourths* of the *profits*.

The assurance of a *certain bonus*.

The facility for *securing debts*.

The allowance of *half* the Annual Premium to remain unpaid for *seven years*, and

The accommodation of *temporary loans* to the Assured on available security. Immediate and deferred Annuities are granted by this Society on terms advantageous to the Public.

A liberal Commission allowed to Professional Gentlemen and Agents introducing business to the Office.

EDWARD T. RICHARDSON, Secretary.

WATCHES by WEBSTER & SON, Chronometer Makers to the Lords of the Admiralty, established 132 years. W. & Son have removed to 74, CORNHILL, where the advantages of the premises will enable them personally to superintend their workmen. An extensive Stock, finished with the utmost care, and at the lowest possible prices consistent with maintaining their reputation supported during so many years for the finest work; consisting of COMPENSATED DUPLEX and LEVER WATCHES, on the principle of their Chronometers, to which Government awarded the prizes three years in succession. The Detached Lever and Horizontal Watches for ladies, of the smallest and most elegant patterns. Marine and Pocket Chronometers with long and accurate rates, also a large selection of second-hand Chronometers and Watches by the most eminent makers. Superior workmen are employed on the premises in the repairing department, for English and foreign work.—Webster & Son, 74, Cornhill.

MOULD CANDLES to BURN WITHOUT SNUFFING.—KEMPTON'S PATENT.—These candles do not require snuffing; they burn longer and are cheaper than any other candle; the flame is steady and brilliant. No metallic or deleterious matter is used in the manufacture. Price 8*d.* per lb. Sold by G. E. Parish, agent for exportation, 71½, Bread-street, City, and by Slodden & Stocking, 42, High-street, Marylebone; W. Gethem, Broadley-terrace, Blandford-square; W. Evans, Italian warehouse, Greenwich; John Hawkins, grocer, High-street, Whitechapel; George Bawley, grocer, Pitfield-street, Hoxton; S. Game, Fish-street-hill; J. Pain, grocer, Bethnal-green-road; G. H. Hudson, 229, Blackfriars-road; C. H. Nicholas, 19, Bolingbroke-row, Walworth; and at the manufactory, Old Bargehouse, Christchurch, Surrey.

COMPOSITION FOR WRITING WITH STEEL PENS.
STEPHENS' WRITING FLUID.

THESE COMPOSITIONS, which have so remarkably extended the use of the STEEL PEN, are brought to very great perfection, being more easy to write with, more durable, and in every respect preferable to the ordinary Ink. In warm climates they have become essential. They consist of—An INSTANTANEOUS BLACK INK—A BLUE FLUID, changing to an intense Black colour—PATENT UNCHANGEABLE BLUE FLUIDS, remaining a deep Blue colour—A SUPERIOR BLACK INK, of the common character, but more fluid—A SUPERIOR CARMINE RED for Contrast Writing—A CARBONACEOUS RECORD INK, unchangeable by any Chemical Agent—Also, a new kind of MARKING INK for Linen; and Inkholders adapted for preserving Ink from Evaporation and Dust. Bottles at 3*d.* each, convenient for writing from, are prepared, which will enable those who may wish to try either of these articles to do so at a small expense. Prepared by HENRY STEPHENS, the Inventor, 54, Stamford-street, Blackfriars-road, London; and sold by Stationers and Booksellers.—N.B. These unchangeable Blue Fluids are Patent Articles; the public are therefore cautioned against imitations, which are infringements; to sell or use which is illegal.

STEPHENS' SELECT STEEL PENS.—The utmost possible care having been bestowed upon the manufacture of these articles so as to procure the highest finish, they can be confidently recommended both for flexibility and durability.

ELECTRO-PLATED and GILT ARTICLES.—ELKINGTON & CO., Patentees, gratefully acknowledging the distinguished patronage the articles of their manufacture have hitherto received, beg to announce that their stock, embracing every variety of NOVELTY for the SIDEBOARD, DINNER, DESSERT, and BREAKFAST TABLE, may be inspected at their Establishments,

WEST-END,—22, REGENT-STREET, corner of Jermyn-street.
CITY,—45, MOORGATE-STREET.

The Patentees beg expressly to state, that their electro-plated goods differ entirely from any hitherto offered to the public as 'plated goods,' or 'substitutes for silver.' Both in appearance, sound, and wear, these goods are equal to SOLID SILVER: they are cast and chased in SOLID WHITE METAL, and strongly plated with silver by their PATENT ELECTRO PROCESS; all joints are made with hard silver solder, which cannot be used in ordinary plated goods, and neither acids nor heat affect them.

Their ELECTRO-GILDING, for beauty of colour and facility of application to ALL METALS, is much superior to the old method of water-gilding.

Old Sheffield plate restored and re-plated; plating and gilding, ou old or new articles, promptly executed, at the Manufactory, 45, Moorgate-street.

Every article made and warranted by the Patentees bears their stamp, E. & Co. over a crown.

STONE-COLOURED CEMENT.

FELIX AUSTIN, of the New Road, Regent's Park, begs to inform Architects, Builders, Plasterers, &c. that during the process of manufacturing a very superior composition which has greatly improved his well-known Artificial Stone Ornaments, he has succeeded in making an excellent STONE-COLOURED CEMENT, adapted to building, more especially for facing brick walls and repairing decayed stone work, which he can supply at 2*s.* 6*d.* per bushel, at his Manufactory, near the Thames Tunnel, Rotherhithe.

H. WALKER'S NEEDLES (by authority The 'Queen's Own') in the illustrated Chinese boxes, are now in course of delivery to the trade. The needles have large eyes, are easily threaded (even by blind persons), and have improved points, temper, and finish. Each paper is labelled with a likeness of her Majesty or his Royal Highness Prince Albert, in relief on coloured grounds. Every quality of needles, fish-hooks, hooks and eyes, steel pens, &c., for shipping. These needles or pens for the home trade are sent, free, by post, by any respectable dealer, on receipt of 13 penny stamps for every shilling value.—H. Walker, Manufacturer to the Queen, 20, Maiden-lane, Wood-street, London.

F. ARNOLD'S

INDELIBLE MARKING INK, for Silk, Linen, and Cotton, which requires no preparation, and is warranted not to injure the finest fabric.

In neat cases, with directions for use.....1*s.* each.
Superior India Rubber Court Plaister, in cases..... 6*d.* and 1*s.*
Purified Violet, Camphor, and Charcoal Tooth-powder, recommended by the faculty, in boxes .. 6*d.* and 1*s.*
Medicated Pomatum, strongly recommended for the nursery and toilet, in pots..... 6*d.*

To be had of every respectable Stationer and Chemist in Town and Country.—Wholesale and Export Warehouse, 12, Curzon-street, May Fair.—Be particular in asking for F. Arnold's, as none other is genuine.

THE OMBROSOME, or PATENT PORTABLE SHOWER BATH, especially adapted for travelling and exportation. By this Bath an inexhaustible shower is produced from a few quarts of water: the height of the shower may be increased or lessened to suit adults or children, and occupying so little room, is peculiarly suited for bed-rooms and dressing-rooms; it is also an excellent Douche Bath. Being little larger than a writing-desk when packed, it will be a great desideratum for exportation to India and other hot climates. To Military Men and others of a migratory life, also to Students of the Universities, Inns of Court, &c. (where rooms are low and water scarce), the present invention cannot fail to be most acceptable. It is made entirely of brass, and is at once simple and elegant.—May be seen at the Royal Polytechnic Institution; and be had, with Prospectuses, wholesale and for exportation, at the Manufactory, 115, Old-street; and retail at the Bazaar, Panklibanon Iron Works, 56, Baker-street; Mr. J. L. Benham, 19, Wigmore-street; Mr. C. Bray, 16, Cranbourne-street; Mr. J. Deacon, 4, Moorgate-street; Mr. J. Evans, London Bridge; Messrs. Fallows & Adcock 4, Halkin-street West; Messrs. Glenton & Chapman, 147, New Bond-street; and of all the leading Ironmongers throughout England.—Price 4*l.* 10*s.* and 5*l.* 5*s.*

TO MERCHANTS, FACTORS, IRONMONGERS, AND OTHERS.

THE OMBROSOME, or PATENT PORTABLE SHOWER BATH, peculiarly adapted for Travellers and Exportation.—This Bath is distinguished from every other by its combination of force with portability, its entire freedom from the dark and suffocating properties of the latter, the inexhaustible stream it produces from a few quarts of water, and the facility which it gives for converting the common fresh water shower into a saline or any other variety of bath. The height of the shower may be increased or lessened. It is also an excellent Douche Bath. Being nearly as small as a writing desk when packed, it will be found very advantageous for exportation. The apparatus is made entirely of brass, and beautifully finished and lackered. Manufacturers, Messrs. YATES & BIRCH, 42, Coleshill-street, Birmingham. May be seen at the Royal Polytechnic Institution, London; and be had at Messrs. Mapplebeck & Lowe, Bull Ring, Birmingham, and all the principal Ironmongers in the Kingdom. Price 4*l.* 10*s.*, and 5*l.* 5*s.*

BUTTER MADE IN TEN MINUTES, by the NEWLY-INVENTED CHURN, registered according to Act of Parliament.

ATTWOOD, WIMBLE & WARNER, Manufacturers, Lewes, Sussex.

This CHURN being made entirely of Block Tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which insures the butter coming in ten or twelve minutes. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use. The great advantages of this Churn will be found in the winter; but in the summer, placing the churn in cold water will be the means of hardening the butter.

Sizes,	No. 1.	2,	and 3.
Churn from	7 to 8 lbs.	13 to 15 lbs.	26 to 28 lbs.
Price, carriage paid to London,	25*s.*	35*s.*	42*s.*

Metal Pans for Churns to stand in, 4*s.* 6*d.*, 6*s.*, and 7*s.* Larger sizes made to order.

To be seen in London, at Wright's Range Warehouse, No. 3, Arthur-street, near the Monument; W. Baily & Son, Furnishing Ironmongers, 71, Gracechurch-street; Livermore & Son, Ironmongers, No. 20, Oxford-street; Benham, 19, Wigmore-street, Cavendish-square. Export Agents, Barnes & Co., 109, Fenchurch-street.

LEA & PERRIN'S 'WORCESTERSHIRE SAUCE.' Prepared from the Recipe of a Nobleman in the County.—The above celebrated Sauce has, from the time of its introduction, been steadily progressing in public favour. Its peculiar piquancy, combined with exquisite flavour, establish it of a character unequalled in sauces. Noblemen and others, of acknowledged goût, pronounce it to be 'the only good sauce;' and for enriching gravies, or as a zest for fish, curries, steaks, game, cold meat, &c., especially unrivalled. As a rapidly-increasing inquiry is now made for it in all parts of the kingdom, the Proprietors beg to state that druggists, grocers, and others may be supplied by their agents—Messrs. Barclay & Sons, Farringdon-street; Mr. J. Harding, 59, King-street, Stepney; Messrs. Metcalfe & Co. 16, Southampton-row; and by the Wholesale Oil and Italian Warehousemen in London, upon the same terms as at their Warehouse at Worcester.—Sold retail, in half-pint bottles, at 1*s.* 6*d.*; pints, 2*s.* 6*d.*; and quarts, 5*s.* each, with the Proprietors' stamp over the cork of every bottle.

FOR GOUT, RHEUMATISM, AND RHEUMATIC GOUT.

SIMCO'S GOUT and RHEUMATIC PILLS are a certain and safe remedy; they restore tranquillity to the nerves, give tone to the stomach and strength to the whole system. No other medicine can be compared to these excellent pills, as they prevent the disorder from attacking the Stomach or Head, and have restored thousands from pain and misery to health and comfort. Sold by A. Willoughby & Co., late B. G. Windus, 61, Bishopsgate Without, and nearly all Medicine Venders, at 1*s.* 1½*d.* or 2*s.* 9*d.* per box.

Published by Grant & Griffith, Successors to J. Harris, St. Paul's Churchyard.

CITY ABUSES.—The Trust Estates held in the City for public and charitable objects produce an annual sum of 364,096l. 11s. 9½d. Notwithstanding these princely endowments, the local rates collected for the relief of the poor, for the Church, paving, watching, lighting, &c., are a heavier burden upon the inhabitants than exists in any district of corresponding extent in the United Kingdom, amounting for the year 1841 to 274,788l. 4s. 5d., besides Octroi duties or taxes upon coals, provisions, &c., levied by the Corporation upon the public at large to the amount of 202,549l. 12s. 7d. per annum. For an account of the mode in which these enormous funds are raised and expended in an area embracing only 1-15th section of the Metropolis, see a Pamphlet entitled 'THE CORPORATION OF LONDON AND MUNICIPAL REFORM,' reprinted by subscription from the *Westminster Review*. Price 6d.

William Blackwood & Sons, 45, George-street, Edinburgh; and 22, Pall Mall, London

Cheap Literature for all Classes of Readers in the British Dominions.

Dedicated, by permission, to
THE RIGHT HONOURABLE LORD STANLEY,
SECRETARY OF STATE FOR THE COLONIES;
AND
THE RIGHT HONOURABLE W. E. GLADSTONE,
PRESIDENT OF THE BOARD OF TRADE.

MR. MURRAY'S
COLONIAL AND HOME LIBRARY.

THE main object of this undertaking is to furnish the Inhabitants of the Colonies of Great Britain with the highest literature of the day, consisting partly of original Works, partly of new editions of popular Publications, at the lowest possible price. It is called for in consequence of the Acts which have recently passed the British Parliament for the protection of the rights of British authors and publishers, by the rigid and entire exclusion of foreign pirated editions. These Acts, if properly enforced, will, for the first time, direct into the right channel the demand of the Colonies for English Literature—a demand of which our authors and publishers have hitherto been deprived by the introduction of piracies from the United States, France, and Belgium. In order, therefore, that the highly intelligent and educated population of our Colonies may not suffer from the withdrawal of their accustomed supplies of books, and with a view to obviate the complaint that a check might in consequence be raised to their intellectual advancement, Mr. Murray has determined to publish a series of attractive and useful works, by approved authors, at a rate which shall place them within reach of the means not only of the Colonists, but also of a large portion of the less wealthy classes at home, who will thus benefit by the widening of the market for our literature: and the 'Colonial Library' will consequently be so conducted that it may claim to be considered as a 'Library for the Empire.' Owing to the very low price placed upon the numbers of this Series, the undertaking can succeed only if it meets with strenuous support from the Colonial Government at home and abroad, in giving effect to *the law*, and in supporting the just rights of British genius, industry, and manufactures, by preventing illicit importation of foreign reprints. It is also necessary for its progress and success that it be favoured with the patronage of the reading public in all parts of the British dominions; and the chief aim and object of the publisher will be to render it worthy of their countenance.

Mr. Murray's 'Colonial Library' will furnish the settler in the backwoods of America, and the occupant of the remotest cantonments of our Indian dominions, with the resources of recreation and instruction, at a moderate price, together with many new books, within a short period of their appearance in England; while the student and lover of literature at home, who has hitherto been content with the loan of a book from a book-club, or has been compelled to wait for its tardy perusal from the shelves of a circulating library, or perhaps has satisfied his curiosity by the scanty extracts in magazines or reviews, may now become possessed of the work itself, at the moment of its publication, and at a cost little beyond that entailed by either of the methods above mentioned. He may at the same time lay up a permanent Library in a condensed and portable form.

The series of Works designed to appear in Mr. Murray's 'Colonial and Home Library' will be selected for their acknowledged merit, and will be exclusively such as are calculated to please the most extensive circle of readers. They will be printed most carefully, in a superior style, and on good paper.

BORROW'S BIBLE IN SPAIN;
OR, THE
JOURNEYS, ADVENTURES, and IMPRISONMENTS of an ENGLISHMAN in an Attempt to CIRCULATE the SCRIPTURES in the PENINSULA.

Part I. Price HALF-A-CROWN (to be completed in Two Parts),
FORMS
No. I. OF MURRAY'S
COLONIAL AND HOME LIBRARY,
And will be published on the 2nd of October.

Sir Robert Peel in the House of Commons, April 11, 1843.

"Difficulties!! were they to be deterred from proceeding on that account? Let them look at Mr. Borrow; why if he had suffered himself to be prevented from circulating the Bible in Spain by the difficulties he met with, he could never have spread such enlightenment and information through that country."

JOHN MURRAY, Albemarle-street.

MR. RIPPINGILLE'S ARTIST and AMATEUR'S MAGAZINE for OCTOBER, royal 8vo. price 1s. contains:—On the Character and Influence of Landscape Painting—Assault on Opinion—Letter from a Correspondent, signed M. FRESCO AND ENCAUSTIC ORNAMENTAL PAINTING.

MR. FREDERICK SANG, Artist, from the Royal Academy at Munich, begs to inform the Nobility and Gentry (Architects particularly), that he continues, with a considerable number of his Pupils, to decorate Public and Private Buildings in the above manner, and in the different ancient and modern styles, on reasonable terms, and with the greatest dispatch. Orders executed in all parts of the United Kingdom.—Apply by letter to Mr. Frk. Sang, 27, Porland-terrace, Regent's-park, London.

TO ENGRAVERS.—The Committee of the ART-UNION of LONDON invite Engravers to send them Proposals for executing, in Line, a Copper-plate Engraving of Mr. O'NEIL'S Picture, 'JEPHTHA'S DAUGHTER,' of the size of 23 inches by 18 inches, to be completed by January, 1846. Specimens to be sent in with the Tenders on Monday, the 9th of October. The Committee reserve to themselves the selection of the Engraver, whose character and talents are most likely to insure the execution of a work of art honourable to the Fine Arts of the country, and creditable to the Society. The Picture may be seen at the Office, No. 4, Trafalgar-square, between the hours of Ten and Four.

GEORGE GODWIN, F.R.S. F.S.A. } Honorary
LEWIS POCOCK, F.S.A. } Secretaries.

26th Sept. 1843.

ART-UNION of LONDON, 4, TRAFALGAR-SQUARE.

President—His Royal Highness the Duke of Cambridge.

Vice-President—The Most Noble the Marquis of Northampton, P.R.S.

Subscribers of the current year will receive for each Guinea paid, in addition to the chance of obtaining a valuable Work of Art, an impression of a fine Engraving by Mr. E. Goodall, from the Picture by Clarkson Stanfield, R.A., 'CASTELLO D'ISCHIA,' and a series of 22 Designs in Outline, engraved by Mr. Henry Moses, from Original Drawings made expressly for the Society by Mr. H. C. Selous, illustrative of the 'PILGRIM'S PROGRESS.' Several of the Outlines are already engraved, and the Committee invite an immediate subscription to enable them to make the necessary arrangements for their prompt distribution.

The Engraving, after Hilton's 'UNA ENTERING THE COTTAGE,' due to the Subscribers of 1842, may now be obtained at the Office, on presentation of the "order," by those who have not already received the print.

GEORGE GODWIN, F.R.S. F.S.A. } Hon. Secs.
LEWIS POCOCK, F.S.A. }

BULL'S NEW SYSTEM, AND SELECT LIBRARY CATALOGUE.

Describing all the Valuable and Interesting Modern Publications to the present time, with the NEW SYSTEM and TERMS on which FAMILIES, READING SOCIETIES, and BOOK CLUBS, are regularly supplied with whatever New and Standard Works, Magazines, and Reviews they may desire for Perusal, which are sent in any quantity throughout England, Scotland, and Ireland. Apply for the above to Mr. Bull, English and Foreign Public Library, 19, Holles-street, four doors from Cavendish-square, London.

Now ready, gratis, and post free.

HINTS for the FORMATION of READING SOCIETIES.

The plan advocated in this little pamphlet will effect two important objects—that of adding to the supply of the current literature, the choice of all the most valuable works in the various languages, and that of extending the choice of New Books to the entire productions of the Press. It is especially adapted to provincial readers, as by a small annual subscription the perusal of all the new works as they appear may be obtained.

Saunders & Otley, Publishers, Conduit-street,

Of whom may be had gratis and post free,

A New List of the Redundant Copies of New Publications in History, Biography, Memoirs, Travels, Novels, &c., withdrawn from Saunders & Otley's extensive Library, Conduit-street, Hanover-square.

HORNE & CO.'S PUBLIC SUBSCRIPTION LIBRARY, No. 105, CHEAPSIDE, London, consisting of a Collection of upwards of 50,000 Volumes of Works, by the best Authors, in the various departments of Literature.

Terms of Subscription.—Subscribers of 5l. 5s. per annum; 3l. 3s. the half year; or 1l. 14s. the quarter, are entitled to 18 vols. at a time, in Town, or 24 vols. in the Country.—4l. 4s. per annum; 2l. 10s. the half year; or 1l. 8s. the quarter, 12 vols. in Town, 16 in the Country.—3l. 3s. per annum; 1l. 16s. the half year; or 1l. 1s. the quarter, 8 vols. in Town, 12 in the Country.—2l. 2s. per annum; 1l. 6s. the half year; or 15s. the quarter, 4 vols. in Town, 6 in the Country.—The New Publications are added to the Library as they issue from the press; from which Subscribers may select one-half their complements.

BOOK SOCIETIES, or Families desirous of entering into a joint subscription, can be supplied with any number of books, entirely new, and of their own selection, whether in the Library Catalogue or not, upon the following terms:—If 30 volumes be required constantly in circulation among the members, 12l. 12s. per annum. And if a greater or less number be required, the same rate in proportion. The Books to be exchanged at the time and in the way best suited to the convenience of the members; the Society paying carriage to and from London.

*** Subscriptions to be paid in advance.

This day, price Eighteen-pence,

A KEY to the 'GIFT of FRENCH CONVERSATION.' By Mons. LE PAGE, Author of 'L'Echo de Paris,' &c.

This new little book, intended to assist those ladies and gentlemen who, after having left school, are desirous of being able to converse in French, and the tutors and governesses who wish to teach it, will, it is presumed, be found very desirable; as, while the original work supplies them with a large stock of English words and phrases of daily use in familiar conversation, *the Key to it gives them the correct* translation of the same into French, thereby showing them which is the proper expression for every topic of life.

Effingham Wilson, 18, Bishopsgate-within; Longman & Co.; and all Booksellers.

RECONNOITERING TELESCOPES.—These beautiful Instruments, measuring but 3¼ inches when closed, possess sufficient power to show clearly Jupiter's moons: price 35s. Securely packed, and sent through the post for 1s.—To be had only of the Maker, JOHN DAVIS, Optician, Derby; or at the Establishment of his Brother, High-street, Shrewsbury.

Achromatic Objectives.—J. D. has just received from M. Oberhæuser, Paris, a series of fine Objectives for Microscopes; of their performance J. D. can give the first reference. The price varies from 2l. to 3l.

To Agriculturists.—J. D. has just constructed a highly efficient Level for Draining and Irrigating, price 3l. 5s.

SMOKE PREVENTED, and VENTILATION EFFECTED, by SPONTANEOUS ACTION.—Mr. JEAKES, 51, Great Russell-street, Russell-square, *Sole Agent in London* for the sale of DAY'S PATENT WINDGUARD, by the use of which he guarantees to cure all Chimneys smoking from wind, and also to prevent downward currents. It is admirably adapted for the ventilation of apartments of every description; also of ships, stables, dairies, and larders, as it ensures a constant change of air; and all its parts being fixtures, it is free from noise, and not liable to derangement. It also offers no impediment to sweeping. Price, for general use, 30s.; larger size, 45s.; larger sizes, especially adapted for ventilation, 60s. and upwards. To be had at 51, Great Russell-street, where it may be seen in action. The attention of Architects, Builders, and the Trade in general, is especially invited.
